Sir, War Office, 9 May 1863.

I have the honor to transmit herewith Her Majesty's Warrant, appointing a Royal Commission to inquire into the claims of certain Officers referred to therein; and Her Majesty, having been graciously pleased to nominate you as the Chairman of the said Royal Commission, I am to request you will convene an early meeting of the Commissioners, for the dispatch of the business for which the Commission has been appointed.

I have the honor to be, Sir,

Your obedient Servant,

The Right Hon. Lieut.-Gen. J. Peel, M.P., De Grey & Ripon.

# COMMISSION.

*VICTORIA* R.

**Victoria**, by the Grace of God of the United Kingdom of Great Britain and Ireland Queen, Defender of the Faith.

**To** Our right trusty and well-beloved Councillor, Jonathan Peel, Esquire, Lieutenant-General of our Forces, Our right trusty and well-beloved Councillor, Edward Pleydell Bouverie, Esquire, commonly called the Honourable Edward Pleydell Bouverie, Our trusty and well-beloved Sir Alexander Woodford, Knight Grand Cross of Our Most Honourable Order of the Bath and Knight Grand Cross of Our Most Distinguished Order of St. Michael and St. George, General of Our Forces, Our right trusty and well-beloved Councillor, Sir George Brown, Knight Grand Cross of Our Most Honourable Order of the Bath, General of Our Forces, Our right trusty and right well-beloved Cousin and Councillor, James Alexander Earl of Rosslyn, Lieutenant-General of Our Forces, Our trusty and well-beloved Sir William Brereton, Knight Commander of Our Most Honourable Order of the Bath, Major-General of Our Forces, Our trusty and well-beloved Henry Sandham, Esquire, Major-General of Our Forces, Our trusty and well-beloved David Russell, Esquire, Companion of Our Most Honourable Order of the Bath, Major-General of Our Forces, Our trusty and well-beloved Randal Rumley, Esquire, Major-General of Our Forces, Greeting.

**Whereas** We thought it expedient by Our Royal Presents, dated the 12th Day of April 1858, to authorize and appoint a Commission to inquire into the working of the System of Promotion recommended in the Report of a Royal Commission of 1854, and into the Question of Promotion and Retirement in the higher Ranks of the Army, commencing with the Rank of Major.

**And** whereas it has been represented to Us that 21 Officers who were promoted to the Rank of Colonel in the Years 1855 and 1856 as Our Aides-de-Camp and for distinguished Service in the Crimean War, consider that by the Operation of the Royal Warrant of 14th October 1858, founded on the Recommendation of the Royal Commission of 1858, they have been deprived, to an undue Extent, of the Position they attained by the Promotion conferred upon them.

**And** whereas it has also been represented to Us that certain Captains and Lieutenant-Colonels of the Guards, who were promoted to that Rank between the 20th June 1854 and the issuing of the Warrant of 6th October of that Year, consider that their Positions in the Army have been unduly injured by the Operation of the said Warrant of 6th October 1854, and also by the subsequent Warrant of 14th October 1858.

Now We, reposing great Trust and Confidence in your Zeal, Discretion, and Ability, have authorized and appointed, and do by these Presents authorize and appoint you, the said Jonathan Peel, the Honourable Edward Pleydell Bouverie, Sir Alexander Woodford, Sir George Brown, James Alexander Earl of Rosslyn, Sir William Brereton, Henry Sandham, David Russell, and Randal Rumley, to be Our Commissioners to inquire into the Claims of the said Officers.

And We do hereby authorize and empower you, Our said Commissioners, or any Three or more of you, to obtain Information thereupon, by the Examination of all Persons most competent by reason of their Knowledge, Habits, or Experience to afford it; and also by calling for all Documents, Papers, or Records which may appear to you, or any Three or more of you, calculated to assist your Researches and to promote the Formation of a sound Judgment on the Subject.

And We do hereby command and require you, or any Three or more of you, to report to Us, under your Hands and Seals, with all convenient Speed, your Opinion whether these Officers are entitled to any Redress, and if so, to recommend in what Form such Redress should be accorded to them.

And We will and command, and by these Presents ordain, that this Our Commission shall continue in full Force and Virtue, and that you Our said Commissioners, or any Three or more of you, may from Time to Time proceed in the Execution thereof, and of every Matter and Thing therein contained, although the same be not continued from Time to Time by Adjournment.

We further will and command that Our right trusty and well-beloved Councillor, Jonathan Peel, Esquire, Lieutenant-General of Our Forces, be appointed Chairman of this Our Commission.

And for your further Assistance in the due Execution of these Presents, We have made choice of Our trusty and well-beloved Thomas Cave-Browne-Cave, Esquire, to be Secretary to this Our Commission, whose Services and Assistance We require you to use from Time to Time as Occasion may require.

Given at Our Court at Osborne House, Isle of Wight, this Eighth Day of May One thousand eight hundred and sixty-three, in the Twenty-sixth Year of Our Reign.

By Her Majesty's Command,

DE GREY AND RIPON.

---

This Commission was published in a supplement to the "London Gazette," on 9 May 1863, with the following notice:—

N.B.—It is requested that any officer whose interests may be affected by the above, and who wishes to be examined by, or to make any statement to the Commissioners, will forward his application to Mr. Cave, at the War Office, with the least possible delay.

## LETTER TO SECRETARY OF STATE FOR WAR, FORWARDING REPORT, &c.

My Lord, War Office 15, June 1863.

With reference to your Lordship's letter of the 9th ultimo giving cover to the Queen's Commission of 8th May 1863, issued for the purpose of an inquiry into the claims of certain Colonels in the Army and Captains and Lieutenant-Colonels of the Foot Guards, I have the honour to transmit to your Lordship, for submission to Her Majesty, the Report of the Commissioners which has been duly signed by each member, with the exception of Sir George Brown, who is the only dissentient, and whose dissent, together with a Memorandum which he has annexed, I have also the honor to forward for Her Majesty's information.

I have the honour to be, my Lord,

Your Lordship's obedient Servant,

The Right Hon. The Earl de Grey & Ripon,
Secretary of State for War.

J. PEEL,
*Chairman.*

# REPORT.

## TO THE QUEEN'S MOST EXCELLENT MAJESTY.

We, Your Majesty's Commissioners, having been appointed by Your Majesty's Commission, bearing date the 8th May 1863, to inquire into the claims of certain of Your Majesty's Aides-de-Camp, Colonels promoted for distinguished service, and Captains and Lieutenant-Colonels of the Foot Guards, as regards the operation of the Royal Warrants of 6th October 1854, and 14th October 1858, which were founded upon the recommendations of Royal Commissions, do humbly certify to Your Majesty that:

We have fully considered all the circumstances of the case, and have made a most searching inquiry into the claims of the officers referred to us, both by the examination of all witnesses, from whom it was hoped that information on the subject could be obtained, and by reference to various returns and documents furnished to us, and we find that;

Previously to the 20th June 1854 all officers who had attained the rank of Lieutenant-Colonel in the army were promoted to be Colonels by seniority, and an officer having reached the rank of Lieutenant-Colonel had an acknowledged right to expect that no promotion of any junior officer should be made over his head.

The only exceptions to this rule were as follows, viz.: Officers, being Lieutenant-Colonels, who were appointed Aides-de-Camp to the Sovereign, and were made Colonels without reference to the seniority of other Lieutenant-Colonels, and the case (which does not affect the present question) of certain grades in the Household Troops, Artillery, and Engineers, and Foot Guards, which carried with them the rank of Colonel.

In 1854 a Royal Warrant changed this rule and practice, and introduced two new methods of promotion to the rank of Colonel, without reference to seniority, viz.: by three years' service in the rank of Lieutenant-Colonel as described in that Warrant, and as a reward for distinguished service.

These two methods of obtaining promotion to the rank of Colonel were entirely new, and in contravention of the previous rule.

The Commissioners of 1854, on whose report the Warrant in question was framed, recommended that these changes should be accompanied by protection to the vested interests in the old system of promotion by seniority, to the advantage of which they thought the officers who were Lieutenant-Colonels at the time of the introduction of these changes, were justly entitled.

It will be observed, however, that this protection would not have embraced a security against the promotion of such of Your Majesty's Aides-de-Camp as were made Colonels over the heads of their seniors agreeably to an old-established rule.

Had the recommendation of the Commissioners been complied with, and had all officers who were Lieutenant-Colonels at the time of the introduction of the change been *then* made Colonels so as to preserve their seniority over those promoted under the new system, these officers would have been effectually secured against the injury which the change was calculated otherwise to inflict upon them.

The same object might have been effected by providing that no officer should be made a Colonel under either of the new rules without the concurrent promotion of all the Lieutenant-Colonels who were senior to him on the 20th June 1854.

The recommendation of the Commissioners was entirely overlooked in carrying into effect the changes they suggested, and hence a number of Lieutenant-Colonels who obtained their promotion to be Colonels subsequently to November 1854, either for three years' service, or for distinguished service, or as Your Majesty's Aides-de-Camp, passed over the heads of Lieutenant-Colonels senior to themselves.

The injustice apprehended by the Royal Commissioners of 1854 was felt to such an extent that another Royal Commission was appointed in 1858 to consider how it might be remedied.

This Commission considered the case of the officers thus affected, and also the case of those officers who had been promoted under the new rules in the interval between 1854 and 1858, amongst whom were comprised the 21 officers promoted to the rank of Colonel in the years 1855 and 1856 as Your Majesty's Aides-de-Camp, and for distinguished service in the Crimean War, whose position in the army has been referred to our consideration by Your Majesty.

The Commissioners of 1858 were of opinion that the protection which was recommended in 1854 to be given to the officers who were Lieutenant-colonels prior to 20th June 1854, against the consequences of the changes then introduced, should have been afforded *at that time* by making all such officers Colonels with Commissions bearing date the 28th November 1854, being the date of the introduction of the new system by the first promotions ander it.

The Commissioners made their Report and recommendation to Your Majesty accordingly.

A new Warrant was thereupon framed bearing date 14th October 1858, in strict conformity with their recommendation, and the officers who were Lieutenant-Colonels prior to 20th June 1854, now stand in the Army List having their Commissions as Colonels dated 28th November 1854, and in precedence of the Colonels who were junior to them as Lieutenant-Colonels, and who had obtained their Commissions under the new rules promulgated in the Warrant of 1854.

So great is the evil of creating doubt and uncertainty in the Army by altering the positions of officers attained through the provisions of Royal Warrants, that we now humbly submit to Your Majesty that no alteration should take place in the present relative position of the Colonels whose Commissions were antedated to 28th November 1854, under the Warrant of 1858, and of officers appointed Aides-de-Camp to Your Majesty, or Colonels for distinguished service between 6th October 1854 and 14th October 1858, and we are of opinion that the recommendations of the Royal Commission of 1858 should be adhered to.

In this decision we include the cases of certain Captains and Lieutenant-Colonels of the Foot Guards who were promoted to that rank between the 20th June 1854 and the issuing of the Warrant of the 6th October of that year, although we consider that the interests of these officers were more seriously affected by the change introduced by that Warrant than could have been anticipated at the period.

We humbly submit this our Report to Your Majesty's gracious consideration.

THOS. C. B. CAVE, Secretary,
War Office, Pall Mall, 15 June 1863.

---

I dissent from the opinion come to by the majority of the Commission, and have declined to sign their report for the reasons assigned in my Memorandum of 22nd May, attached to the proceedings.

War Office, 28 May 1863.

G. BROWN,
*General.*

---

## Memorandum by General Sir G. Brown.

It appears to me that the whole difficulty as regards the places of the Queen's aides-de-camp and of the officers who have been called the "Distinguished Service Colonels" on the list of the Colonels of the Army has arisen from a succession of administrative oversights and inadvertences, which it becomes the duty of this Commission to investigate, and to endeavour to correct, before it can expect to adjust the question submitted to its consideration in a satisfactory manner.

The Royal Commission of 1854 proposed that from and after the 20th June in that year the system of promotion by general brevets should be abolished, and that thenceforth, in order to attain to the rank of colonel, lieutenant-colonels should be required to serve *three* years in command of a regiment or battalion, or in some staff appointment necessarily held by an officer of the rank of lieutenant-colonel; but in introducing this change into what had hitherto been the practice of the Army, the Commisioners at the same time recommended that the claims and interests of the then existing lieutenant-colonels should be carefully protected from injury, and that they should not have their just expectations disappointed.

Now it is not reasonable to suppose that by this recommendation it was proposed that these lieutenant-colonels should be protected from the operation of the long established practice and prescriptive right of the Sovereign to select Her aides-de-camp, and to confer on them, when so selected, the rank of colonel, without reference to their position on the list, but rather that it should be taken in its natural and ordinary sense, and that the intention was that the officers in question should not be liable to be passed over by their juniors under the *three years rule*.

However this may be the recommendation of the Commission, as would seem, from some inadvertence, does not appear to have been carried out or embodied in the warrant grounded on its report; and accordingly all the lieutenant-colonels appointed prior to the 20th June 1854, who had not qualified as above stated, remained for some years subject to be (and actually were) passed over by many of their juniors who happened to have the advantage of being in command of regiments, &c. until a second Commission issued in 1858, as is understood, for the express purpose of rectifying these complaints and grievances.

This last Commission, without apparently adverting to the case of officers who, for distinguished service in the field, or for whatever other cause, might have been promoted in the interim, rather precipitately, and, as would seem without sufficient consideration, recommended that all the lieutenant-colonels appointed prior to the 20th June 1854 should be at once promoted to the rank of colonel, antedating their appointments to the common date of the 28th November of that year.

It may be here observed that there were two obvious modes of carrying out to the fullest extent the recommendation of the Commission of 1854, of keeping faith with and affording redress to the lieutenant-colonels who had been passed over, without doing the slightest injury or injustice to others; but on the contrary either of which would have been considered a great boon at the moment to all the parties concerned.

The first of these measures was to have declared that, whenever any lieutenant-colonel should become qualified for promotion to the rank of colonel under the new rule, all those standing senior to him on the list should be promoted at the same time; by which means the whole list of lieutenant-colonels would have been absorbed in the course of three years.

The second mode of proceeding was to have treated them all as if they had been actually employed, and to have announced that all the existing lieutenant-colonels alike should obtain the rank of colonel after completing three years in the subordinate rank, whether on half-pay or otherwise.

It is not reasonable to suppose that it could have been proposed at that time to adopt the sweeping and apparently gratuitous measure subsequently introduced, on the recommendation of the Commission of 1858, and which has given rise to the present difficulty, because its effect would have been to exhaust the whole list of lieutenant-colonels, and to leave the army without any officers of that rank, and also because some of these officers had only held the rank of lieutenant-colonel for a few months.

It seems to me, therefore, that what we have to do is to correct the error that the last-mentioned Commission appears inadvertently to have fallen into, and by a revisal of the dates of appointment of these officers, to effect such an adjustment of their relative positions in the list as may seem equitable and prove satisfactory to the rest of the army, if it should not exactly meet the views of both parties to the dispute.

On the principle, therefore, that those who from inadvertence, or from whatever other cause, may have come into possession of what they were not fairly entitled to claim, or have any just right to retain, may be required to make restitution, I would propose (adopting the second expedient as the most simple) that the colonels from Colonel Irwin down to Colonel White be treated as if they had all alike *duly qualified for promotion*, and take rank in the Army List as colonels from dates respectively *three* years subsequent to the dates of their lieutenant colonelcies, and that Her Majesty's aides-de-camp and the colonels promoted for distinguished service in the field be allowed to fall into their places in the list according to the dates of their respective appointments; for it must be observed that the same warrant, the modified operation of which has enabled the lieutenant-colonels prior to the 20th June 1854 to attain to a superior rank after an unusually short period of service, also authorizes the Crown to promote lieutenant-colonels for "distinguished service," so that they cannot be allowed to complain of one provision of it when they consider that another has been strained for their benefit and to meet their just complaint.

G. Brown.

U. S. Club, 22 May 1863.

Maj.-Gen. Sir WILLIAM BRERETON, K.C.B., K.H.
Maj.-Gen. HENRY SANDHAM.
Maj.-Gen. DAVID RUSSELL, C.B.
Maj.-Gen. RANDAL RUMLEY.

LIEUT.-GEN. RIGHT HON. J. PEEL IN THE CHAIR.

Major-General the Hon. JAMES LINDSAY examined.

*Maj.-Gen. Hon. J. Lindsay.*

15 May 1863.

1. (*Chairman.*) Her Majesty having been graciously pleased to appoint this Royal Commission for the purpose of inquiring into the cases of certain aides-de-camp and other officers promoted for distinguished service in the field, we the Commissioners, believing that you, from your knowledge of the subject, and from the great attention you have paid to it, are best qualified to state the case of those officers, request you to do so?—In the first place, if you will allow me, I will lay before you a memorandum which contains a copy of two *Army Lists*. If you will look into the interior of that memorandum you will find that the extract from the *Army List* of October 1858, before the rectification took place, is on the left. It shows the position then held by the Queen's aides-de-camp and distinguished service colonels, each of whom is marked by an asterisk. It also shows the officers who had been passed over previously to those distinguished officers being promoted. The names of those officers who were so passed over are in italics. I will now pass from that to an extract from the *Army List* of April 1863. This list has the double purpose of showing those who were passed over and those who were promoted. Those in italics are those passed over by the action of the warrant of 1854, and they are put back into their places in this list. In this extract from the *Army List* of April 1863 the whole of those officers, except those promoted for distinguished service, now hold the dates of November 1854 by the rectification. The names of the 21 colonels in question are inserted; they are underlined in the places claimed, and denoted by asterisks in the places where they now stand.

2. (*Gen. Sir G. Brown.*) Why does this paper go so far back?—The purpose of that paper is to show clearly what the claims of these officers are. The object of these officers has been misconstrued and misunderstood. It has been generally thought that they were anxious to regain the places which they held previous to the warrant of 1858, whereas the argument of those officers is that it is perfectly just that every officer who had been passed over, whose name is in italics, above the names "Flude," "Tulloh," and "Teesdale," has a perfect right to be again placed over their heads. There has never been a dissentient voice upon that subject.

3. (*Maj.-Gen. Sir W. Brereton.*) Upon what principle do you draw that distinction?—I will show in due time the principle upon which that distinction is drawn. You will recollect that the Royal Commission in 1854 altered the system of promotion in the army to the rank of colonel. Periodical brevets were abolished, and the Commissioners recommended that all lieutenant-colonels on completing three years effective service in command or on the staff, should attain the rank of full colonel. But they also recommended that the existing interests of lieutenant-colonels, who got their rank of lieutenant-colonel prior to the 20th of June 1854, should be protected, and they used this language in the 52d clause on page 15 of the Commission of 1854:—"We have hitherto considered "the question before us only with reference to the "permanent system of promotion to be established. "We are, however, aware, that if this system were "at once substituted for that which has been hitherto "in force, without adopting some means to protect "the interests of those whose prospects would be "affected by the change, much injustice would be "inflicted on many officers who have relied on the "continuance of the present regulations. We are "of opinion that a liberal view ought to be taken of "the claims of these officers, and that in introducing "a change which the public good requires they "ought to be carefully protected from injury, and "from having their just expectations disappointed. "We would therefore humbly recommend to Your "Majesty that, before our suggestions are adopted, "should they meet with Your Majesty's approbation, "a general brevet should be granted; and also that "the regulation we have proposed, limiting the advancement of lieutenant-colonels to the rank of "colonel to those only who shall have served three "years in command of a regiment, or in staff situations as already described, should not apply to

*Maj.-Gen. Hon. J. Lindsay.*

15 May 1863.

" existing lieutenant-colonels or majors, including " captains and lieutenant-colonels of the guards." Then in the 53d paragraph it says, " With regard to " the manner and the numbers in which existing " field officers should, from time to time, or as vacan- " cies occur in the major-generals' list, be advanced " to the rank of colonel, we think this is a question " which may most conveniently be left for the con- " sideration of Your Majesty's servants; it is suf- " ficient that we should express an opinion that the " principle to be followed ought to be that of not " disappointing, so far as it is possible to avoid it, " the fair expectations of these officers, and of pro- " viding for their obtaining, without additional delay, " that promotion which they would have obtained " under the present system." The warrant which was founded upon this Royal Commission of 1854 contained the three years qualifying rule, but the warrant did not contain any protecting clause—such a protecting clause was entirely left out. In fact, the warrant was not worded according to the recommendation of the Commission, in the 52d clause, but from the summary in the second paragraph on page 27, which was to this effect:—" That existing field " officers be allowed to rise by brevet as under " the regulations now in force." That protection was left out, and consequently on the 28th of November 1854, every lieutenant-colonel who had completed his three years qualifying service in command of a regiment was at once promoted to the rank of full colonel, passing over the heads of other lieutenant-colonels senior to him who had not so qualified; a great many were very old soldiers, and field officers of very long standing, but the whole of their previous service went for nothing—they were superseded. I will illustrate what I am saying by the paper before you. There was an officer of the name of De Rottenberg, who was the junior officer promoted by the three years rule on the 28th of November 1854. He does not appear upon this list, because he is gone. He was promoted, passing over all those men whose names now stand in order in italics; of course upon that date there were a great many more. Upon the 1st of April 1855, Henry George Teesdale, of the artillery, was promoted by the three years rule to the rank of colonel, passing over those officers who are marked in italics. At this point I wish to draw the distinction which I alluded to just now. Major-General Brereton asked why the distinguished field officers did not claim to be above the officers in italics now above those whose names I have mentioned. But the answer is, that every one of those officers in italics had a right to have been promoted upon the 28th of November 1854, and had a right, as was proved afterwards by the Commission of 1858, not to have been passed over, or superseded at all. Therefore the principle is this, that every one of those officers in italics had a right to be above Colonel Teesdale, and consequently they had a right to be placed above every distinguished service officer promoted after Colonel Teesdale. You will recollect, also, that the Commission of 1858 was appointed for the purpose of rectifying the grievance that those very field officers suffered under. The Commission of 1858 went into the case of the superseded officers, and decided that their grievance was a substantial one, and that they ought never to have been passed over by the three-years qualifying officers, and that they ought all to be put back again into their places. With respect to the three-years men who passed over them, I will draw attention to the first page of the Report of 1858, in which a paragraph occurs which is of some importance, as showing what the Commissioners thought the object of their Commission to be. The third paragraph says:—" We have endeavoured, in accord- " ance with what we conceive to be the spirit of our " instructions, first to ascertain whether, in the " changes made on the recommendation of the Royal " Commission of 1854, the vested interests of the " officers already enjoying the ranks more immediately " affected by those changes were sufficiently guarded, " and if not, to report what measures are necessary " to neutralize the effects of any hardships so unintentionally inflicted upon them." Therefore the Commissioners of 1858 at once recognized that those superseded officers had a fair grievance, and accordingly they decided that they should be restored. The 47th paragraph says:—" It appears, therefore, to " us, after carefully weighing the amount of hardship " and inconvenience which will be undergone by " allowing the operation of the warrant on the lieu- " tenant-colonels of 1854 to remain undisturbed, or by " replacing the lieutenant-colonels passed over on the " list of colonels according to their original seniority, " there will be less hardship and inconvenience suf- " fered by adopting the latter than the former course." They agreed, therefore, by that paragraph, that the whole of those officers should be placed again above those three years qualified colonels who had passed over them, which would have neutralized the injury; and if the Commissioners had not gone further, the Queen's aides-de-camp and the distinguished service officers could have had no possible grievance. If the warrant of 1854 had carried out the recommendations of the Commissioners of 1854, the Queen's aides-de-camp or the distinguished service colonels would have been exactly in the place in which they now claim to be, and would have had no grievance whatever, because, as appears from what I read before, the Commissioners distinctly laid down the principle, that, although the three years' men were to be promoted, all lieutenant-colonels prior to June 1854 were to be protected from being passed over by those three years' men. We now come to what was done. What was done was this: the 48th clause says:—It appears, however, to us that it " would be less invidious to the promoted colonels," (not to the superseded officers, but to the promoted colonels,) " to whom every consideration is due, and " will mark more clearly the object and intention " of the proceeding, if the original error, commit- " ted in 1854, be now rectified by granting and " ante-dating an extension of the brevet given in " that year, so as to embrace all the lieutenant- " colonels who held that rank prior to June 1854." Now that is the grievance of the distinguished service colonels. The grievance that they complain of is, that a certain number of officers, who had no claim whatever by any rule, either by the old brevet system or by the new three years' rule, to be placed above them, were by that proceeding at once placed above them. And what they say is this, that no officer, who could not show a right to be a full colonel before they were promoted, has any claim to be placed before them. It is true that the warrant of 1858 had the contrary effect, but they appeal against that warrant, for reasons which I shall presently show. After Colonel Teesdale was promoted upon the 1st of April 1855, Sir Thomas Troubridge was selected by the Crown, and made a Queen's aide-de-camp, on the 18th of May 1855. On the 29th of June 1855, six other officers were made Queen's aides-de-camp, including Colonel Gordon, of the engineers, who appears separately on that list. Colonel Adams became a lieutenant-colonel on the 16th of July 1852, and he completed his three years' qualifying service on the 16th of July 1855, and was immediately promoted for that reason. I do not know whether it is worth while to follow the matter further, inasmuch as one name is as good as a dozen. The principle involved is this, that Sir Thomas Troubridge and six other officers were promoted in May and June 1855 to be Queen's aides-de-camp, and that Colonel Adams would not, even by the old brevet system, nor even by the three years' rule, have been a full colonel before the former were selected, unless he could prove that he had a right to be a full colonel, either by the old brevet system or by the new three years' rule, before those Queen's aides-de-camp were selected. You will see that Colonel Adams was only qualified by three years' service to be a full colonel, on the 16th of July 1855, after Sir Thomas

Troubridge and the six other officers had been selected by the Crown; that is the principle of the claim. I am aware that there is a distinction drawn between Queen's aides-de-camp and other officers. It is a very old standing privilege of the Crown, of almost immemorial date, to select aides-de-camp. The custom of the service formerly was not to select lieutenant-colonels, and make them colonels for distinguished service, without making them Queen's aides-de-camp.

4. (*Gen. Sir G. Brown.*) Do you know of any instance of the kind?—I do not know of any instance. I conclude that the right of the Crown was not disputed, but it certainly was not the usage. I do not come here to dispute (it will be for the Commissioners to consider that) either the Commission of 1854 or the warrant of 1854. We never say one word against that warrant, except that it did not carry out the protecting recommendation of 1854. On the contrary, I myself hold by the recommendation of that Commission and also by the warrant of 1854. By that Royal Commission, authority was given to the Crown to select for distinguished service. I do not dispute that it is right to carry out that clause if the Commission think fit to do so.

5. (*Chairman.*) Do I rightly understand you to say that the authority of the Crown to promote distinguished officers was given by the warrant of 1854?—A direct authority was given to the Crown to promote distinguished officers by the warrant of 1854, and I cannot point out undoubtedly any instance of the selection of a full colonel for distinguished service previous to that date.

6. (*Maj.-Gen. Russell.*) That authority was exercised to the prejudice of those who had been lieutenant-colonels at the time it was given, and thus interfered with vested rights?—Though I am here to give evidence in favour of all the 21 officers, there is a difference between the two classes. I may add that I think that if there had been the slightest idea that any dispute could have arisen with regard to the officers passed over and the officers promoted for distinguished service, it would have been very easy for the Commander-in-Chief and the Secretary of State for War to have advised the Crown not to promote those officers for distinguished service only, but to have made them all aides-de-camp.

7. The object was to reward a certain class of officers whom the Secretary of State and the Commander-in-Chief thought worthy of promotion?—Yes, exactly; and one set were made Queen's aides de-camp, and another set had the rank given to them without being so made. In either case the object was the same. If you look at the list below the distinguished service officers, you will find a certain number in italics, and you will also find a certain number in Roman characters. Those who are in Roman letters are officers who passed over those who are in italics. Of course the Queen's aides-de-camp and the distinguished service colonels claimed that none of those officers, either in italics or in Roman letters, had the slightest right to be placed over their heads, because they had no right whatever to be colonels before they themselves were selected. They say that all that ought to have been done was this—for instance, it was quite right to reinstate Colonel O'Connor and Colonel Darley George above Colonel Yorke, but it was not right that any one of the three should be placed above the Queen's aides-de-camp. I do not know that I have anything more to say with regard to the facts of the case; but there is one very material point which I wish to point out, and which I have not yet touched upon. The most serious case at the present moment among all these Queen's aides-de-camp and distinguished service colonels is that of Colonel Gordon of the Royal Engineers. He was serving as a lieutenant-colonel before Sebastopol on the 24th of April 1855; it pleased the Queen to promote him to the rank of full colonel on the 29th of June 1855 for distinguished merit. If he had not been deprived of his position in the list he would have been a general a year ago. He not only has lost one year, but he will, as may be fairly supposed, unless his claim is recognized, probably lose some four years more. You cannot calculate the deaths in the Royal Engineers at a higher rate than two in the course of a year and he has now got some seven or eight before him. Probably that is one of the most important cases of all. No doubt the officer promoted in his place is an older soldier by a good many years, but the position which Colonel Gordon takes up, and which I here take up for him, is that General Stehelin and Colonel Gordon were both serving as lieutenant-colonels in April 1855. The former would have been very happy indeed, I have no doubt, to have been in the trenches before Sebastopol, but he was not there, whereas Colonel Gordon was there. And the Crown, under the advice of the Commander-in-Chief and the Secretary of State for War, thought that his duties before Sebastopol were so meritoriously discharged that he was selected to be a full colonel on the 29th of June 1855, while to the misfortune of Colonel Stehelin he could not have been so selected. When Colonel Gordon was selected to be a full colonel Colonel Stehelin was only a lieutenant-colonel of the 19th of September 1853, and had no claim whatever to be a full colonel under any rule before the 19th of September 1856. There is no rule of the service that would give General Stehelin a right to be a full colonel before that date, namely the 19th of September 1856, and Colonel Gordon was selected by the Crown on the 29th of June 1855. What I say with regard to those two officers applies also to others. Colonel George has appealed. We must feel for an old soldier. Colonel George is an old soldier. I think he obtained the brevet rank of lieutenant-colonel in the 22nd regiment. But the fact remains that Sir Thomas Troubridge, whose name I use because he is the senior aide-de-camp, and Colonel George were both lieutenant-colonels in May 1855. Colonel George was not serving, and had not been in the Crimea. Sir Thomas Troubridge was selected by the Crown on the 18th of May 1855. Colonel George was not selected; he became a full colonel on the 27th of September 1856, namely, three years after he got his lieutenant-colonelcy. Consequently, I maintain that under no circumstances can Colonel George have the slightest claim to deprive a Queen's aide-de-camp, selected before he had a right to become a full colonel, of the position which that Queen's aide-de-camp holds. The same remark applies to Colonel O'Halloran, who has also appealed. But I will come to the case of another officer, whose name has been extensively used, that is, Sir Alfred Horsford; he is a very distinguished soldier. I use his name because he has been brought forward constantly. I think Colonel Brownrigg has brought his name forward. Sir Alfred Horsford's case is this: when a major, he was promoted for service in the Caffre war to the rank of lieutenant-colonel, but at Sebastopol he and Colonel Gordon were both serving as lieutenant-colonels. It pleased the Crown in June 1855 to say to Colonel Gordon, I make you my aide-de-camp, with the rank of colonel; but though I have no doubt that Sir Alfred Horsford's services before Sebastopol were very meritorious (I do not know whether he commanded the Rifles, but at any rate his services were meritorious, I have no doubt), he was not selected by the Crown; he might have deserved it, that I cannot say. It is in the power of the Commander-in-Chief to advise, and the Commander-in-Chief did not advise the selection of Sir Alfred Horsford. Colonel Gordon was made a full colonel, and Sir Alfred Horsford was not, he did not become a colonel for 2½ years after Colonel Gordon was made a full colonel by selection. Sir Alfred Horsford afterwards went out to India, where his services were very distinguished, and was already a full colonel before he was otherwise rewarded. But of course I maintain that the services of Sir Alfred Horsford, subsequent to his service in the Crimea, give him no claim to be a full colonel before Colonel Gordon, unless he can show (if he can show it), by some rule of the service or other, that he was ever entitled

*Maj.-Gen Hon. J. Lindsay.*

15 May 1863.

*Maj.-Gen. Hon. J. Lindsay.*

15 May 1863.

to be a full colonel on a date before Colonel Gordon was selected. I am afraid he cannot show that. The position in which those officers stand is undoubtedly this, that the warrant of 1858 gave them their position; but these distinguished officers, on the other hand, appeal against that warrant. And I also maintain that the Royal Commissioners of that date, namely 1858, either overlooked the case of these Queen's aides-de-camp and distinguished service colonels, or, if they did not overlook their case, I appeal on the part of the Queen's aides-de-camp against their decision. And I maintain, further, that though they were justified in making any recommendation they pleased, yet, unless either the Secretary of State understood it, or the Chairman of the Commission understood it, or the Crown was led to understand it, you had no right to deprive those officers of what the Crown has given them, unless the officers who deprive them of it could show that they had claims to be full colonels before any of those officers were selected by the Crown. That is the principle upon which I argue; but I will mention another officer, Colonel Brownrigg, whose case is a very hard one. He has appealed twice against any alteration being made; but we must deal with the case thus: the Crown selected Colonel Brownrigg for distinguished service in November 1855. The consequence of his not having been selected earlier was, that certain staff and other officers serving in the Crimea, who were junior lieutenant-colonels to him, were placed over his head by being promoted in May, June, and July, 1855. That, he says, is a great mortification to him; but I am sorry to say, sitting here as a witness, I cannot acknowledge the claim of Colonel Brownrigg, because he was rewarded for service in November, to be placed above officers selected for service in May.

8. (*Gen. Sir G. Brown.*) I suppose he was made a colonel when he was not qualified by length of service?—No; I use Colonel Brownrigg's own words, he says, because "I am in the position of being a guards-"man." Of course I would rather that Colonel Brownrigg's words were used than mine. Colonel Brownrigg of course will prove his own words, and Colonel Brownrigg states, and states in print, that he was recommended for promotion upon the distinguished service list in July 1855, and that he was refused promotion because he was a guardsman. I must mention names, because it is a part of my case. Colonel Brownrigg says, "The next officers promoted "were eight, who were made Queen's aides-de-camp "on the 29th of June 1855, and then on the 17th of "the following month six more were promoted 'for "'distinguished service.' Amongst these last I was "recommended for promotion by the Commander-in-"Chief of the army in the field; but I was arbitrarily "excluded from the list for no other reason alleged, "than 'that I was a guardsman;' my services for 10 "years in the line, five of them as adjutant in the "Mauritius and East Indies, being thus completely "ignored." I think it is fair for me, when appealing against Colonel Brownrigg, to state what he says, though it is not for me to pass an opinion here upon what the Crown chose to do. I am only concerned with what the Crown did when the Crown promoted him in November, and did not promote him in May or June, consequently I say that Colonel Brownrigg, who was promoted in November, could have no claim to go over Colonel Gordon, who was promoted in June. Then Colonel O'Halloran has made an appeal more upon service than upon anything else. Colonel O'Halloran is a very old soldier, and he says: "Some of these officers, being much "younger men than I, were placed over my head. I was "ready to serve in all parts of the world." He appeals against it. The argument, I think, is the same there, that length of service has nothing to do with the selection of a colonel for a Queen's aide-de-camp. If Colonel O'Halloran had seen double the service, and it had pleased the Queen to promote Colonel Gordon, or any other officer, for service in the field, Colonel O'Halloran not being so selected, I do not think that the length of service of Colonel O'Halloran has anything to do with the question. But, as a collateral part of the question, I may mention this, that, as far as the guards and the line are concerned, the actual state of the case is, that the average length of the service of the officers promoted for distinguished service in the field is absolutely longer than that of other officers concerned. But I do not think myself that that has anything to do with the case. We might compare the service of Colonel Norcott of the Rifle Brigade with that of Colonel Carey; the former has had nearly 40 years' service, and Colonel Carey 17 or 18. By the transposition of 1858 Colonel Carey is the senior colonel, having got his lieut.-colonelcy prior to June 1854, and Colonel Norcott is deprived of his position of having been selected before Colonel Carey became a full colonel. I think it desirable that you should know the effect of the claims of the Queen's aides-de-camp and distinguished service colonels. The effect of their claim is this: the greatest number of steps that any officer would suffer by the claims of the distinguished service officers being admitted, would be eleven in the progress towards the rank of general; it varies—from eleven to five. The greatest amount of suffering, therefore, that any officer would undergo by the admission of the claims of the distinguished service officers would be eleven, whereas there is far greater suffering in the case of the Queen's aides-de-camp. In the case, for instance, of Sir Thomas Troubridge, he at the present moment is a loser to the amount of 41 steps in the progress to the rank of general, Colonel Norcott 38, Colonel Lysons 36, Lord Longford 35, and others in various degrees,—that is the amount of suffering. At the same time the greatest suffering of all at this moment is that of Colonel Gordon, who has lost a year already, and is likely to lose four more. Colonel Chapman also, who was very distinguished in the trenches, would have been a general last month if he had not been deprived by the warrant of 1858 of the position which was given to him by the Crown. Therefore the principle laid down in this claim is this, that it was quite just and right, in the opinion of those officers, that every officer that Colonel Teesdale passed over upon the 1st of April 1855, appearing upon this list in italics, had a perfect right to be replaced above Colonel Teesdale, and consequently above Sir Thomas Troubridge and the rest. Against that they do not appeal, they think it just, and say nothing against it, but they claim that not one of those officers, who could not prove any right to be a full colonel under the old brevet system, or under the new three years' rule, before these officers were selected by the crown, has any right to be placed above them. I may say this, that, supposing the old brevet system had continued in force, and 185 officers being promoted to the rank of full colonel upon the 20th of June 1854, in the common custom there would have been no brevet again for three, or four, or five years, consequently if there had been a war Sir Thomas Troubridge and the rest would have been selected in May and June 1855, and have stood very considerably higher than the position which they now claim. They would have been above General Hill, and they would have been generals a year ago. If it had pleased the Crown, in consequence of there being a war, to have given, as they did in the old time, a brevet every year, and supposing upon the 1st of May 1855 there had been a war going on, and the Crown had given another brevet, and had promoted 200 lieutenant-colonels at once to the rank of colonel, Sir Thomas Troubridge and the rest would have stood exactly in the places which they now claim, even after that promotion. Therefore, under either system, the claims of these officers are alike supported—Sir Thomas Troubridge stands as the senior next to Colonel Teesdale.

9. (*Chairman.*) Previously to the year 1854 was not the promotion from the rank of lieutenant-colonel to that of colonel governed entirely by seniority, subject only to the appointment, by the Sovereign, of aides-de-camp carrying the rank of colonel?—Yes.

10. Had not every officer obtaining the rank of lieutenant-colonel, either by purchase or by the regular course of promotion, a right to expect that no other officer should be placed over his head except in the case I have mentioned?—Yes.

11. If in 1854 all the officers then lieutenant-colonels had been promoted at once to the rank of colonel, that would have preserved them in their relative positions with regard to one another, would it not?—Certainly.

12. Their promotion would have inflicted an injury upon no one at that period, would it?—Certainly not, at that period.

13. Although it would have been an unprecedented thing to make so large a brevet at once, there was no rule of the service which would have prevented its being carried out, because there was no fixed period of service for a lieutenant colonel before he became a colonel?—No.

14. But, as you have stated, that was not done in 1854?—It was not.

15. And you have stated that the interests of those officers were not protected by the warrant which, as you have pointed out, did not bear out the recommendations of the Royal Commission?—Yes, exactly.

16. Your ground is this, that, although those officers, if they had been promoted in 1854, would have inflicted no grievance upon anybody, yet, as they were not so promoted in 1854, have no right to claim more than a protection from the effects of the warrant upon them. I wish to elicit your views?—That is the case; these superseded officers merely claimed a protection against the three years' officers.

16*a*. And you state that it is perfectly admitted, even by those Queen's aides-de-camp and those very distinguished officers, that they have a very fair right to be protected against the operation of the warrant which would place officers of three years' service over their heads?—Yes.

17. Therefore it was necessary that when any officer had performed three years' service, all those senior to him should be made colonels?—Exactly.

18. And that, therefore, when any officer who was not a lieutenant-colonel in 1854 had, by three years' service, entitled himself to become a colonel, the whole, including the juniors, must have been promoted?—No; because the whole of the system turns upon the words "who were, prior to June 1854."

19. To put the question in another form, supposing an officer got a lieutenant-colonelcy immediately after the 20th of June, as soon as he had served three years he would be entitled to become a colonel, but he would go over the heads of those other officers unless you promoted them all?—The words "protection of "existing interests" only alluded to those who were lieutenant-colonels prior to the 20th of June 1854.

20. Did not it extend to the whole of them, even to the juniors of 1854?—Yes, the protection extended to the whole of the lieutenant-colonels prior to June 1854 against the three years' class.

21. Therefore, as soon as an officer who was not a lieutenant-colonel at that time, afterwards by service becomes entitled to the rank of colonel, in order to protect their interests the whole of the lieutenant-colonels of 1854 must be promoted to the rank of colonel, or else a junior officer would be placed over their heads; for instance, if on the 21st of June the major becomes a lieutenant-colonel?—Yes.

22. After serving three years, that man who was formerly a lieutenant-colonel is entitled to become a colonel; therefore, in order to protect the other officers against him, you must make them all colonels?—Yes, and that was done by all the lieutenant-colonels prior to June 1854 being replaced in former rotation above the three years' class.

23. You admit then that it would have been necessary the instant that one man acquired the right to a colonelcy under the new warrant, to protect the others by promoting them?—Yes; a man promoted to lieutenant-colonel on the 19th June 1854 would have a claim to protection, but anyone promoted to lieutenant-colonel on 21st June would have none.

24. I think one of the complaints, as stated by one of those distinguished officers who was examined before that committee—Colonel the Hon. Percy Herbert—(at page 13) was this, that "what they were "justly entitled to was protection from injury by this "new rule; they never complained (or if they did their "complaint was not on tenable grounds) that officers "had been promoted over them for distinguished "service, because that was an old practice before they "entered the service. Protection from injury by the "new rule was therefore what they were entitled "to"?—Yes.

25. That is the ground, I apprehend, which these distinguished officers take?—Certainly.

26. But you yourself say, that the authority to appoint officers as colonels for distinguished service, was given by the warrant of 1854?—The authority was given by the warrant of 1854.

27. Therefore any officer appointed under the warrant of 1854, as a colonel for distinguished service, and placed over the heads of those men who were lieutenant-colonels before that time, would be interfering with their vested interests, would he not?—That undoubtedly is a case which it is for the Commission to consider. Unquestionably it does interfere with those officers, but I may put the case thus, that the officers whose appeals are in the papers before you have made a complaint lately with regard to those distinguished officers, as different from the Queen's aides-de-camp, being placed above them, but it is a new ground which they have taken, and I believe it has been taken only by Colonel Brownrigg, to the best of my recollection.

28. I do not wish to allude to individual cases. I examine merely as to the principle. I think it is laid down in a letter from the Treasury "that long established "usage had recognized the privilege of promotion for "officers obtaining the appointment of Queen's aides-"de-camp in recognition of distinguished service in "the field"?—Yes.

29. In fact I believe there can be no doubt about it that it is in the power of the Crown to have an unlimited number of unpaid aides-de-camp, that appointment giving the rank of colonel, but that power was not exercised in this case. Would it not have been necessary, in order to protect the officers who were lieutenant-colonels previously to 1854, the instant the first officer was appointed a colonel for distinguished service to have made all the lieutenant-colonels of 1854 colonels?—I hold not, certainly, because the object of the Commission of 1854 in the protection of existing interests must be taken by the context; the context was the three years' rule, and the protection of existing interests was solely against that rule; it did not at all allude to the protection of existing interests against any other rule, but the context being the three years rule, the result is a protection against the three years rule, and not against any distinguished service rule.

30. Do not you think that it is of great importance that no prospective alteration should affect the rights and interests of those who have obtained that rank?—I cannot say that I do in a case of that sort. Supposing that the Queen had brought out a warrant quite independently of this new three years system, simply establishing a new rule giving you the authority to promote for distinguished service, I do not think that there would have been one feeling in the army from first to last against it. Such a thing had never been done, but a warrant of that sort might have been brought out, I think.

31. Do you not think it a great disadvantage that there should be an uncertainty as to the position of officers in their respective and relative positions arising from their being liable at sometime to be passed over by another officer? In fact, everybody must admit the great inconvenience which has arisen from the warrants of 1854 and 1858?—I agree entirely in the principle which you have laid down, but

*Maj.-Gen. Hon. J. Lindsay.*

May 1863.

not as applied to this particular case: because, although the distinguished service may be a new rule, yet the same principle existed with reference to the Queen's aides-de-camp. The Crown says to one man, "I make you my aide-de-camp," and to another man, "I promote you for distinguished service."

32. It would not affect those who were aides-de-camp previously to the appointment of the first officers for distinguished service. Who were the first officers that were promoted? I believe Sir Thomas Troubridge was the first, and he was promoted in May 1855?—Yes.

33. Then there were a batch of officers promoted as Queen's aides-de-camp?—Yes.

34. According to your principle, supposing that the warrant of 1858 had not given their position at once to all the lieutenant-colonels, if the rule had been established that they were to wait till they had performed three years' service, those officers who were promoted then would have come into a position junior to the men who had been promoted for the three years' service, they would have come in where they claimed to be?—Yes.

35. Then the instant that the first man was promoted for distinguished service, in order to prevent his going over the heads of the others, it would have been necessary to promote those other officers to the rank of colonels; therefore, the date of their colonelcy would have been the date of the promotion next before the promotion of the officer for distinguished service?—I hold that if they had been selected for distinguished service it would have been different, because, in the case of an officer being selected for distinguished service, the others have no vested interests to be protected against him. I hold that the vested interests which were to be protected were simply and solely as against the three years' rule.

36. What would make the difference between the interests to be protected against the three years' service and against the distinguished service, except the opinion of the Commissioners?—The opinion of the Commissioners and the warrant of 1854.

37. The warrant of 1854 did not protect them against either?—No, the Warrant of 1854 gave them no protection, but it gave authority to promote for distinguished service.

38. Then it is merely upon the opinion of the Commissioners of 1854 that the distinction is raised between the promotion for distinguished service and for three years' service?—Certainly; it was by their opinion and their recommendation that the clause was inserted.

39. It does not appear that the recommendation was attended to in either case, but you state that such a recommendation is contained in the Report, that they should be protected against the one, but not that they should be protected against the other?—That is the case certainly. The protection in the Report is against the three years' rule.

40. (*Gen. Sir G. Brown.*) Am I not right in considering that, had all those lieutenant-colonels, prior to June 1854 been promoted at once when the warrant was issued in that year, there would have been no ground of complaint?—Certainly that is so.

41. If the measure that was subsequently carried out in 1858 had been carried out before, there would have been no ground of complaint?—No, because they would have been all breveted in 1854, and the effect of that would have been that the distinguished service officers would have been where they now are.

42. If, in carrying out the retrospective measure of 1858, they had given to all those lieutenant-colonels, without reference to the commanders, the rank of colonel when they had completed the three years, would there still have been any ground of complaint?—That is exactly what I think ought to have been done, and the effect of it would have been that Sir Thomas Troubridge and the distinguished service officers would have been exactly where they now claim to be.

43. Am I right in considering that all this difficulty has arisen from an administrative mistake and oversight?—That is my opinion.

44. If all those officers had been promoted at the end of their three years' service as lieutenant-colonels there would have been no complaint at all?—No, and the distinguished-service officers would be where they now claim.

44*a*. (*Maj.-Gen. Sir W. Brereton.*) On the part of those officers who had not commanded battalions for three years, but who by the rectification brevêt of 1858 were all made colonels, was there under the rules and conditions of the service when they entered it, or in the early part of 1854 before the warrant was made, any bar to their becoming full colonels, if circumstances had arisen to bring that about?—There was no bar; no, they would have risen by merit in their turn, and I cannot point to any instance of a lieutenant-colonel being selected for the rank of full colonel, except in the case of a Queen's aide-de-camp.

45. They were within the reach of the brevêt, if the old rule of brevêts had not been abrogated, is not that so?—Yes, but though the usage might have been against the selection, yet the prerogative of the Crown would have enabled it to be done.

46. It would have been possible to have given a brevêt to any extent?—Yes, no doubt.

47. Will those officers who claim to consider themselves injured, and whom you represent, be content to consider as final the decision of this Commission, whatever that decision may be?—I think you had better ask Sir Thomas Troubridge that question.

48. (*Chairman.*) You state, either in the letter addressed to the Secretary of State for War, or in your report, that you proposed three distinct methods of meeting the grievance of which these officers complain. Would each of those methods have had a similar effect in placing all the officers exactly in a similar position?—It would.

49. The means of rewarding or promoting distinguished officers is not confined to their relative positions in their rank as colonels?—No; in their rank as lieutenant-colonels.

50. Whatever their position may be in the list of colonels it is of course in the option of the Crown or of the Commander-in-Chief to select them?—I presume you mean as lieutenant-colonels.

51. As colonels or major-generals, are there opportunities afterwards of selecting them in preference to even those who are their seniors?—Certainly, it is the privilege of the Crown to select for whatever purpose it is thought right.

52. Therefore those means are still open to the Crown of remedying the grievance of which the distinguished officers have complained?—It is open to the Crown to appoint them. The three proposals which I made to Lord Herbert were, first, that each of the officers should be put back into the place he claimed, and ante-dated on the 28th of November 1854, that was thought the easiest way of getting over the difficulty; but there were some officers who on the 28th of November 1854 had not attained the rank of lieutenant-colonel.

53. And some of them were not majors?—Yes.

54. That rendered it necessary only to ante-date the rank of lieutenant-colonel one day before the rank of colonel?—Yes. Lord Herbert adopted that suggestion, and proposed it. The second proposal I made was to leave them in their present position, and select them out of their present position for the rank of general in the order which they now claim.

55. (*Maj.-Gen. Sandham.*) It was that they should be all major-generals?—They would all become major-generals exactly in the rotation in which they now claim to stand as colonels. The third proposal was then considered to be the best, it was, that they should remain in their present position in the list of colonels until such time as they would become generals in the places they claimed, and that they should then be promoted to be supernumerary generals so that the officer who would then have stood at the head of the list of

colonels, namely Colonel Adams, would not have been kept back by the promotion of the distinguished-service officers. You then would have absorbed in the general establishment the distinguished-service officers in the place in which they at present stand.

56. (*Gen. Sir G. Brown.*) That would have involved the expenditure of a considerable sum of money, would it not?—It would involve an expenditure of money. That was the proposal which Sir George Lewis adopted, and the Treasury declined it, saying that the second proposal which I have mentioned would meet the object.

57. But it also involved the complaint which the senior colonels made on the point of seniority; if one of those major-generals had been called into the service he would have been senior to them?—Yes.

58. Therefore, it would not have met their objection?—No.

59. Would your three proposals have placed all the officers in the same relative position, not only those promoted by distinguished service but the other officers also?—Most undoubtedly; my proposal, which ever way it might have been taken, would have had the effect of placing the distinguished-service colonels in the position which they now claim when they became generals. I claim for Sir Thomas Troubridge that he should be senior to Colonel Adams, whether as colonel or as a general—and so he would have been. One of the arguments which have been used against the claims of the distinguished service colonels has been based on the assumption that the Commission of 1858 did what the Commission of 1854 ought to have done. Now, in what the Commission of 1858 did, you will find no allusion to what the Commission of 1854 ought to have done. That argument against these claims means that the Commission of 1854 ought to have promoted all those officers in 1854; but the wording of the Commission of 1854 is extremely clear, it recommends the Queen to give a brevet by way of inaugurating and starting the new system.

*Maj.-Gen. Hon. J. Lindsay.*
15 May 1868.

60. (*Maj.-Gen. Rumley.*) I think there was not any limitation to the brevet recommended?—Yes, a general brevet was recommended, but it was not recommended that the whole of the existing lieutenant-colonels should be promoted; but the argument used is, "It is of course to be assumed that what was then "done (in 1858) should have been done in 1854."

61. When they recommended a brevet, there was limitation in 1854?—None; it was a very large brevet, one of the largest ever given, it took in the whole of the colonels of 1848.

The witness withdrew.

Colonel Sir THOMAS ST. V. H. C. TROUBRIDGE, Bart., C.B., A.D.C., half-pay 22 F., (*Deputy-Adjutant-General*), examined.

*Sir T. St. V. H. C. Troubridge, Bart.*

62. (*Chairman.*) Have you anything to add to the statement which has been made by Colonel Lindsay on behalf of the distinguished officers and aides-de-camp?—My own case would perhaps be more clearly put by supposing that the whole of the lieutenant-colonels in the army had been on parade when I was promoted, in which case, those who were then below me from Colonel Tyrwhitt down to Colonel Irwin, might fairly have said, we claim to be now on the colonels' list, in which case Sir Thomas Troubridge would be below us. I should have most willingly admitted their claim, because they had been passed over under the three years' rule, and might fairly have expected on that date to have been already colonels; but by the antedated brevet, not only those are placed above me, but more than 40 other colonels who, if they had been on parade in May 1855, could not have established any such claim.

63. You allude first of all to those whom you say would have been seniors to you, arising from the circumstance of their having served three years?—Yes, from having served three years on that date, whether on qualifying service or not, they might therefore fairly say, promote us on the day on which we complete three years' service, otherwise we are in danger of being passed over by some junior officer. I think Major-General Lindsay has not, perhaps, quite sufficiently dwelt on the point of our present position being the result of an oversight in the preparation of the warrant of 1854, because we should have been placed in exactly the positions we now claim had the warrant of 1854 had the protecting clause inserted in it which was recommended by the Commissioners of 1854 against the three years' service rule. The 8th clause of the warrant was taken apparently from the summary of the report of 1854, and not from the body of the report; the summary gave simply a recapitulation, and the detail was in paragraph 52 in the body of the report. That paragraph strongly insisted on protection to existing interests. Had that protection been given we should have been exactly in the places we now claim, because each officer would have been promoted on attaining the qualification of three years' service. Colonel Teesdale on the 1st April 1855 completed his three years' service, and I should have followed next, having been appointed aide-de-camp to the Queen in May 1855.

64. (*Mr. Bouverie.*) Have you any grounds for supposing that the Commissioners drew a distinction in the protection they recommended, between the protection against the three years' rule, and the protection against the distinguished service promotion, which they also recommended to be introduced?—I think for my own part that the two cases are in a precisely similar category, and that the protection was not thought of as regards the distinguished service colonels, and therefore no protection was given.

65. In neither case protection was given?—It was omitted in the warrant by an oversight.

66. (*Chairman.*) You think the cases were exactly similar?—Yes, and that when a distinguished-service officer was promoted, those over whom he went might fairly claim the same protection as from the three years' rule. Had this been foreseen it would have been provided for, but the special promotion given to the 10 colonels in question cannot in justice be cancelled three years afterwards on account of an official oversight. The cases of the supernumerary major-generals are similar, and on the same principle these colonels may say, if you have promoted in such a way as to injure the vested rights of other officers, then make us supernumerary major-generals when the places we claim come to the top of the list.

67. You admit that there is a distinction between the distinguished-service officers and the Queen's aides-de-camp?—Yes, a decided distinction, the one having been promoted under the new rule of 1854 and the other under a very old and well-established and well-known rule, to which no exception has been taken, at least as old as the reign of George the 1st; but you cannot in justice cancel the special promotion given in either case.

68. If that was carried into effect, and a distinction between the distinguished-service officers and aides-de-camp adopted, there would only be seven officers with whom to deal, would there?—There would be 11 officers.

69. Are the 11 officers senior to Colonel Borton?—Only five of them.

70. If, when Colonel Borton had been promoted, he had carried up all above him, there would have been only five?—Yes, if it had been foreseen at the time that the special promotions under the 13th clause of the warrant of 1854 would have affected

*Sir St. V. H. C. Troubridge, Bart.*

5 May 1863.

the interests of the lieutenant-colonels of dates prior to 20th June 1854, it is probable that Colonel Borton and the other 10 would have been promoted as Queen's aides-de-camp. I think those officers may fairly say, it is not just to put us back because we were promoted under an oversight. It can be shown that there was an oversight in the preparation of the warrant of 1854, in not carrying out the protection in the warrant which was recommended in the Commissioners' Report. Had that protection been given we should have been in a very different position. The oversight of 1858 also occurred because the error of 1854 was not clearly ascertained. I am anxious to show that the Commissioners of 1858 did not clearly see the nature of the oversight of 1854. In paragraph 34 they say they think it a matter of regret that the whole of the lieutenant-colonels prior to the 20th of June 1854 were not immediately promoted. Now the report of 1854 is dated on the 17th of June, and had it been proposed then to promote Colonel White, who was only a lieutenant-colonel on the 1st of June, it would have naturally been said, Why should you promote him now ? He is in no danger of being passed over until the 1st of June 1857, because no lieutenant-colonel junior to him can possibly be qualified for the rank of colonel for the next three years.

71. Might it not have been in order to prevent the possibility of his being passed over by an officer appointed for distinguished service ?—There is nothing in the report of 1854 to show that the Commissioners ever contemplated anything of the sort.

72. I think you stated that you yourself thought it was an oversight ?—The oversight was in the establishment of a new rule of promotion without providing for the protection of existing interests as was done in the case of the supernumerary generals. In 1854 was established a new rule of selection from the rank of colonel, and the existing colonels were partially protected, but the Commissioners of 1858 came to the conclusion that the seniors had not been sufficiently protected, and they established the present system of making every general promoted by selection supernumerary.

73. I suppose you admit that if in 1854 they had all been made colonels, although there might have been some inconvenience, neither you nor any other officer would have had the slightest ground of complaint ?—Not the slightest ; we should all have been placed on the colonels' list in its then state, and taken our place at the bottom where we were then put. I should then have been in the place where I am now, below Colonel White ; then another point that I am anxious to state is that there is nothing either in General Lindsay's oral evidence which has been alluded to, or in the report of 1858, to show that the case of the Queen's aides-de-camp was ever taken into consideration in any way. The words " Queen's " aides-de-camp " do not occur, either in the evidence or in the report. It appears to me that had the effect of the antedated brevet on the Queen's aides-de-camp and on the officers promoted for distinguished service been clearly foreseen, it is impossible to conceive that the Royal Commission would not have made some allusion to it. In General Lindsay's evidence allusion is made to the distinguished-service colonels. It is evident that the nature of the injury which would be done, unless their interests were protected in the revision of the list, was not clearly seen, and the president and three of the military members of that Commission have distinctly and repeatedly declared that they did not in any way take into consideration the injury that would be inflicted upon those officers by the antedated brevet. Therefore I think on those grounds that we have a fair claim to ask for a re-consideration, because there is not anything on the face of any of the proceedings to show that the injury which has been done to us was foreseen, and was the result of deliberate action on the part either of the Commissioners or the Crown. It has been stated that this case has been fully investigated and finally settled, but it does not appear that such is actually the case, as the proceedings of Sir Charles Yorke's Committee, so far from having been confirmed at any time, were followed by a recommendation, from the late Secretary of State, to the Treasury for the sum of 11,000*l.* to enable the officers in question to be promoted in their proper turns as supernumerary major-generals, which is certainly the very reverse of confirming the recommendation of Sir Charles Yorke's Committee.

74. Do you not consider that this question ought to be decided upon principle, without reference to any individuals ?—Yes, and I think our claims should be decided on a reference to what was due to us in 1855, without reference to any subsequent services. It will appear that the Commissioners sitting in 1858 did not sufficiently consider the state of the list in 1855 ; they recommended a wholesale antedated brevet, without sufficiently considering the interests that had sprung up in the interim under different rules, viz., the special promotions.

75. (*Maj.-Gen. Rumley.*) I think you stated that you considered that there had been an error, on the part of the Commission of 1854, in not recognizing the claims of those officers who might be promoted for distinguished conduct ?—I think, had they foreseen that a war might arise, and that officers of distinguished conduct might be promoted to the injury of the vested rights of the lieutenant-colonels then existing, they would equally have recommended that protection should be given, under the warrant, from those officers as they did from the three years' class.

76. To what class of officers do you consider that that protection referred ?—I think they had only under their consideration the operation of the three years' rule. Paragraphs 52 and 53 would tend to show that they said " We are now introducing a " new system of promotion, but let us protect the ex- " isting interests." They did not lay down exactly how they would give that protection.

77. (*Chairman.*) Would they not equally have said, with regard to the promotion of distinguished officers, that they ought to be guarded against that promotion also ?—In paragraph 52 the report speaks of the introduction of the new three years' clause ; had the retrospective effect of the new rule of promotion for distinguished service been foreseen, some allusion to it would probably have here been made, and it would probably have been recommended that the old system of promotion to colonel by appointment as Queen's aide-de-camp should be adhered to until June 1857, at which date, according to the spirit of their recommendation, Lieutenant-Colonel White the junior lieutenant-colonel in June 1854 would receive promotion.

78. Do you consider that the protection was intended for those officers who had not completed their three years' service in command, and not for others ?—It was for those who were on half-pay and otherwise not qualified. The Commissioners said those officers had their vested rights and must be protected. In paragraph 53 the Commissioners leave it rather an open question how it is to be done, but the principle is well established.

79. Do you not consider that they intended that protection should be given to all those who held the rank of lieutenant-colonel at that time ?—Yes, a full protection against the three years' rule.

80. (*Maj.-Gen. Rumley.*) It was not limited ?—No, it was not limited. I think they did not foresee what might arise as regards promotion under the 13th clause for distinguished service.

81. (*Maj.-Gen. Sir W. Brereton.*) Has it not been a constant practice in all warrants to give protection to any officers who were considered to have a claim under previous warrants ?—Yes, but in the warrant of October 1854 the protection was only omitted by

an oversight; had it been given as recommended no revision of the list would have been necessary in 1858, and we should have occupied the positions we now claim as aides-de-camp, and the 10 colonels promoted under the 13th clause would either have been promoted as aides-de-camp, or would be entitled to be treated in the same way as the seven supernumerary major-generals mentioned in Appendix 1 in the papers printed for the House of Commons.

*Sir T. St. V. H. C. Troubridge, Bart.*

15 May 1863.

The witness withdrew.

Colonel JOHN WILLIAM GORDON, C.B., A.D.C., R. Eng., examined.

*Col. J. W. Gordon.*

82. (*Chairman.*) You are one of the 21 officers whose cases are before us, are you not?—Yes. And I come before the Commissioners merely to state that I lay claim to the position of major-general of the 3d of April 1862, as set forth in the table submitted by Sir Thos. Troubridge showing the positions now held, and those claimed by the 21 officers in question. The grounds on which I make the claim have, I presume, been so fully stated, by Major-General Lindsay and Sir Thos. Troubridge, that it is not necessary for me to go into them. I have been frequently mentioned as having received great rewards for my services. I admit that the rewards were greater than what was due to my merits. I wish, however, to explain that my rapid promotion was owing to the invaliding of Colonels Vicars and Victor before the army proceeded to Russia, and the deaths of Brigadier-General Tylden and Colonel Alexander soon after the invasion of the Crimea. Hence I became commanding Royal engineer (under the directions of Sir John Burgoyne), for a considerable period, and in consequence I received, in addition to my share of rewards, other rewards also which would have fallen to the lot of one or other of the previous commanding engineers had they lived. To what is commonly called good fortune, therefore, I am indebted for my rapid promotion, and I believe it is not customary to take from an officer the rewards he has received in tha way.

The witness withdrew.

Major-General Sir EDWARD LUGARD, K.C.B., examined.

*Maj.-Gen. Sir E. Lugard.*

83. (*Chairman.*) Previously to 1854 the promotion from the rank of lieutenant-colonel to colonel was strictly by seniority, with the exception of the practice of officers being appointed aides-de-camp by the Sovereign, and with the exception of the different ranks in the Foot and Life Guards and Ordnance Corps which carried with them the rank of colonel?—Quite so.

84. Was it the practice to give the rank of colonel for distinguished service in the field?—No, certainly not.

85. Do you not consider that there is a distinction, then, between the cases of officers who were appointed colonels as aides-de-camp to Her Majesty and those officers who were appointed under the Warrant of 1854 for distinguished service in the field?—Yes, certainly; I have always considered so.

86. (*Mr. Bouverie.*) You have no doubt about the rule with respect to there being no such promotion for distinguished service before the warrant of 1854, have you?—I never heard of a single case of such a promotion to the rank of colonel.

87. (*Chairman.*) During the whole course of the Peninsular War, was there ever such a case?—No; the system was established by that warrant.

88. (*Gen. Sir George Brown.*) The Queen's aides-de-camp were made irrespectively of service in the field altogether?—Entirely.

The witness withdrew.

Adjourned.

## At the War Office, Pall Mall, Saturday, 16th May 1863.

PRESENT:

| | |
|---|---|
| Lieut.-Gen. Right Hon. J. PEEL. | Lieut.-Gen. Right Hon. the EARL OF ROSSLYN. |
| Right Hon. E. P. BOUVERIE. | Major-Gen. GCB Sir WILLIAM BERETON, K.C.B., K.H. |
| Gen. GCB Sir ALEXANDER WOODFORD, G.C.B., G.C.M.G. | Major-Gen. DAVID RUSSELL, C.B. |
| Gen. Right Hon. Sir GEORGE BROWN, G.C.B., K.H. | Major-Gen. RANDAL RUMLEY. |

LIEUT.-GEN. RIGHT HON. J. PEEL IN THE CHAIR.

Colonel the Hon. PERCY E. HERBERT, C.B., A.D.C., Half-Pay 82 F. (*Deputy Quartermaster-General*), examined.

*Col. the Hon. P. E. Herbert.*

16 May 1863.

89. (*Chairman.*) Will you have the goodness to state to the Commission anything which you think bears upon the subject now under discussion?—In June 1855 I was selected as one of Her Majesty's aides-de-camp, and promoted to the rank of colonel, for services in the field. In 1858, after the sitting of the Royal Commission in that year, a warrant was issued by which there was a change made in the lists, and I found myself deprived entirely of the promotion which I received in the Crimea, and reverted to the same place in the *Army List* as I had occupied previously to the commencement of the Russian war. I beg to draw the attention of the Commission to the fact that promotion to the rank of colonel by selecting officers as aides-de-camp to the Sovereign is an old-established custom, and existed prior to the entry into the service of any officer concerned in the action of those warrants; and that the number of officers to be so selected by Her Majesty is not restricted by any limit. A new rule was laid down for promotion from the rank of lieutenant-colonel to that of colonel, in 1854, whereby lieutenant-colonels in command of battalions obtained the rank in three years, whereas brevet lieutenant-colonels, or those on half-pay, did not obtain it. This was complained of as a grievance, and I believe I am right in stating that the Commission of 1858 was assembled with a view of re-considering the new rules which had been laid down in 1854. In redressing the grievance which it was admitted had arisen, the warrant which was based upon recommendations of that Commission was framed in such a way as to deprive me of my promotion.

*Col. the Hon. P. E. Herbert.*

16 May 1863.

90. (*Gen. Sir G. Brown.*) You mean that it deprived you of your position on the list, do you not?—It deprived me of my promotion. As regards getting the rank of general, I was as far off as ever; in fact, it deprived me of the whole advantage of my position. I wish also to point out to the present Commission that justice might have been done to the officers who complained without so much injury to me. I believe I may state this, that the only grievance was that lieutenant-colonels, who had that rank prior to the existence of the new rule, found that they could be passed over by their juniors under that new rule. Inasmuch as no officer amongst them could be affected by the rule until he had completed three years' service, it appears to me that all that was requisite was, to put all existing lieutenant-colonels upon the same footing and to promote each as he completed his three years' service. I submit to the consideration of the Commission that that would have protected them absolutely and entirely from any injury under the warrant of 1854, and that as regarded the promotion which I enjoyed in being appointed Her Majesty's aide-de-camp, they had no grievance at all. I submit further, that the complaints that appear in the papers, which are laid before the Commission, and which have been laid before Parliament on the part of certain officers, stating that we have been placed over their heads, are directed against any promotion by selection for service in the field. One officer states that he has been so many years in the service, and was serving in the West Indies at the time. Another, that he was serving in the Crimea, but that he was not recommended by the Commander-in-chief, and not selected by the Queen for promotion. Those are not grievances that I imagine the Commission would be prepared to entertain as being just grievances against the promotion of an officer who is selected in the usual way for service. I will refer to an extract from the *Army List* of October 1858 and November 1858, before and after the warrant came out in that year. I take the number that I hold in the list from a certain fixed point, namely, Colonel Galloway. The paper (No. 1) which I produce is an extract from the *Army List* of 1858. The paper (No. 2) in the hands of the Commission is an extract from the *Army List* of 1863, and on referring to this I stand No. 60 on the list from Colonel Galloway, in the month of October. In the next month, the month of November, I stand 146th on the list from Colonel Galloway, that is to say, 86 places lower down than I was before. Therefore, I lost 86 places in the *Army List* from October to November 1858.

Appendix, page 51. Appendix, page 52.

91. (*Mr. Bouverie.*) In this memorandum (No. 2) the list is corrected to the present date?—Yes.

92. The other is the list as it stood at the time the change had been made, showing the numbers that had gone off in the interim, is not that the case?—Yes, showing those who had died, sold out, or retired on full pay. I do not know whether I have made myself quite clear to the Commission upon the proposal which I say would do justice to the officers who complained in 1858.

93. (*Chairman.*) Do you agree with the suggestion made by General Lindsay?—My suggestion is exactly the same as General Lindsay's. I would only refer to his statement in the printed papers.

94. (*Mr. Bouverie.*) You assume that all the officers who were put up in 1858 should stand in their places as if they had the claim of three years' service?—Yes.

95. (*Chairman.*) As soon as they had completed three years' service they should be promoted?—Yes. I say that gave them entire protection from the new rules, and that from all the old rules they could have no claim whatever in justice. It has been urged that the Royal Commission of 1854 meant to do what was done in 1858; but it is obvious that they shrank from making a whole batch of lieutenant-colonels (300 at a time) all full colonels, and that they gave a large brevet by way of clearing off the list, and leaving a small list to deal with exceptionally. We have reason to believe that the Commission of 1858 overlooked the bearings of the case as regards us, and in fact Lord Herbert, Sir James Scarlett, Sir Frederick Smith, and one or two other members of the Commision, have stated distinctly that they did not know how it affected us.

96. (*Mr. Bouverie.*) Were you before the Commission in any way?—I was unfortunately in India at the time, and therefore, though fully aware what was going on, I was not able to make myself heard.

97. (*Gen. Sir G. Brown.*) Under whose name do you conceive that you ought to stand at present in the general list. I do not refer to any of the Queen's aides-de-camp, or the distinguished service officers?—I will read the list in the form in which it would stand. After the name "Teesdale" would come the names "Troubridge, Griffith, Smith, Herbert."

98. (*Chairman.*) Your claim is identical with that of General Lindsay on the part of those officers, and is distinctly shown by the paper which is placed before the Commission?—Yes.

99. (*Gen. Sir G. Brown.*) Do you claim to be next below Colonel Teesdale?—With the exception of the other officers of the same class as myself. I was promoted in June 1855 to be colonel, and I claim to stand under the lieutenant-colonel who had completed three years' service as a lieutenant-colonel the day previous to my promotion.

100. You claim to be under Colonel Teesdale in the general list?—Yes.

101. (*Lieut.-Gen. the Earl of Rosslyn.*) You do not claim to be above Colonel Troubridge?—No, although he was a major when I was lieutenant-colonel. At the battle of Inkermann he was promoted to the rank of lieutenant-colonel—I remained in the rank of lieutenant-colonel which I held before the war began—he was promoted by Her Majesty on the parade at the Horse Guards in May 1855, therefore he has a perfect claim to be above me, I having been made a Queen's aide-de-camp in June 1855.

102. (*Gen. Sir G. Brown.*) Her Majesty chose to make him an aide-de-camp on that occasion, and you were promoted while in the Crimea, that is all the difference?—Yes, I was promoted later.

103. (*Maj.-Gen. Russell.*) You claim to be thirty-six higher than you are, according to this list, do you not?—No, about twenty places higher.

104. (*Chairman.*) You gave evidence, I think, before Sir Charles Yorke's Committee?—Yes, I did.

105. And in that evidence you stated, in reference to those who had been lieutenant-colonel previously to the year 1854, that what they were justly entitled to was protection from injury by this new rule?—Yes.

106. "They never complained (or if they did their "complaint was not on tenable grounds) that officers "had been promoted over them for distinguished ser- "vice, because that was an old practice before they "entered the service. Protection from injury from "the new rule was therefore what they were entitled "to." That was your evidence then?—Yes.

107. Do you remain of the same opinion still?—Certainly, unless as to the words "distinguished service," there may be a technical objection; with that exception I do, certainly.

108. It is your opinion that they ought to be protected from injury from the new rule?—Yes.

109. Previously to the year 1854 the promotion from the rank of lieutenant-colonel to that of colonel was strictly by seniority, with the exception of officers appointed aides-de-camp to the Sovereign, and of certain promotions in the household troops, &c.?—Yes, it was, to the best of my knowledge.

110. There was no instance, previously to the warrant of 1854, of any officer having been promoted from the rank of lieutenant-colonel to that of colonel for distinguished service in the field, except as Queen's aide-de-camp?—I believe not.

111. But although it had been customary to give brevet promotion in the junior branches of the service, for instance, from captain to major, and from major to lieutenant-colonel, as a reward for service, it has never been the custom to do so in the higher ranks, for instance from lieutenant-colonel to colonel ?—I cannot give an unqualified answer. I can only say that, when it was considered desirable to promote an officer to the rank of colonel from lieutenant-colonel, it was invariably done by making him an aide-de-camp to the Sovereign.

112. Therefore any system which introduced the custom of promoting from lieutenant colonels to colonels, without making them Queen's aides-de-camp, was a new regulation ?—Yes.

113. You stated that you considered that those officers ought to be protected from any injury arising out of the new warrant. I take it for granted, therefore, that you think they ought to be protected against any injury that would arise from that new rule ?—Certainly.

114. Then although the plan which you propose of making every one of those lieutenant-colonels a colonel after three years' service would clearly have protected them against any supercession on account of that portion of the new rule which related merely to service, it would not have protected them the moment it became a question entirely of promotion on account of distinguished service ?—I wish to explain on that point that I am here to urge the case of the Queen's aides-de-camp as being one of them, and of course the officers who were promoted in the other form will state their own case, but I think that, in fairness to them, I should say that what you have stated would be quite a technical objection, because inasmuch as Her Majesty was not limited in the number of aides-de camp she appointed, she might equally well have made them Queen's aides-de-camp as have promoted them otherwise.

115. Her Majesty might have done so, but she did not ?—Yes.

116. There is a real distinction between the case of Queen's aides-de-camp and distinguished service colonels then, is there not ?—Yes, certainly.

117. And if this promotion of distinguished-service officers had been taking place, the others would not have been protected by the rule with respect to the three years' service ?—Under the warrant, officers were promoted for distinguished service and the others might have had a grievance against them.

118. What is the date of your promotion as a Queen's aide-de-camp ?—June 1855.

119. Sir Thomas Troubridge was the first Queen's aide-de-camp promoted, I believe ?—Yes ; Sir Thomas Troubridge was promoted in May 1855.

120. Then there was a batch of five or six of whom you were one ?—Yes, six.

121. The next promotion was on account of distinguished service, but the officer so promoted was junior to you ?—Yes ; quite so.

122. Therefore what you state is this, that those officers who were lieutenant-colonels had a clear right to be protected against any injury from the new rule, but that they had no right to claim protection from the rules to which they were subject before the new rule came into operation ?—Just so.

123. Then, as far as your case is concerned, if any distinguished service officer was placed over their heads, by even the second part of the rule, you claim that they could not object to your promotion because they would have been perfectly liable to that before the warrant of 1854 ?—Just so.

124. You stated that the Royal Commission of 1854 shrank from including the whole of the officers in the brevet which they recommended ?—That is the inference that I have drawn myself.

125. Surely the Royal Commission of 1854 merely recommended a general brevet ?—Yes.

126. Do you think they could have gone further—they merely make a recommendation and the acting upon the recommendation is left to others ?—Yes. I mean simply that they shrank from making the recommendation.

127. We have no means of knowing what their recommendation was because it is general—is not that the case ?—I think they recommend an extended brevet in their report.

128. These are their words : "We should therefore "humbly recommend to Your Majesty that, before "our suggestions are adopted, should they meet with "Your Majesty's approbation, a general brevet should "be granted." I merely wish to point out to you that the Royal Commission would never take upon themselves to decide upon an extension of that brevet ?—Yes, the term "general brevet" was one commonly used. If the Royal Commission had intended to recommend the promotion of all existing lieutenant-colonels to the rank of colonel, they were quite at liberty to say so, and it appears improbable that they would have omitted doing so.

129. The Commissioners further say : "We have "hitherto considered the question before us only "with reference to the permanent system of promo-"tion to be established ; we are, however, aware "that if this system were at once substituted for "that which has been hitherto in force, without "adopting some means to protect the interests of "those whose prospects would be affected by the "change, much injustice would be inflicted on many "officers who have relied on the continuance of the "present regulations. We are of opinion that a "liberal view ought to be taken of the claims of "these officers, and that in introducing a change "which the public good requires, they ought to be "carefully protected from injury and from having "their just expectations disappointed. We would "therefore humbly recommend to Your Majesty that, "before our suggestions are adopted, should they "meet with Your Majesty's approbation, a general "brevet should be granted" ?—Yes, that was their recommendation.

130. I suppose you admit that if that recommendation of the Royal Commissioners of 1854 had been carried out at that time to the full extent, if the whole of those lieutenant-colonels had been appointed colonels, by a brevet including all of them, you would have had no cause of complaint ?—I cannot answer that question directly, because it makes an assumption which I do not admit. I can only say if they had so recommended, and if that recommendation had been carried out, and the brevet had included the whole of the lieutenant-colonels, of course there would have been nothing more to be said about it.

131. The Royal Commission which sat in 1858 to remedy what was admitted by everybody to have been a great grievance, inflicted by the warrant of 1854, did recommend that step to be adopted, and that is what you now complain of ; is not that the case ?—Yes, they did recommend it, not knowing how it would affect the class of officers who had been promoted for distinguished service in the interim.

132. (*Gen. Sir G. Brown.*) When you say "not knowing," you mean, I presume, not considering how it would affect them ?—Lord Herbert stated that he was not aware of it, and Sir Frederick Smith did the same.

133. If they had considered the subject they must have seen that, must they not ?—They considered the subject, but it is a most complicated thing ; they stated that they were not aware of it.

134. (*Maj.-Gen. Rumley.*) That is to say, some of the Commissioners stated so ?—Yes.

135. (*Chairman.*) I believe Major-General Lindsay was examined before the Royal Commission, was he not ?—He was, and stated his case. I think you will see, from the many questions directed to him, that, at any rate the chairman, Lord Herbert, did not understand it.

136. Then it is not correct to say the case was not brought before them ; you mean rather that they did not understand it ?—I did not say that it was not brought before them.

*Col. the Hon. P. E. Herbert.*

16 May 1863.

137. We are not then to assume that the attention of the Commission was never drawn to the subject, but on the contrary that it was?—I did not say so. General Lindsay endeavoured to draw their attention to it, but I think you may judge from the report that their attention had not been sufficiently drawn to it for them to be aware of the effect of their recommendation. I do not think that the point is material. If it is proved that an injury, which might have been avoided, was inflicted upon Her Majesty's aides-de-camp, by the warrant based upon the report of the Royal Commission of 1858, that injury can be remedied by a new warrant in like manner as the injuries to other officers caused by the warrant of 1854 were remedied in 1858. The intentions of the Royal Commission of 1858 are not the main point to be considered, as it appears to me, but the propriety and justice of their recommendations.

The witness withdrew.

*Col. E. R. Wetherall.*

Colonel Edward R. Wetherall, C.B., A.D.C., Unatt. (*Deputy Quartermaster-General in Ireland*), examined.

138. (*Chairman.*) Is your position exactly the same as that of Colonel Percy Herbert?—As far as regards the action of the warrant upon the Queen's aides-de-camp it is precisely the same.

139. Are you one of those included in the same batch of promotions?—No, I am a Queen's aide-de-camp of the 11th of December 1855, which position I held until November 1858, a period of nearly three years. I then found that by the re-arrangement that took place I went down from number 89 in October 1858 to number 207 in November 1858, by which means I lost 118 steps.

140. I suppose you claim the same right as Colonel Herbert has claimed, and upon the same grounds?—Upon the same grounds.

141. Your ground being that the officers, who were lieutenant-colonels previously to the 20th of June 1854, had no right to be protected from that which they had always been subject to previously to that time?—Precisely, so far as the Queen's aides-de-camp are concerned.

142. Do you admit also, with Colonel Herbert, that they were entitled to protection from any injury arising out of the new rule?—I think they had a fair claim; I do not think they had any right. I conceive that the prerogative of the Crown is undisputed to alter the terms of service of the officers of the army.

143. I do not mean merely a right, but a right derived from the recommendation of the Royal Commission of 1854, which was not carried out by the warrant of 1854?—Yes, I think all lieutenant-colonels up to June 1854 have a fair claim to be put upon the most favoured footing. The whole of the lieutenant-colonels to that date ought to be put upon the same footing. For instance, take the case of an officer who was not employed because he could not get employment, and therefore could not serve his probationary period of three years. I think all lieutenant-colonels up to June 1854 should be promoted to be full colonels after three years' service in that rank, whether they had held a qualifying appointment or not.

144. That would not have protected them from being superseded by officers of distinguished service?—Certainly not.

145. Do you think they ought to have been so protected?—I do not think so.

146. That would have been the effect of it, would it not?—I do not admit their right to be protected from supercession by distinguished-service officers.

147. At all events, if the power actually existed, it was not the custom previously to 1854 to promote from the rank of lieutenant-colonel to the rank of colonel in that manner?—I think the custom existed actually, because every officer promoted as a Queen's aide-de-camp considered that his promotion was for distinguished service.

148. Then there would have been no necessity for any recommendation in the report of the Commissioners of 1854 to adopt the practice, if the Crown had that power?—The Crown had the power. I presume the only reason of the recommendation was that the number of Queen's aides-de-camp might have been inconveniently large.

149. As there were a certain number of Queen's aides-de-camp, although the number you state to be limited, the power would have existed?—The power would have existed.

150. Do you not consider that those officers who, by purchase or otherwise, had arrived at the rank of lieutenant-colonel before 1854, with the understanding that nobody could be placed over their heads, with the exception of the Queen's aides-de-camp, and those promotions in the household troops which carry the rank of colonel, had a right to expect to be protected?—I think they had not a greater right than the full colonels, because at that time no full colonel had been made a major-general over the heads of the other colonels; but at that time a recommendation was made to the Crown to make colonels major-generals over the heads of other colonels, and to promote major-generals to lieutenant-generals over the heads of the other major-generals, and lieutenant-generals to generals over the heads of the other lieutenant-generals, without complaint. If, therefore, the promotion of lieutenant-colonels to colonels for distinguished service is to be annulled, it follows that promotions from similar causes in other ranks should be so also.

151. Do you think that the rank of lieutenant-colonel had no greater claim to protection?—No greater than the rank of major-general, lieutenant-general, or any other.

152. Has there been any instance of giving a colonel brevet rank, and appointing him?—I am not aware of any case, except local rank.

153. (*Lieut. Gen. the Earl of Rosslyn.*) There have been cases of officers being made brigadier-generals?—Yes, "brigadier-general" has never been a recognized rank in the army, it is merely a temporary and local rank, but Sir Richard Airey and others were made major-generals and placed upon the establishment of general officers and no complaint was made. Sir Richard Airey, Sir James Yorke Scarlett, Sir George Buller, Sir R. J. Dacres, Sir Hugh Rose, Lord Cardigan, and others, were all made major-generals over the heads of the other colonels in the army.

154. (*Chairman.*) Your opinion is that these lieutenant-colonels had no right to protection?—No greater right than that of the colonels and major-generals of the army to similar protection.

155. Supposing that the Commissioners of 1854 and 1858 had taken a different view from yours of that question, and had decided that they ought to be protected against that which was a new rule, it would have been necessary, upon the first appointment to a colonelcy of one of those lieutenant-colonels for distinguished service, to promote the whole of the lieutenant-colonels to the rank of colonel, would it not?—If they had taken that view, decidedly.

156. The result would have been, would it not, that although it would not have been necessary to promote them immediately to the rank of colonel, and although they would have been fully protected by the rule laid down for three years' service against being superseded by the three years' service officers, yet it would have been necessary, if they were to be protected against being passed over by the distinguished service officers, to make them full colonels upon the occasion of the first of those officers being promoted?—Yes, it would have been necessary to do so. That could not have been the intention of the framers of the report of the Royal Commission, otherwise some such provision would have been placed in it.

157. I understood you and Colonel Herbert to admit that you thought they were fully entitled to protection from injury under the new rule?—In speaking of protection from the new rule, I only include so far as regards the officers who were promoted after having served their qualifying period of three years.

158. Why would they have been more entitled to protection from one portion of the warrant than from another?—Because the going up after three years' service was a mere matter of rotation; the other was a distinct promotion for distinguished service which every officer had not an opportunity of acquiring. And, as before stated, the right existed previous to the warrant of 1854 to supersede lieutenant-colonels by the promotion of officers to the rank of colonel on appointment as A.D.C. to the Sovereign.

159. There would have been many officers on half-pay who would not have had opportunities of performing the qualifying duties, would there not?—Therefore I say they had fair claims for consideration on that ground; they could perhaps have had no opportunity of serving the three years, and therefore there would be a claim for consideration, and that would be met by promoting all lieutenant-colonels after three years' standing in that rank, whether on service or not; this would have been a great boon to them.

160. It would have protected them against that portion of the warrant, but not against the promotion of distinguished service officers, would it?—Yes, before that warrant, I believe, lieutenant-colonels were nearly 10 years in that rank before they were promoted to the rank of colonel; but by that warrant they were allowed to be only three years before their promotion.

161. (*Gen. Sir G. Brown.*) The same warrant which conceded to the authorities the power of promoting officers for distinguished service, conceded to the lieutenant-colonels the right of promotion after three years' commanding of battalions, did it not?—Yes.

162. The same warrant did both, it conceded on the one side to the officers a limited period of service, and on the other side it conceded to the authorities the power of superseding them, and passing other officers over their heads for distinguished service?—Yes.

163. (*Chairman.*) Both of which were new regulations?—Yes. I wish to state that in my opinion lieutenant-colonels had no greater cause of complaint than the full colonels and major-generals, and no complaint was ever made by officers of these two latter ranks upon the subject. In each of those ranks officers were promoted over the heads of others.

*Col. E. R. Wetherall.*

16 May 1863.

164. If a general brevet in 1854 had included the whole of those lieutenant-colonels, the only effect would have been to retain them in their relative positions to one another?—Yes.

165. It would have given no other advantage?—No.

166. It would only have retained them in the same position in which they were placed?—Precisely.

167. (*Mr. Bouverie.*) What is the advantage of being higher up in the list, as a colonel, rather than lower, is it merely the chance of promotion?—The certainty of promotion to become a major-general, and the ultimate consequence of that promotion, the getting a regiment early.

168. That is the sole advantage of precedence in rank?—Yes, that is the whole advantage of the military service. The only advantage which one man has over another is his superior rank.

169. (*Chairman.*) The opportunities of promotion from the rank of colonel, or of employment as major-general, or even of getting a regiment, are not limited to the relative positions in which the officers stand, are they?—They are not limited, because there is the chance of reward for distinguished service, but an officer's health may fail, and he may never have an opportunity of going on service again.

170. Having been promoted for distinguished service he has a claim, and it has been recognized that he has a claim, over others?—Yes.

171. One of the proposals, made by General Lindsay, in order to meet this case that has arisen was that the distinguished service officers should have their commissions antedated, and that they should become majors one day, and lieutenant-colonels the next day?—Yes.

172. There was no rule of the service which required any certain length of service between the ranks of lieutenant-colonel and colonel?—No.

173. Although that was required in certain junior ranks of the service, was it not?—Yes.

174. Your claim is clearly shown on the paper which was laid before the Commission by General Lindsay, is it not?—Yes. I claim to be next above Colonel Smith O'Connor, because he could not have been a full colonel before 1856 on the most favourable interpretation which can be put upon the Royal warrant.

175. (*Gen. Sir G. Brown.*) In the general list you would be next below Colonel Shuttleworth?—Yes, as the list now stands, but actually below Colonel McMurdo in the revised list, for he is an aide-de-camp to the Queen.

The witness withdrew.

Colonel Sir Alfred H. Horsford, K.C.B., Unatt. (*Deputy Adjutant-General*), examined.

*Col. Sir A. H. Horsford.*

176. (*Chairman.*) I believe you have expressed a desire to be examined before this Commission in order to state your objections to the proposed change?—I have sent in a short statement, but, as I thought you perhaps would wish it, I have come, in case I should be wanted, but, beyond what I have stated, I have scarcely anything to say. Of course I can have no reason to wish to have the state of things altered. I am perfectly satisfied with it as it is. Perhaps I had better read my statement. "In consequence of a clause in the London Gazette, dated "8th May, requiring officers to bring their claims "before the Commissioners appointed by Her Majesty "to consider the expediency of altering the present "position of colonels, I beg leave to forward a "summary of the services by which I attained the "rank which I hold in Her Majesty's army, and what "I deem to be their bearing on the present question. "I trust, however, that this statement will be accepted as merely detailing personal claims, and intending no disparagement whatever to the services "of others. The Kaffir war, of 1846 and 1847, found "me a captain in the rifle brigade; I was entrusted "with a wing of my battalion, which I took from the "Mediterranean to the seat of war, and which remained under my separate command for several "months previous to joining head-quarters. In that "war the services of the regiment were considered so "satisfactory, that upon hostilities being renewed in "1852, it was again selected by the late Duke of "Wellington to take part in that campaign. I then "had the honour, as a major, of commanding the "1st battalion, and, in consequence of being mentioned in orders, was promoted to the rank of "lieutenant-colonel."

177. (*Mr. Bouverie.*) At what date was that?—I was promoted in May 1853.

178. (*Chairman.*) You got brevet rank for services in the field?—I got brevet rank for services in the field. "In the Crimean campaign of 1854, owing to "the death of the senior major and to the lieutenant-colonel being in command of a brigade, I commanded "the regiment from its landing to the end of the year, "when I was invalided. This included the battles of "Alma, where we were, however, acting as reserve, "Balaklava, and Inkermann, and, for these services, "by the general promotion which took place in consequence, I received the honour of the Companionship

*Col. Sir H. Horsford.*

May 1863.

" of the Bath and the substantive rank of lieutenant-colonel. Having, in the year 1855, formed the 3d battalion rifle brigade, I took it in 1857 to India, where, from February 1858 until the end of the mutiny, I commanded a brigade. For this Her Majesty raised me to the rank of Knight Commander of the Bath, and I was also deemed deserving of a good-service pension. With regard to these services bearing on the question now before the Commission, I have respectfully to submit that, having been thought worthy of promotion at a period anterior to the promotion of the officers whose position is now under discussion, I cannot but consider it would be hard upon me to be passed over by younger soldiers, unless their services shall be considered to have been superior to mine. Though admitting that the officers, now designated as the 'Distinguished Service Colonels', have stood at one time, in consequence of their promotion by Her Majesty, higher in the *Army List* than myself, still that same undoubted prerogative thought it proper to restore me, and other older soldiers, to our previous seniority. It should also be borne in mind that the generality of these officers, though at present dissatisfied with their position, are still very great gainers; and though justice has been done to others, nothing has been taken from *them*. In thus advocating what I consider my own claims, I beg to point out that I deem myself the more bound to do so, inasmuch as the interests of older soldiers than myself would be deteriorated by any alteration in the seniority now in question."

179. (*Chairman.*) You were appointed a brevet lieutenant-colonel, from the rank of major, in consequence of distinguished service in the field, were you not?—Yes.

180. But you would not have been eligible for a further step of brevet rank unless you were made a Queen's aide-de-camp until this warrant of 1854 came into operation?—No.

181. What you complain of is being superseded by officers for distinguished service in the field, as you might have received the same if such a custom had existed previously to the warrant of 1854?—Yes.

182. Therefore you complained of having been injuriously affected by one of the new regulations introduced by the warrant of 1854?—I did.

183. And you claimed that the protection, which the Commissioners of 1854 laid down in their report, ought to be extended to those who held the rank of lieutenant-colonel at that time, but which was not carried out in the warrant of 1854, framed upon that report?—Yes; I may say also, because it is supposed that when the Commission were inquiring into the subject they had forgotten and passed over the claims of the distinguished service officers, I have reason to believe that if the whole of them were asked the question they would not say that.

184. You were not present at that time?—No, I was in India.

185. Was His Royal Highness the Commander-in-Chief a member of that Commission?—Yes; and General Eyre and several others. I think they would not say that.

186. (*Gen. Sir G. Brown.*) You were not recommended for promotion on account of distinguished service in the Crimea?—I was not.

187. Colonel Norcott, I believe, was recommended?—Yes he was made a Queen's aide-de-camp.

188. That was for services in the field?—Yes.

189. (*Mr. Bouverie.*) As I understand it, these distinguished service colonels were over your head between 1854 and 1858?—Yes, up to 1858.

190. Then, in consequence of the change upon the recommendation of the Commission, you were put back into what you conceive to be your proper position?—Yes, as having been promoted for services in 1853.

191. (*Gen. Sir G. Brown.*) All these officers who are underlined here—the Queen's aides-de-camp and the distinguished service colonels—stood above you in the list up to 1858, did they not?—They did.

192. (*Mr. Bouverie.*) Were you a complainant in any way before that Commission?—No, I was not; I was in India. Now having, as we thought, received our rights, I was anxious that the state of things should not be altered, but should remain as it is.

193. (*Gen. Sir G. Brown.*) Did not Colonel Norcott command the 1st battation of the rifles during the greater part of the siege?—He was a major in the 2nd battalion in the early part, I was a brevet lieutenant-colonel in the first battalion.

194. You were not senior to him, were you?—He was senior to me in the regiment, but I commanded the 1st battalion till the end of 1854.

195. (*Gen. Sir A. Woodford.*) What was the date of your appointment as lieutenant-colonel?—May 1853.

196. (*Mr. Bouverie.*) You became a full colonel in 1856?—I should have been one on the 28th of May 1856 had it not been for certain deductions, which caused the rank to be postponed till September 1857.

197. You would have become so under the new rule?—Yes, after three years in command of a regiment.

198. That is, in 1856?—In 1857, by calculating the deductions referred to.

199. In the meantime, if an officer had become a colonel, as a Queen's aide-de-camp, for service in the field, then there would have been, according to the practice in the army, no just ground for a feeling of supercession on your part, would there?—The only question is, whether it was intended that officers should rise two steps at once—whether majors were intended to be made at once full colonels by brevet in a few days. It is not for me to say whether Her Majesty intended to give two steps to an officer instead of one.

200. (*Chairman.*) You were always liable, while serving as lieutenant-colonel, to be superseded by any person whom Her Majesty might choose to select?—Yes, but at the time I was a lieutenant-colonel some of those officers were only captains.

201. (*Mr. Bouverie.*) Was it ever the practice in the army to make a captain a Queen's aide-de-camp?—No, he must be a lieutenant-colonel; but some of those officers were made majors, and then lieutenant-colonels, and then full colonels, almost all in the same Gazette.

202. In one breath, as it were?—Yes.

203. (*Lieut.-Gen. the Earl of Rosslyn.*) You mean to say within a month?—Within little more.

204. (*Mr. Bouverie.*) That might have been done under the old system, might it not?—An officer might have been raised from a captain to a full colonel, if Her Majesty had pleased, by making him Queen's aide-de-camp, but he would have had to go through the rotation of the other ranks.

205. (*Chairman.*) Is there any rule with regard to a certain length of service in one rank being required, as is the case in some other ranks, before an officer can be made a Queen's aide-de-camp?—No, I do not think there is any rule laid down for an aide-de-campship.

206. Then a man might go from the junior rank of ensign?—So he might.

207. (*Gen. Sir A. Woodford.*) But that is not the custom of the service?—No.

208. (*Chairman.*) It requires a certain number of years' service in almost every grade of the service, until you come to the rank of lieutenant-colonel, and then there is no fixed period which it is necessary to serve before a man becomes eligible to be made a colonel?—No, not according to that rule.

209. (*Maj.-Gen. D. Russell.*) A captain must serve six years before he can be made a major, must he not?—Yes.

210. (*Gen. Sir G. Brown.*) The effect of the retrospective measure in 1858 was to place you over the heads of all those officers who had been made colonels some three or four years before you, was it not?—Yes, it was so; but then it must be also borne in mind that those officers, though perhaps not gaining quite so

much as they expected at that time, had still risen and gained a great many steps.

211. (*Chairman.*) The warrant of 1858 placed you exactly in the same position that you would have been in, if the warrant of 1854 had made all the lieutenant-colonels full colonels at that time?—Exactly so; what one feels, of course, is the disappointment that, because one war is not of so much importance as another, what one did in a former war is passed over by the new one, that, in fact, one's services in 1852 and 1853 are not considered of the same importance as those that took place in 1854 and 1855.

212. Do not you consider it injurious to the service that there should be great uncertainty as to the position held by the officers, and that it should be constantly subject to change?—There is a great deal of conversation in military circles upon that very same subject. Officers feel a degree of uncertainty as to their position in the *Army List;* no man knows where he will stand. I hear men daily saying, if I am passed over one day, to-morrow I may find myself at the bottom of the list of colonels.

*Col. Sir A. H. Horsford.*

16 May 1863.

213. Therefore, are you not of opinion that, in making any improvements which may be thought necessary, all existing interests ought to be protected?—I am. I have always thought so, but that is a thing that must cut both ways, with them as well as with me.

214. (*Maj.-Gen. Russell.*) From your official position, and the means which it gives you of knowing the general feeling of army officers, are you of opinion that further change would shake all confidence in the permanence of the existing system, and in the security of the position of the officers themselves?—My belief, from the general tenor of the conversations I have heard, is that it would, on the whole, create an uncertainty as to the position which officers hold in the army.

The witness withdrew.

Colonel F. Darley George, C.B., Unatt., examined.

*Col. F. D. George.*

215. (*Chairman.*) I believe you wish to state your case to the Commission with respect to the claims of the distinguished service officers, and the Queen's aides-de-camp?—I come here respectfully to enter my protest against any supercession on the grounds of the application on behalf of these officers, whether promoted as Queen's aides-de-camp, or for so called distinguished service in the field. I conceive that the whole of the class of the old lieutenant-colonels prior to the 20th of June 1854, as was distinctly affirmed by the Royal Commission of 1854, in their report, had equally a vested right (with those included in the Gazette of the 20th of June 1854) in their Commissions, and that our interests should be carefully protected from injury, and that our just expectations should not be disappointed by any new warrant that should be issued. We were *de jure* colonels on the 28th November 1854, equally with those who are included in the last general brevet that took place prior to the abolition of all general brevets. We became *de facto* colonels, by the recommendation of the Commission of 1858 that we should be *de facto* colonels of the date of 28th of November 1854. In fact, it was considered merely an extension of the general brevet of 28th November 1854 to all lieutenant-colonels actually gazetted as such prior to that date, and effectually protected them from injury by supercession of their juniors, who were promoted in an unprecedented manner, under the provisions of the warrant of 1854.

216. That part of the Report of the Royal Commission of 1854 to which you allude is, I suppose, paragraph 52?—Yes, "we have hitherto considered the "question before us only with reference to the per- "manent system of promotion to be established. We "are, however, aware, that if this system were at "once substituted for that which has been hitherto "in force, without adopting some means to protect the "interests of those whose prospects would be affected "by the change, much injustice would be inflicted on "many officers who have relied on the continuance "of the present regulations."

217. That is the portion of the report of the Royal Commission to which you alluded in the statement you have made?—I did, I most emphatically rely on it. I was abroad at the time when this inquiry of 1858 came on, serving on the staff in the West Indies. I was relieved at the time of my return home under the provision of that new warrant; when I accepted that staff appointment I could have held it until I was a major-general, otherwise I would never have given up my full pay majority in the 22nd regiment. I served, I hope, with some credit to myself in that regiment for many years. The first step I ever got without purchase was brevet-major and C.B. (4th July 1843) for my services in the Scinde campaign, that is 12 years prior to the promotion of these distinguished colonels and Queen's aides-de-camp in 1855–56. I was also recommended in the strongest manner by Sir Charles Napier for promotion, and was offered and accepted the staff appointment of deputy adjutant-general in the Windward and Leeward Islands, with the brevet of lieutenant-colonel, 4th February 1853, and was placed on half-pay as major 22d regiment without receiving the difference, and my vacancy went without purchase in the corps. Thus I accepted staff employ under the old regulations, and have been deprived of it by the retrospective action of the new warrants of 1854, 1858.

218. Having obtained the rank of lieutenant-colonel proviously to June 1854, you considered, did you not, that, according to the rules of the service, you could not be passed over by any officers unless they were appointed Queen's aides-de-camp?—Not according to the old regulations then in force.

219. Previously to the 20th of June 1854, or any Royal Commission sitting at all, that was the understanding upon which every lieutenant-colonel, who had obtained that rank, acted, namely, that from that rank upwards it was purely seniority of promotion, with the exception always of the undoubted prerogative of the Sovereign to appoint an aide-de-camp?—Yes, I would be the last to question Her Majesty's prerogative to the fullest extent that Her Majesty, through her advisers, should think proper, but all Sovereigns alike must be just before they are generous. We were promoted to the rank of lieutenant-colonel prior to 20th of June 1854, and protection was not then given to us as clearly promised. The Royal Commissioners of 1858 distinctly affirmed that, and you know who they were, men of the same experience as those whom I have the honour to address now, and equally competent to decide upon it. Those Commissioners saw the injury which would be inflicted upon the old class of lieutenant-colonels of the army if the new system was at once introduced. I do not only refer to the distinguished service colonels, a new rank altogether. I say nothing upon that, because that part of the case has been almost abandoned, but I say that Her Majesty's prerogative has been exercised to a degree before unknown in the creation of aides-de-camp with rank of colonel.

220. Previously to the 20th June 1854, was not it the fact that there was no instance of an officer being promoted to the rank of colonel for distinguished service, except by being made a Queen's aide-de-camp?—I never heard of any.

221. Therefore that was a new promotion under the new warrant of 1854, and that you complain of as a grievance?—I do not complain of these warrants. I fully concur in their general provisions, but I again protest at being subjected retrospectively to them, and being superseded either on the list of colonels of 28th November 1854, as they now stand, or on the established

*Col. F. D. George.*
16 May 1863.

list of major-generals on unattached pay hereafter, by junior lieutenant-colonels, promoted on or subsequently to 20th June 1854 under those warrants, either by three or five years' service, as lieutenant-colonels, or for distinguished service, or even as Queen's aides-de-camp; for the Queen's prerogative is as unquestionably exercised in carefully guarding say 60 old lieutenant-colonels gazetted as such prior to 20th June 1854, as in promoting some 20 subsequently in a manner heretofore unknown in the British army.

222. You make a distinction between the warrant and the report of the Royal Commission?—Certainly.

223. Do you imagine that the warrant did not carry out the intentions of the Royal Commissioners by giving you the protection which the Commissioners recommended in their report?—The warrant of 1854 did not, but the warrant of 1858 did, and on the faith of that I held on to the service.

224. If I rightly understand you, in consequence of your having regained your position by the warrant of 1858, you remained in the service, which you would not have done if it had not been for what you considered that act of justice done to you?—There was no intentional injustice, I feel well assured; but mistakes and oversights will occur. In my own instance I have already suffered enough by the loss of my appointment. I had qualified myself for the staff at the senior department, Royal Military College, Sandhurst, in 1834, and I am now still further threatened to be superseded by 21 juniors on the ostensible plea of their having been promoted for service in the field in 1855–56—that is 12 years subsequent to my first promotion for field service to brevet-major and C.B. in 1843. By the warrant of 1858 I regained my position in the service and was fully protected from injury, and resolved to remain in it, otherwise I had seriously contemplated selling out, as I had just returned from five years' service in the West Indies, making a total of 25 in the tropics out of 34 years continuously on full pay.

225. Will you explain what it is you complain of with regard to the staff appointment?—I am willing to submit to that loss if the public good requires it.

226. What was it?—I had been deputy adjutant-general of the Windward and Leeward islands; I could have held that appointment until I came to be major-general, or I could have commanded the 22nd regiment without purchase; I could have held that until I was a major-general, in fact, I gave up regimental for staff employ.

227. Was it the new regulation introduced by the warrant of 1854 which prevented your holding that appointment for more than a certain period of time?—Yes; all my predecessors held that or another; after five years they were usually transferred to the home staff and continued on it till promoted to major-general; there was not a year of my life when I was not in the midst of pestilence and disease there; one epidemic swept off 20,000 of the inhabitants in the course of a few months.

228. Did I rightly understand you to say that you had obtained that staff appointment in consequence of having passed through the military college?—I cannot say that it was in consequence of that; I had qualified myself, and there were not many in those days who had done so. For 20 years I had sought it, and at last Sir Charles Napier recommended me for promotion in consideration of my services. I was six years a brevet major after that campaign in Scinde; I was six years a brevet major and four years a regimental major. I was one of the oldest majors in the army, and I had given a full equivalent for the appointment, as I conceive.

229. Did you obtain the brevet from seniority?—No; after the campaign in Scinde was over the despatches were received home. The last action was fought on the 24th of March 1843—the action of Hyderabad—in which I commanded 22d regiment. I got promoted for that, but not until the 4th of July, for the gazette of that campaign came out on the 4th of July. They took their time to consider. It may perhaps be comparing small things with great to compare that war with the Crimean war, but I may observe that there was only one Queen's aide-de-camp made at that time, an old Bengal officer named Pattel who had been 30 to 40 years in the service. It little mattered to any of us in the Queen's service whether he was promoted or not, but he was the only one made, and he was not made a Queen's aide-de-camp till 4th July 1843.

230. (*Maj.-Gen. Sir W. Brereton.*) You mean to say, that although it is perfectly true that on being made a Queen's aide-de-camp a lieutenant-colonel becomes a full colonel, you believe that that rule was so sparingly applied, as in the instance which you now quote, that only one Queen's aide-de-camp was made after that campaign?—And that an officer of the Bengal army. Lieutenant-Colonel Pennefather was there also, and dangerously wounded at Meeanee; he was senior Queen's officer, and, after Colonel Pattel, next in command to Sir Charles Napier; yet he (Lieutenant-Colonel Pennefather), was only made a C. B. on 4th July 1843, and was not made Queen's aide-de-camp till 1846, being then 28 years in the service, and even then he was thought lucky to be made aide-de-camp to the Queen so soon, or even at all.

231. Then, in point of fact, what you complain of is that the warrant of 1854, has had an *ex post facto* effect?—With me it has had nothing but a retrospective action. I was a lieutenant-colonel on the 4th of February 1853; that appointment was offered to me, I did not ask for it, I had been 20 years in the tropics already, Lord Hardinge knew that, when I told him that, although it was the first appointment which I was offered, I must decline it; he said: "I "will give you a fortnight to think of it, go back to "Brighton, I will not receive your answer under a "fortnight; if you accept it, I will give you six "months' leave in addition on account of your "health."

232. (*Chairman.*) I believe your complaint may be very shortly summed up, namely, that you objected to the operation of the warrant of 1854?—I did, as to its retrospective action.

233. That having been rectified by the warrant of 1858, you object to any re-consideration of that warrant?—I considered that final. After the careful examination it underwent by the Select Committee in 1861 again, surely it was to be hoped that we should have an end of all this agitation. I solemnly declare I would not have remained an hour in the service, could I have foreseen the annoyance which I have been exposed to for four years past.

234. Do you consider a state of uncertainty to be very detrimental to the true interests of the service?—I consider it most prejudicial to discipline and likely to weaken all authority. Who are we to look to now? We must go to the House of Commons, and not to the Horse Guards or War Office.

235. Do you consider that the Commissioners overlooked you in their report in 1854?—In the report they did not overlook us; it was in the warrant we were overlooked. That was set right by the Commission of 1858, and that rectification was accepted by the army and the service at large as a final settlement. It was raked up again in 1861, and now it is going on in 1863. Where is this to stop? I conceive that we are entitled to be clear of all this. I say, let me be secured in my position. I do not question the prerogative at all. I believe I am one of the few staff officers removed from my appointment in consequence of that warrant who have never been employed again, but I am willing to submit to that if younger men are better men. I was only placed in the list of colonels in 1858, where the Commissioners evidently intended I should have been in 1854. Were that so, there could have been no complaint from the distinguished colonels or from any quarter.

236. (*Lieut.-Gen. the Earl of Rosslyn.*) You were actually colonel in 1854, were you not?—By the warrant of 1858; that made me so.

237. (*Gen. Sir G. Brown.*) You were a lieutenant-colonel a little more than a year, I think?—On the 4th of February 1853 I became lieutenant-colonel.

238. You were only a lieutenant-colonel for little better than a year then?—According to the rectification.

239. According to the fact, you were made a full colonel in November 1854, were you not?—I was by the warrant of 1858, not till then.

240. You were a lieutenant-colonel in 1853?—Yes, on the 4th of February, 1853.

241. Then you were for a year and nine months a lieutenant-colonel?—Yes.

242. (*Chairman.*) No absolute length of service was required to enable a lieutenant colonel to become a colonel; you might have been made a colonel the next day, is not that the case?—I never heard of any distinction as to time, it depended on a general brevet, or being made aide-de-camp to the Queen.

243. (*Maj-Gen. Sir W. Brereton.*) If there had been a vacancy you would have gone up?—The promotion was not by vacancy, it was by periodical brevets, before that. I wish to remark that if that comparison is to be instituted as to the time for which the old lieutenant-colonels prior to that warrant were lieutenant-colonels, may I ask that that comparison may be carried out also with regard to those gentlemen who claim to be put over me; some of them went out to the Crimea as captains, and within 12 months they became colonels. If the short length of time between my lieutenant-colonelcy and my colonelcy is to operate against me, or is to be weighed in the balance, I make my claim on account of being a lieutenant-colonel before that warrant, and on the faith of the protection which ought to have been inserted, I believe, in the warrant of 1854.

244. (*Lieut.-Gen. the Earl of Rosslyn.*) What is the date of your commission as field-officer, as major?—The 4th of July 1843, after the campaign in Scinde.

245. Therefore, for 20 years you have served as a field-officer?—I have now been for 20 years a field-officer.

246. (*Gen. Sir G. Brown.*) You did not consider it a grievance when you were a lieutenant-colonel if the Queen chose to appoint an aide-de-camp over your head?—Not according to the old usage of appointing them, very sparingly, from the old lieutenant-colonels.

247. It was the established practice?—Decidedly, as long as I can remember.

248. (*Chairman.*) Do you know any instance of an officer being promoted from the rank of lieutenant-colonel to that of colonel without being made either an aide-de-camp or a distinguished service colonel under the new rule which was not in operation before 1854?—I do not know of any instance. Lieutenant-colonel Fox, though aide-de-camp to William the Fourth, remained a lieutenant-colonel for some years, and I think also another aide-de-camp from the Royal marines, so that the rank of colonel was not after all inseparable from aide-de-camp to the King.

249. (*Maj.-Gen. Sir W. Brereton.*) The only means by which a lieutenant-colonel could pass over the head of his senior lieutenant-colonel was by being appointed a Queen's aide-de-camp, was that not the case?—According to the usage of the service from time immemorial.

250. (*Chairman.*) You know of no instance of officers having been promoted from the rank of lieutenant-colonel to colonel without being made a Queen's aide-de-camp, or by those positions in the Guards which give the rank of colonel, previous to this warrant of 1854?—I never heard of anyone except a major of the guards, who was always major and colonel, and if promoted to major-general received 550*l.* a-year or 600*l.* a-year as unattached pay, if so promoted from lieutenant-colonel of the guards. Since 1856 majorities and lieutenant-colonelcies in the guards are succeeded to without purchase, and guards generals still receive 550*l.* or 600*l.* a-year as unattached pay, although their commissions now cost only 4,800*l.*, that is, 300*l.* above those of the line, and they are still eligible for colonelcies of line regiments, thus retarding the succession of generals of the line, who only receive 25*s.* a-day as unattached pay.

251. (*Mr. Bouverie.*) The question is, do you know of anyone being promoted to the rank of colonel as a reward for distinguished services not being made a Queen's aide-de-camp before the warrant of 1854?—I never heard of it. The only way you could obtain the rank of colonel was by being made a Queen's aide-de-camp; I never heard of any other, except a major of the guards.

252. (*Chairman.*) Although brevet rank was granted in the junior branches of the service, for instance, you would have a brevet major and a brevet lieutenant-colonel?—A brevet major for service in the field, also brevet lieutenant-colonels, both frequently.

253. Therefore, although it was usual in the junior branches of the service, after a major had once obtained the rank of lieutenant-colonel it became a promotion purely by seniority, with the single exception of the Queen's aide-de-camp?—Yes. I have often heard them complaining: "We must bide our "time hereafter, and wait till a brevet comes out "after the next five years," they might be cut off by a mere date and have to wait another five years.

254. However distinguished their services might have been in command of a regiment, previously to 1854 it was not the custom of the service to give the rank of colonel for those services?—I never heard of it. I would also hope that, if any remedial measure be deemed necessary for those gentlemen, it may be borne in mind that the Royal Commissioners said distinctly in 1854 and 1858 that distinguished or deserving officers should be rewarded at the expense of their country, and not at that of their senior officers; and that on that principle there are certain supernumerary generals still remaining, and they will merely succeed when it comes to their turn on the list, preserving their seniority. If in any shape or form 21 juniors are to be placed over me, either on the colonels' or major-generals' list, the injury to me, at my time of life, is irreparable, as they would succeed to colonelcies of regiments before me.

255. In consequence of your age it would be more likely to affect you injuriously?—It would be infinitely more likely to affect these 60 men injuriously by having the 20 men put over them, than it would be to affect the 20 by having the 60 remain where they are. I entered the service before all those in that list but one—he was in the army a year or two before me. I lose two places; there were only two lieutenant-colonels of 1852, and one was a lieutenant-colonel of 1850, and perhaps he is too high up to be affected; all of 1853 are my juniors, and probably 10 years or more younger than myself.

256. (*Gen. Sir G. Brown.*) They are above you in the list?—Those lieutenant-colonels of 1850–52 are of course above me, those of 1853, &c., below me, all being placed as colonels of 28th November 1854, as they stood by seniority on the old list of lieutenant-colonels prior to 20th June 1854, so that I maintain they were not overlooked in the revision of the warrant of 1858, nor by the Special Committee of 1861. If any remedial measure is required I hope and trust that it may be at the expense of the country and not at the expense of the senior officers. I solemnly declare I never would have remained in the service if I could have foreseen all this. I served long in the worst of climates to obtain this rank, which they have got in a moment, one brevet after another being heaped upon them. It cannot be said that it is a usual thing, even in the case of the Queen's aides-de-camp—it is a new thing to appoint them in such numbers and with such rapidity.

The witness withdrew.

Adjourned.

## At the War Office, Pall Mall, Monday, 18th May 1863.

PRESENT:

Lieut.-Gen. Right Hon. J. PEEL.
Right Hon. E. P. BOUVERIE.
Gen. Sir ALEXANDER WOODFORD, G.C.B., G.C.M.G.
Gen. Right Hon. Sir GEORGE BROWN, G.C.B., K.H.
Lieut.-Gen. Right Hon. the EARL OF ROSSLYN.
Major-Gen. Sir WM. BRERETON, K.C.B., K.H.
Major-Gen. HEN. SANDHAM.
Major-Gen. DAVID RUSSELL, C.B.
Major-Gen. RANDAL RUMLEY.

LIEUT.-GEN. RIGHT HON. J. PEEL, IN THE CHAIR.

*Col. J. S. Brownrigg.*

18 May 1863.

Colonel JOHN S. BROWNRIGG, C.B. Unatt., examined.

257. (*Chairman.*) You have made an application, I think, to be examined before this Commission, to make a statement in respect to the subject submitted to their consideration?—Yes. I may venture to say, first of all, that mine is a very peculiar position; I am differently situated, I believe, from every other officer concerned in this enquiry; I am a so-called distinguished-service colonel, and also one of those who have been affected by the retrospective effect of the warrant of 1858.

258. What was your position in 1854?—I was then a lieutenant-colonel.

259. Before the 20th of June 1854?—Yes; I am a lieutenant-colonel of September 1853. When the first batch of officers were recommended to be promoted for distinguished service in the field, after those who were made Queen's aides-de-camp in May and June 1855 (I allude to Colonels Lord West, Wilbraham, Borton, Edwards, Lysons, and Lord Longford), I was recommended by the Commander-in-Chief of the army in the field to be promoted at the same time that they were promoted. My name was excluded from that list by Lord Hardinge, who wrote, or caused to be written, a private letter to Sir James Simpson stating that he could not promote me, or that there were objections to my being promoted, because I was a guardsman. I am one of those who have never, for a moment, thought myself aggrieved or ill-treated by those who were promoted over my head as Queen's aides-de-camp; I consider that it is Her Majesty's prerogative and right to make any officers she pleases her aides-de-camp. I never imagined I was aggrieved by the promotion of my juniors in that respect, but having been recommended by the Commander-in-Chief in the field to be promoted for service in the field in the first batch, I did feel most hardly dealt with in being excluded from that list. I do not venture for a moment to say that I deserved it; there is an officer sitting amongst you who is a much better judge of whether I deserved it, or not, than I can be, but I do say this, that if I deserved promotion in November, when I was promoted, I equally deserved that promotion in July. With regard to the cases of the so-called distinguished-service colonels, I never felt that I had any right, and I never felt any satisfaction at being promoted over the head of a man like Sir Alfred Horsford, who has seen more service in the field than I have; but I did feel most deeply aggrieved by having my juniors (some four or five) placed over my head at the time they were so placed, namely, on the 17th of July, notwithstanding the recommendation which was sent home, with regard to myself, by Sir James Simpson. I was relieved from what I consider this act of injustice, by the retrospective effect of the warrant of 1858, and, for that reason, I would rather that matters remained *in statu quo*. If, however, the Commission consider that I have made out any sort of case, and if they consider, from what I tell them, that I was not fairly treated by my exclusion from that first list, I should venture very respectfully to hope that, if there are to be any further alterations in the list of colonels, my case will be taken into consideration. I claim to be placed, on the list next to Colonel Borton, who was the officer whom I should have stood next to in the list, had my promotion taken place at the time that I was recommended for it.

260. If you had not been recommended at all for promotion as a distinguished-service officer, you would, by the warrant of 1858, have been placed in your old position as a lieutenant-colonel, and have been senior, as I suppose you were placed senior, to those officers who were recommended for distinguished service?—Yes, that is exactly what has happened.

261. You were, in fact, senior to them?—Yes, to some of them.

262. You were replaced, by the warrant of 1858, in the position which you held with regard to those officers who had been recommended for promotion for distinguished service; in fact, you were placed senior to them, were you not?—To some of them. I was replaced above those who had gone over me. I was placed as I originally stood in the *Army List*.

263. I understand you to draw a manifest distinction, between those officers who were made Queen's aides-de-camp and those promoted as distinguished-service colonels?—Yes, I do.

264. You considered, did you not, being a lieutenant-colonel previously to June 1854, that you were at any time liable to be superseded by an officer selected by Her Majesty to be a Queen's aide-de-camp?—Certainly.

265. But you consider that the promotion of officers for distinguished service was one of the new regulations introduced by the warrant of 1854?—Yes.

266. The operation of which you object to, as affecting your interests?—Yes, because I was recommended for promotion by the commander of the army in the field, and his recommendation was not attended to.

267. Supposing you had not been recommended, your position being the same as those of all other officers who were lieutenant-colonels, and who considered themselves protected by the recommendation of the Royal Commission of 1854, did you consider that you were liable to be superseded by any officer who was appointed a Queen's aide-de-camp, but that you were not liable to be superseded by any officer promoted for distinguished service in the field?—Yes; I think there is the broadest distinction, between the Queen's aides-de-camp and distinguished-service officers. I think Her Majesty has a right, not only to make the subaltern of my company in the guards a Queen's aide-de-camp (as she was pleased to do), but my sergeant, if she thought fit; but I think it is a great pity that officers should be selected to be promoted for distinguished service, unless they perform some such extraordinary action as to make it patent to all the world that they deserve it, so that there can be no question about their merits; I think the plan of selecting here and there lieutenant-colonels to be made full colonels for distinguished service, though in fact they have not performed more good service than others, will always have the effect of producing a great deal of jealousy.

268. You have stated that the objection to the recommendation of the Commander-in-Chief, who recommended you for promotion, arose from Lord Hardinge?—Yes.

269. On account of your being a guardsman?—So it was stated in a private letter to Sir James Simpson, which he communicated to me.

270. Are you aware that all the recommendations made from the Crimea went in the first instance to the Commander-in-Chief, that would be to Lord Hardinge, who would then submit them to the Secretary of State for War, and, though his Lordship might admit some of them if he pleased, the Secretary of State for War would decide the question. Are you sure that the objection did not come from the War Office rather than from him?—All I can say, in answer to that, is, that I distinctly remember the letter that was sent to Sir James Simpson; my impression was that it was written by the then Adjutant-General, Sir George Wetherall, and that the letter stated that Sir James Simpson's recommendation, that I should be promoted, had embarrassed Lord Hardinge in consequence of my being a guardsman.

271. What was the position which you held in the Crimea?—I was then assistant adjutant-general of the light division.

272. It was not as a guardsman that you were recommended, but as the assistant adjutant-general?—I never knew that I was recommended at all until Sir James Simpson spoke very kindly to me upon the subject, and appeared much annoyed that I was not promoted. I was first assistant adjutant-general of the first division, and after that I joined the division which General Sir George Brown commanded, in a similar capacity.

273. Then, previously to the issue of the warrant of 1854, there would be no power, or at all events it was not according to the custom of the service, to have made you a colonel without making you a Queen's aide-de-camp?—No, I imagine not. I never heard of such a thing before.

274. (*Maj.-Gen. Sir W. Brereton.*) But, if you had been a colonel before that warrant was issued, no Queen's aide-de-camp could have been put over your head?—Not if I had been a colonel.

275. If you had been a lieutenant-colonel?—I never would venture to complain of Her Majesty's right to promote an aide-de-camp over me in such a case.

276. (*Chairman.*) If you had been a lieutenant-colonel previously to that you would have imagined that a Queen's aide-de-camp could have gone over your head?—Of course.

277. (*Maj.-Gen. Sir W. Brereton.*) Where do you stand now, next to Colonel Mackirdy, I think?—Yes.

278. (*Chairman.*) That is the position you hold as a lieutenant-colonel by the warrant of 1858?—Yes, where the retrospective effect of the warrant of 1858 placed me. I am in exactly the same position as if I had never been promoted at all, but I would rather remain as I am than have my juniors put over my head. I do not want to go over the heads of my seniors, but I have the strongest possible objection to having my juniors put over me; these juniors, according to General Lindsay's arrangement, would be, (including the Queen's aides-de-camp,) Colonels Troubridge, Dickson, Norcott, Gordon, Edwards, Lysons, Lord Longford, and Prince Edward of Saxe Weimar, eight in all.

279. (*Gen. Sir G. Brown.*) You would stand considerably higher on the list than you do now?—I should gain about 10 steps, I think. I should lose eight and gain about 18.

280. (*Lieut.-Gen. the Earl of Rosslyn.*) Then your position would be better?—Yes, but I would rather remain as I am.

281. (*Maj.-Gen. Russell.*) You have drawn a marked distinction, between the officers promoted for distinguished service and the Queen's aides-de-camp, have you not?—Yes.

282. I believe it is not usual, in appointing a Queen's aide-de-camp, to assign any reason for so doing?—I believe none whatever.

283. In the other case it is always stated that it is for distinguished service?—They are expressly gazetted "for distinguished service in the field."

284. (*Mr. Bouverie.*) On what date were you recommended for promotion originally?—I was recommended at the same time as those who were promoted on the 17th of July, and really all that I have to complain of is, that, being recommended, I was excluded from promotion at that time, although officers junior to me were promoted.

285. You would come in after Colonel Borton?—Yes.

286. At the time of the warrant of 1858, did you feel yourself aggrieved at all those officers being promoted over your head?—Not in the least, because they were originally before me. I did not care much about that, the only grievance I had was, that those who were promoted for distinguished service in the field should be put over my head—Colonel Edwards, Colonel Lysons, and Lord Longford, notwithstanding the recommendation of the general commanding the army in the field, who had the best opportunity of judging whether I deserved promotion or not.

287. (*Gen. Sir G. Brown.*) You consider that the grievance of having those half-dozen officers promoted over your head would more than counterbalance the 18 or 20 steps that you would gain on the list?—It is far greater; the one I consider as a positive injury, and the other as a mere sort of negative injury; it is a positive injury to have juniors placed over your head.

288. You would have become a general officer sooner notwithstanding?—Yes, so I should, but it would not alter my opinion that I was hardly treated in having junior officers promoted over my head. If I had not been recommended I should not have cared about it.

289. (*Chairman.*) The most important point in your evidence is the distinction which you draw between Queen's aides-de-camp and officers promoted for distinguished service. You stated that you made no objection to any number of Queen's aides-de-camp being placed over your head, but that, under the operation of that warrant, distinguished-service officers were placed over your head. Did I rightly understand you to say that?—Yes, and because I was recommended for promotion with the first batch who were promoted on the 17th July 1855.

290. (*Maj.-Gen. Russell.*) The Royal Commission of 1854 recommended that the "existing field officers "be allowed to rise by brevet as under the regulations "now in force," and then proposed some new regulations for officers not now of the rank of field officers, one of which was, that they should be promoted after three years' service in certain appointments, which was afterwards embodied in the 8th clause of the Royal Warrant. If that three years' rule were applied to the lieutenant-colonels then existing, would you consider it an infringement of your vested interests?—I should.

291. And against the clause of that Royal Warrant?—And, as it appears to me, against the clause of that Royal Warrant.

292. (*Maj.-Gen. Rumley.*) Nevertheless you do not object to your position in consequence of the warrant, as I understand?—I prefer my present position to that of having my juniors put over my head.

293. (*Chairman.*) Your present position by the warrant of 1858?—Yes.

294. You would rather be in the position which you now hold under the warrant of 1858 than that any alteration should take place?—Yes.

295. (*Maj.-Gen. Russell.*) Were you one of those who were passed over on the occasion of the first brevet on the 28th of November 1854?—I was passed over by some whom I had superseded by my promotion for distinguished service in November 1855, but I in like manner recovered certain steps I had, as I consider, unfairly lost.

296. (*Chairman.*) On the 20th of June 1854 were you a lieutenant-colonel?—Yes, I was a lieutenant-colonel of September 1853.

*Col. J. S. Brownrigg.*

18 May 1863.

297. (*Maj.-Gen. Russell.*) The warrant is dated in October, and the brevet came out on the 28th of November?—It did not affect me, because I was already a lieutenant-colonel.

298. You are in the same position as you always have been in at this moment, are you not?—Yes.

299. (*Mr. Bouverie.*) If all the lieutenant-colonels at the date of the warrant of 1854 had been breveted colonels you would have become a colonel, and would have occupied the place which you now occupy, and which you still wish to occupy?—Precisely.

300. (*Maj.-Gen. Rumley.*) Do I clearly understand that you did not object to the rectification warrant of 1858 having placed so many officers over you as to affect your position in October 1858?—I look upon that as a choice of evils; if I am allowed to remain as I now remain in the *Army List* I shall lose some ten places; I shall not be a major-general so soon as I otherwise should be by some ten places, but I prefer that position to having my juniors placed over my head, as they would be if General Lindsay's proposal is carried out.

301. Then did you consider the rectification warrant a grievance?—No.

The witness withdrew.

*H.R.H. the Duke of Cambridge.*

Field Marshal H.R.H. the Duke of Cambridge, K.G., K.P., G.C.B., G.C.M.G., (*Commanding-in-Chief the Forces*), examined.

302. (*Chairman.*) Your Royal Highness was one of the Royal Commissioners appointed by Her Majesty in 1858 to consider the working of the warrant of 1854?—Yes. I wish to lay before the Commission a letter; it is from Sir Henry Storks to the military secretary: "War Office, 9th December 1858. Sir: In returning the enclosures of your letter of the 27th ultimo relative to the position of Colonel Sir Thomas Troubridge and Colonel Lysons in the list of the colonels of the army, I am directed to acquaint you, for the information of his Royal Highness the General commanding in chief, that Secretary Major-General Peel is of opinion that these officers occupy their proper places in the list in accordance with the Royal warrant of the 14th of October 1858, and he sees no reason to disturb the present arrangement."

303. It was recommended by the Commissioners of 1858, in their report, to replace all the officers who had been superseded by the effects of the warrant of 1854, was not it?—Yes, it was.

304. Was any evidence taken before those Royal Commissioners, or was their attention drawn to the cases of certain officers whose cases are now submitted to us by Her Majesty, and who considered that they might be ill treated, provided that all the officers were replaced in the position in which they had stood by the warrant of 1854?—I consider it was.

305. It was brought before them?—Yes, I consider so. I consider that it was brought before the Commissioners on the 28th of April 1858 in General Lindsay's evidence. Our attention was called to those particular officers.

Appendix, page 61.

306. As you have already stated, the Commission recommended that all those officers, who had been lieutenant-colonels previously to the 20th June 1854, and who had been superseded by several officers in consequence of the warrant of 6th October of that year, should have their commissions antedated so as to place them in the same relative positions as those in which they would have stood in 1854 with regard to one another?—Exactly so.

307. Subsequently to the report of the Royal Commission of 1858 and the warrant, attention was directed to the case of those distinguished officers, I think?—Certainly.

308. In fact the very letter which your Royal Highness has put in shows it, it having been addressed, in the first instance, to the then Secretary of State, myself, in 1858?—Yes, exactly; that letter was dated 27th November 1858.

309. In July 1861, a committee was appointed, of which Sir Charles Yorke was chairman, and which reported, on 8th August 1861, General Lindsay dissenting from the report of the other Commissioners?—Yes.

310. In consequence of General Lindsay's statement a correspondence has taken place between the War Office and the Horse Guards and the Treasury?—It has.

311. With reference to that correspondence, there is a letter written from the War Office on the 26th January 1863 (at page 4 of the papers laid before us); it is addressed by General Forster to the Under Secretary of State for War, and he concludes by saying, "I have to add that it is proposed to discuss the subject at the meeting at the War Office on Wednesday next"?—Yes.

312. That meeting at the War Office is, I take for granted, one of those meetings established by your Royal Highness and myself, during the time I was Secretary of State for War, in which the Secretary of State for War, and the Commander-in-Chief, and the staff of both departments, meet for the purpose of discussing subjects in order to prevent needless correspondence, and, in fact, to settle matters by mutual understanding?—Yes, exactly.

313. Therefore I take it for granted that at such a meeting this subject was fully discussed between the heads of the departments?—Yes, between the heads of the departments.

314. That being on the 26th of January; on the 7th of February 1863, General Forster writes to the Under Secretary of State, which, I take for granted, is the official way of placing on record what took place at that meeting: "I am directed to request you to acquaint Secretary Sir G. C. Lewis that the Field Marshal commanding in chief having further reconsidered the question, is of opinion that the objections to the proposal are so great that His Royal Highness does not feel justified in agreeing to it." I wish to ask your Royal Highness to favour this Commission by a statement of what the objections referred to in that letter are?—My objections are the original objections which I made to the proposal when it was originally made. I forget the exact date now; it was in 1858 I think when it was first mooted.

315. (*Mr. Bouverie.*) Your Royal Highness refers to Sir Charles Yorke's letter, dated the 26th September 1859?—Exactly, and I adhere to the opinion I expressed in that letter. I will amplify my reason, if the Commission will allow me. I consider that the officers complaining have never been superseded, and for this reason, because I consider that the warrant of 1858 corrected an error in the warrant of 1854. The warrant of 1858 did that which ought to have been done, and which it was acknowledged ought to have been done, in 1854; consequently, if what ought to have been done in 1854, which was done in 1858, had been done in 1854, those officers never would have gone over the heads of those who they now complain have superseded them. Therefore in equity I consider that they never have been superseded.

316. What was done in 1858 was really done as a correction of what was done in 1854, was it not?—I consider that what was done in 1858 was a mere correction of an error in the warrant of 1854, and that, therefore, whatever occurred in the meantime, until that correction was made, was really as nothing as regards the position of those officers.

317. (*Chairman.*) The Royal Commissioners of 1854, in their report, recommended the introduction of two new means of appointment from the rank of lieutenant-colonel to that of colonel?—Yes.

318. The one being by a three years' service and the other by promotion for distinguished service in the field?—Exactly so.

319. At the same time they recommended that all existing interests should be protected?—Exactly.

320. Unfortunately the warrant of 1854 did not embody the recommendation of the Commissioners?—Exactly.

321. And the existing interests were not protected by the warrant of 1854?—Just so.

322. The consequence was that those officers were superseded constantly, by others having served three years, and the grievance became so great that, in 1858, your Royal Highness drew my attention to it, and it was agreed to appoint another Royal Commission?—Yes.

323. As I understand it, the present objectors, that is these 21 officers, admit the right of those officers who were lieutenant-colonels previously to the 20th June 1854 to be protected against the operation of any clauses in the new warrant of 1854?—Yes.

324. But they state that they would have been protected if the three years' rule had been applied to them, and if they had each been appointed to the rank of lieutenant-colonel on three years' service, and therefore they have no right to be protected against that which they were subjected to previously to the warrant of 1854—they were always subject to having Queen's aides-de-camp placed over their heads—and therefore they say they have no right to claim to be protected against that. The three years' service would protect them against any person being placed over their heads by three years' service, but it would not protect them against having officers placed over their heads for distinguished service in the field?—No.

325. Therefore, in order to protect them from the provisions of the warrant of 1854, it was considered, by the Royal Commission of 1858, necessary that they should be made colonels of 1854?—Yes, that they should be made colonels of 1854. I do not consider that the three years' rule is applicable to them, for this reason, because I consider that when these officers reached their rank of lieutenant-colonel the three years' rule did not exist—the consequence was that their birthright in the army was to go up without supercession. Now, to apply to these officers the three years' rule would be in principle most erroneous, because that rule did not exist when they ought to have been promoted, and therefore I object to their being put up by the three years' rule, which I know is now the position which they take.

326. (*Mr. Bouverie.*) Was that a matter considered by the Commission of 1858, with a view to meeting the difficulty created by the warrant of 1854?—I am not prepared to say that, but I think if mooted it would have been unanswerable.

327. Your Royal Highness would then have entertained your opinion as strongly as now?—Just so.

328. General Lindsay suggests on the part of these officers that the proper arrangement that ought to have been made in 1858 was not to promote all those officers from the date of 1854, but to promote them as they would have been promoted under the new warrant after three years' service; do you entertain an objection to that?—I do entertain an objection, because I consider that the injury done to those officers was done before that rule came into operation.

329. (*Chairman.*) Without doubting for a moment, but acknowledging at once, the undoubted power of the Sovereign to make alterations from time to time in the conditions of the service, do you not think it ought always to be done, as far as possible, by protecting the existing interests of those who have entered into the service upon certain conditions, and do you not, as Commander-in-Chief, consider that it is a great detriment to the army that there should be a state of uncertainty prevailing as to the relative positions of officers being from time to time changed by different warrants and different regulations, without protecting the positions of officers who have obtained their promotion under certain conditions?—I think nothing could be so objectionable as a constant change of system; I think, though probably, at the time, the change of system was essential, still all the vested interests then existing ought to have been protected up to the time when that came into operation. On that ground the warrant of 1858 was established to correct the error of 1854; otherwise the warrant of 1858 would have been an unjustifiable warrant. The object of the warrant of 1858 was to meet the objection which is now put forward so strongly, to meet the injustice to the service of making any regulation retrospective, which it would have been if the warrant of 1854 had not been altered by the warrant of 1858.

330. I ask whether, in your position as Commander-in-Chief, you are aware that at the present moment there is very great anxiety amongst officers in the army as to changes taking place?—I think the feeling of the army, as far as my knowledge goes, is very much opposed to any change; and it is because of that, and because I think the feeling is a just one, that I have so strenuously and repeatedly objected to various proposals which have been made to put these officers up again in the list. I hope the Commission rightly understand the grounds of my evidence. I should personally regret exceedingly that these officers should be placed in a painful position to themselves, but I think it would be much worse, as regards the interests of the army, if you were to readjust the position of those officers, because you would injure, in my opinion, a very much larger number of officers by any change than the few officers now affected, and who certainly, by an accident, got up much higher than I believe could ever have been expected by them.

331. Do you consider that previously to the year 1854 no person could have been placed over the head of a lieutenant-colonel except by being appointed a Queen's aide-de-camp, or by certain ranks in the guards, which, I believe, give the rank of colonel?—Yes, that was the army regulation.

332. Did that exist previously to the warrant of 1854?—Certainly.

333. Do you not consider that there is a distinction, therefore, between officers promoted for distinguished service to the rank of colonel and those made Queen's aides-de-camp?—The appointment of Queen's aide-de-camp is a very old institution, and the other appointment is under the new rule.

334. Introduced by the warrant of 1854?—Exactly. I do not know any instance of a lieutenant-colonel being made a colonel over the heads of other colonels except as a Queen's aide-de-camp. I do not believe there is any instance previously to 1854.

335. Before that it was not the practice to make an officer a colonel out of his turn, except by appointing him a Queen's aide-de-camp?—Not that I know of, with the exception of the positions in the guards which you allude to; and also in the ordnance corps it was acknowledged, and understood by the army, that that rank carried with it the position of colonel.

336. (*Gen. Sir G. Brown.*) Might I ask your Royal Highness whether the lieutenant-colonels existing in 1854 would not have had all their interests protected by being put in the same category, that is to say, by promoting them all, without reference to command or otherwise, at the end of three years in the rank of lieutenant-colonel?—No, I think not, because I consider that, though there may have been a great many in that rank who had only recently become lieutenant-colonels, yet I think it was their inherent right not to be superseded as lieutenant-colonels, they being already lieutenant-colonels at the time of the warrant, and therefore I consider that that accidental advantage was legitimately their due; and that applying the three years' rule to them would have been an injustice to them.

337. Those who had commanded regiments obtained their promotion at the end of three years' service, but those who were not employed remained out of the promotion for three or four years I think?—I think

*H.R.H. the Duke of Cambridge.*

18 May 1863.

the true rule was to promote every officer who had the rank of lieutenant-colonel up to the date of that warrant coming out; from that time the matter takes a new start, and then you could apply any rule you liked, but up to that period they had a real right and a vested interest in not being superseded; I do not consider that we had a right to supersede anybody.

338. (*Mr. Bouverie.*) Was your Royal Highness chairman of the Commission of 1858?—No; Lord Herbert was chairman. I was a member of the Commission.

339. Was the case of those officers who had been promoted in the interim in consequence of distinguished service, or from any other reason, duly considered by that Commission?—I consider that it was. It will appear so by referring merely to the evidence of General Lindsay, which I have already alluded to. Will you observe question 31, which I will read, of General Lindsay's evidence, "*pro tanto* "that increase of the full-pay retirement was an "advantage, not only to the men who took it but to "those below them who did not take it?" At the end of question 31 General Lindsay answers that "in "the same position in which he formerly was there "are 21 officers who had been promoted for distin- "guished service in the field who have been passed "over." That is the first allusion. Then, again, to question 71 this answer is given—the question put was "Do you consider that by that arrangement you "will get all those officers to stand in the same rela- "tion to one another just as if the warrant had never "been in operation." The answer is, "No doubt of "it. But there is one class of officers who intersect "them, and those are officers who have been pro- "moted for distinguished service, and they will "occasionally intersect their dates." Again, in No. 74 the question is put, "But if an officer being a "lieutenant-colonel is promoted to colonel for dis- "tinguished conduct in the field, he would not carry "anybody up with him, would you not consider "that an exceptional case?—Yes, in this way, if "what we are calling justice was given to those "officers who are passed over, they would have been "promoted to colonel before the officers who were "promoted for distinguished conduct in the field, "and therefore they would be above them. In that "way the officers who are promoted from lieutenant- "colonel to colonel will be affected, and in no other "way."

Appendix, page 62.

Appendix, page 63.

340. (*Gen. Sir G. Brown.*) That would imply that it had been considered by the Commissioners, certainly, would it not?—Yes, that is so. Again, in No. 75, I asked the question, "You would "make an exception for distinguished conduct?— "Yes, but I wish to be understood when I say an "exception in favour of distinguished conduct. They "would fall into their places according to the altera- "tion of the dates of others," clearly proving that the subject was brought under our notice.

Appendix, page 64.

341. If the three years' rule had been applied they would have fallen into their places all the same?—Yes. In question 76 the Chairman asks, "You want to "make a retrospective correction of the list before "you will deal with those officers as to distinguished "conduct?—Yes, but I would not alter the date of a "single man who had been promoted for distin- "guished conduct in the field." Question 77 is, "You would not apply your rule as to moving those "men up to cases where officers were promoted for "distinguished conduct in the field?—Certainly not." So I think I am justified in saying that this question was brought to the notice of the Commissioners of 1858. In explanation of Sir James Scarlett's evidence I would remark that Sir James Scarlett was not present on that day, and therefore his stating that he did not know it of course goes for nothing, because it is the business of every member of the Commission to read the evidence given when he was not present; his stating, as he did before Sir Charles Yorke's committee, that he did not know that it was brought forward, I venture to say is hardly justified in consequence of what I have now brought before the notice of the Commission.

Appendix, page 61.

342. (*Gen. Sir G. Brown.*) Is your Royal Highness of opinion that this Commission ought to make any distinction, in disposing of their case, between the Queen's aides-de-camp and the class of officers who were promoted merely for distinguished conduct in the field?—Not with reference to the colonels made by the correction of 1858, certainly not.

343. Is your Royal Highness of opinion that we ought to make any distinction, in disposing of the case of the officers, between the aides-de-camp and the distinguished service officers?—No

344. There ought to be no distinction?—None at all.

345. (*Chairman.*) There was a distinction previously to 1854, was there not?—Certainly.

346. Between officers appointed Queen's aides-de-camp and distinguished-service officers, in fact there was no such power to promote lieutenant-colonels for distinguished service before that?—Exactly.

347. Therefore the lieutenant-colonels would have been liable to have been superseded by anybody appointed a Queen's aide-de-camp, but not by anyone else?—Certainly.

348. None of these officers ought to be placed higher on the list, in your Royal Highness's opinion?—No, because my principle is that in equity there never has been any supercession, whether by distinguished-service colonels or by colonels made Queen's aides-de-camp, because I consider that the warrant made in 1858 was a correction, and not a new system. I think that what took place in 1858 ought to have been done in 1854, and that therefore those officers, though apparently standing higher in the list than some others, in equity never did so stand, because I consider the same thing ought to have been done in 1854 which was done in 1858.

349. The recommendation of the Commission of 1854 was that the vested rights should be protected?—Exactly.

350. Those lieutenant-colonels had no right to be protected against the appointment of Queen's aides-de-camp, had they?—No; but the other officers were not appointed Queen's aides-de-camp till after the injustice had been done to them. I consider that injustice was done to those lieutenant-colonels in 1854, the distinguished-service officers were not promoted till 1855. The consequence was, that when the injustice was done to those officers, the distinguished-service colonels and the aides-de-camp had not been promoted, and therefore in equity I say they never superseded the others.

351. In order to explain the circumstances with regard to the letter which your Royal Highness has pointed out as having been written by my instructions, and the reference that was made to me, I would ask, although it is perfectly evident, from what you have read, that the cases of those officers were brought before the notice of the Royal Commission during the course of the evidence that was taken, there was no direct application, I think, from those officers to be heard before that Commission?—I do not recollect any. What I implied when I answered that it was known to the Commission was on the ground that the evidence of General Lindsay, or a certain part of it, bore upon the question, but I did not mean that there was any specific reclamation made by those officers; at least I do not recollect it, and we have no papers to show it.

352. Supposing they had made an application to your Royal Highness to be heard before that Commission, their case would have been referred, during the time the Commission was sitting, to that Commission?—Certainly; I, as one of the Commission, would have encouraged it instead of discouraging it, and I presume that the others would have done the same.

353. Therefore am I correct in saying that, although the subject was thus incidentally alluded to in the course of the examination, there was no direct application on the part of those officers?—Certainly not.

354. (*Mr. Bouverie.*) If the application of these 21 officers was complied with, I suppose the request could only be met by antedating their commissions so as to put them over the heads of the officers who are now over their heads?—That is the only way I can see of doing it. The result of the proposal made by the Treasury and War Office really involved making four officers among those who had been antedated, colonels, when they were lieutenant-colonels, majors, and captains. I thought that an extraordinary anomaly which of itself ought to show how unfairly the proposed change would have acted.

355. The remedy of 1858 was a remedy which operated by ante-dating the commissions of those officers who were passed over by the warrant of 1854, was it not?—Yes; they were all made colonels.

356. Are you aware whether antedating, to such an extent at least, had been resorted to in the army before?—I am not aware of it. I have not asked that question nor have I searched into the precedents, therefore I could not say, but I think not.

357. Therefore it was an anomalous proceeding?—It was.

358. Resorted to in consequence of the peculiar grievance of those officers?—It was.

359. Again, to antedate the commissions of a number of officers would be another anomalous proceeding in the army?—I think it would be much more anomalous to antedate the commissions of officers of a much junior rank; all the colonels, whose commissions were antedated by the warrant of 1858, were officers having the rank of lieutenant-colonel up to a certain date; but this proposal would antedate to the extent of three steps, for some men were captains at that time, and you would ante-date them to be colonels instead of being captains.

360. Your Royal Highness is then of opinion that antedating would be a very objectionable practice to introduce?—Most objectionable; I cannot conceive anything more objectionable.

361. (*Chairman.*) The antedating by the warrant of 1858 was an unprecedented act to meet an unprecedented claim, was not that so?—Yes, just so, but I do not think that in any army in the world you would find that such a thing had happened as to antedate three steps at once, and that is what this would amount to in the case of four officers.

362. (*Maj.-Gen. Sandham.*) Would it be possible to antedate a Queen's aide-de-camp's date of commission?—It has never been done hitherto, because there has been no cause for it, but there would be no impediment, I suppose.

363. (*Gen. Sir G. Brown.*) Is it not the case that if the three years' rule had been applied to all lieutenant-colonels generally, in 1854, this question would never have arisen?—I should be very sorry to answer that question in the affirmative, because there is such a spirit of cavilling at any changes that are made, that I think, whatever had been done, somebody would have complained.

364. If those lieutenant-colonels had all been put up to the rank of colonel at the expiration of three years from the date of their lieutenant-colonelcies, the Queen's aides-de-camp and distinguished-service officers would have come in in their natural places according to the dates of their appointments, would they not?—How can you with justice apply one rule to men who were appointed under another rule?

365. If in 1858 you had given them all rank alike, would it not have been considered a very great boon?—I can only answer the question put to me by saying that my argument is simply this, that the officers of lieutenant-colonels rank, prior to the warrant of 1854, were entitled, by virtue of their position, to have no supercession, with the exception of the promotion of Queen's aide-de-camp, and officers in those positions in the guards and ordnance corps which were acknowledged to carry the rank of colonel; any supercession, other than that would, in my opinion, have been considered a grievance; and therefore I say that, although those officers may have benefitted, and some no doubt did greatly benefit, by being put up at once, they were entitled to be so put up rather than be superseded by anybody else.

366. The supercession by the distinguished-service officers was introduced by a new regulation, was it not?—Certainly.

367. And as regards the three years' service rule, protection was given?—I think there is no justice to the army in applying the three years' rule to get out of a difficulty which I admit exists, but which would not justify such an act.

368. (*Gen. Sir G. Brown.*) Putting the distinguished-service officers aside for a moment, and taking the 10 or a dozen Queen's aides-de-camp, suppose you had applied the three years' rule to the whole of the lieutenant-colonels, whether in the command of regiments or not, they could have had no grievance if they had got their rank at the end of the three years, could they?—I think they would have had a very great grievance.

369. Setting the distinguished-service officers aside, the Queen's aides-de-camp had a right to go over them, had they not?—I consider that any supercession would have been a great grievance, and applying the rule, with respect to the three years, to officers to whom that rule did not apply up to that time, would have been considered, and would have been, a great grievance to those officers.

370. (*Maj.-Gen. Russell.*) Would it not have been in contravention to clause 8 of the warrant, which says "that field officers commissioned as such before the 20th June 1854 be allowed to rise by brevet?"—Certainly, in every instance the Commission of 1854 admitted that no vested interests were to be dealt with by the warrant, as the Chairman has stated, but that was not completely carried out in the warrant, and consequently there was a necessity for the Commission of 1858 to correct the error of the Commission of 1854. I can only look on the Commission of 1858 as having done so.

371. (*Chairman.*) If in 1854 the whole of the lieutenant-colonels had been made colonels at that time, there would have been no hardship?—There would not have been any supercession; as I say, I admit, that in the *Army List* there is apparently a supercession, but I consider that in equity there never has been a supercession at all, because I consider that those lieutenant-colonels ought to have been put up in 1854 instead of being put up in 1858.

372. The power of rewarding for distinguished service is not limited to the position which the distinguished officers hold on the lists of colonels or major-generals. There is a power of selecting them by your Royal Highness, is there not—for instance, a distinguished-service colonel might be made a major-general, might he not?—Certainly; it is not confined to one rank.

373. I mean to say that the power of rewarding for distinguished service is not confined to the position on the list of colonels; you are not obliged to promote the senior colonel; you take them in reference to their service in fact?—Certainly.

374. You might take anyone on that list and make him a brigadier-general to-morrow?—Certainly.

375. Therefore the power of rewarding those officers is not limited by their position on the list?—No.

376. (*Mr. Bouverie.*) The staff appointments are really the prizes of the profession, are they not, particularly in that branch?—Certainly they are; it has no reference to their position on the list.

377. I will read through the names of the Queen's aides-de-camp; is Sir Thomas Troubridge on the staff?—Sir Thomas Troubridge is at the Horse Guards.

378. Colonel Griffith?—No, he is in command of a regiment.

379. Colonel Smith?—He was on the staff as assistant adjutant-general in Ireland; he gave it up.

380. (*Gen. Sir G. Brown.*) He got a regiment, did he not?—He was on the staff.

*H.R.H. the Duke of Cambridge.*

18 May 1863.

381. (*Mr. Bouverie.*) Colonel Percy Herbert is on the staff?—He is on the staff.

382. Colonel Dickson?—He was on the staff; having served the full period, he has now rejoined the regiment.

383. Colonel Norcott?—No.

384. Prince Edward of Saxe Weimar?—No, he is in the guards.

385. Colonel McMurdo?—He has a very good staff appointment.

386. Colonel Wetherall, is he on the staff?—He is on the staff.

387. Colonel Lake, is he?—Colonel Lake of the Indian service you refer to; he has a very good civil appointment; his case is a peculiar one; he was transferred, from a local regiment in the Indian service, to the line, for service during the Russian war.

388. For service at Kars?—Yes; besides being made a Queen's aide-de-camp, he has been largely rewarded for his services.

389. Has Colonel Gordon any staff appointment?—He was on the staff, and now commands the engineers at Portsmouth.

390. Colonel Chapman, is he on the staff?—He is on the staff.

391. Are any of those officers paid aides-de-camp?—Sir Thomas Troubridge is, I know. I think they are all paid. I could not say off-hand. Colonel Herbert is, I know.

392. (*Maj.-Gen. R. Rumley.*) Some have good-service pension, I believe?—Yes; I think I may be permitted to say here, what I am very anxious to say, that I hope the Commission will understand that the answers which I have given were given on principle; in fact, what Mr. Bouverie has just elicited proves that it must be on principle, for most of those officers are actually in staff appointments at the Horse Guards, therefore it is not to be supposed that I can have any feeling against those officers; the whole question, so far as I am concerned, is a question of principle as regards the army, and not with reference to any individual.

393. (*Mr. Bouverie.*) My question was addressed with regard to the question of personal hardship to those officers?—Yes.

His Royal Highness withdrew.

*Col. F. E. Chapman.*

Colonel Frederick E. Chapman, C.B., (*Deputy Adjutant General R. Eng.*), examined.

394. (*Chairman.*) I believe you have expressed a wish to be examined before this Commission?—No; I came here by special notice.

395. You are one of the officers who were promoted for distinguished service, are you not?—Yes, in 1855.

396. In the month of November 1855?—Yes; the 2d of November 1855.

397. Do you not wish to make any statement to the Commission?—No.

398. Previously to the year 1854, the promotion from the rank of lieutenant-colonel to that of colonel was strictly by seniority, with the exception of those officers whom the Sovereign might select as aides-de-camp, or certain ranks in the guards and ordnance corps which gave the rank of colonel, was not that the case?—I believe it was. I believe Her Majesty also had the power to promote officers for distinguished service in the field.

399. Can you point out any instance of an officer, having been appointed a colonel for distinguished service in the field, except as a Queen's aide-de-camp before 1854?—I am not prepared to say at present, for I have not looked into that question.

400. You will see that it is most important, because the question is, whether you were appointed to the rank of colonel under the warrant of 1854, which introduced a new regulation, or whether it had been the practice before that time to appoint officers for distinguished service without making them Queen's aides-de-camp?—I am not prepared to say.

401. There can be no doubt that there is a distinction between officers appointed as Queen's aides-de-camp and officers promoted for distinguished service; that is to say, nobody will doubt for a moment the prerogative of the Crown to appoint any officer whom Her Majesty may please as Queen's aide-de-camp, without giving any reason for the appointment?—Yes, there is no doubt about that.

402. And although on the appointment of a Queen's aide-de-camp no reason is attached to that promotion, yet on the appointment of a distinguished-service colonel it is mentioned that he is appointed for distinguished service?—Yes, I always understood that the power was the same in each case. I may say that the only complaint we have to make is, that after enjoying the rank of full colonel for three years as distinguished-service colonels, we found ourselves by the antedated brevet put down below 115 other officers.

403. You were affected by the warrant of 1858?—Yes.

404. And your application now is, with the other 20 officers, to be replaced nearly in the position you were in, but not altogether?—Excepting those that have qualified and been promoted by the three years' rule, we quite think it fair and right for those officers who have served three years to go over our heads, provided they come in at the right dates; but we cannot see the necessity for the regulation which there was in the warrant of 1858 for antedating the whole of those officers, and putting all of them over our heads.

405. You think that they were fully entitled to be protected against that clause in the new warrant which placed other officers over their heads for three years' service?—Yes, but we do not think that it ought to have been done to the injury of our own interests; we think that our interests ought to have been protected likewise.

406. You think that those officers ought to have been protected against the one clause introduced into the new warrant, and not against the other?—I did not look at it as a clause in the new warrant at all before you put it to me in that way.

407. The passage which I pointed out to you was not in the warrant, it was a recommendation of the Royal Commissioners. The objection, on the part of the other officers, was, that the warrant of 1854 did not carry out the recommendations of the Royal Commission?—Yes, exactly.

408. That is the view which the Royal Commission of 1858 appear to have adopted, for they replaced all those officers in the position which they would have occupied, supposing that the brevet of the 28th November 1854 had included the whole of the lieutenant-colonels at that time?—Yes; what we consider is that, having been promoted on the 2d of November 1855, our interests were not sufficiently protected when the warrant of 1858 came out.

409. Do you imagine that the position of this class of officers was not sufficiently brought before the attention of the Royal Commission of 1858?—I think it was not sufficiently considered.

410. Were you examined as a witness before that Commission?—I was not.

411. Were you, as a distinguished officer, represented in any way before that Commission of 1858?—I do not recollect, I was not much interested about it at that time.

412. (*Lieut.-Gen. the Earl of Rosslyn.*) If the warrant of 1858 had not had a retrospective effect what would your rank have been now—that is to say, if it had not given promotion to officers over whose

heads you had passed?—I should have had the last promotion to major-general.

413. The practical effect of that warrant upon yourself is, that instead of being a major-general now you are a colonel?—Yes.

414. (*Chairman.*) Were you a lieutenant-colonel previously to the 20th of June 1854?—No.

415. (*Maj.-Gen. Russell.*) Would not the protection which you think was not afforded to your interests have been an infringement of the rights of the field officers, commissioned as such before the 20th of June 1854, as described in clause 8 of the warrant of that year?—I do not see that it would, perhaps it is because I do not quite understand your question.

416. Those officers are to rise by brevet, are they not?—The lieutenant-colonels previously to the 20th of June 1854.

417. As I understand, you propose that they should rise after three years' service simply?—That is what a great number of them have done.

418. You would propose that those lieutenant-colonels, after completing three years' service, should all be promoted to the rank of colonel, thereby introducing you as a colonel before some of those who were antedated to the 28th of November 1854?—I think, if you look at the list, you will find several officers who were lieutenant-colonels previously to June 1854 who have qualified and been promoted under the three years' rule.

419. All who were lieutenant-colonels on or before the 20th of June 1854 were made full colonels by the rectification brevet in November 1858, and all with the same date, were they not?—Yes. I cannot see what necessity there was for promoting an officer who was a lieutenant-colonel on the 19th of June 1854 to be a full colonel of the date of the 28th of November 1854, that is to say, possibly within six months of his becoming a lieutenant-colonel, and he might be an officer who had gone on half-pay, or had been staying at home to suit his own convenience, while the officers promoted for service in the field had been working out all their time and had earned their promotion.

420. How do you propose to guarantee the rights under the 8th clause?—I would promote them all under the three years' clause.

421. That is applying the new rule to all, whereas the clause says only "to rise by brevet"?—Yes.

422. (*Chairman.*) Supposing in 1854, in order to carry out the recommendation of the Royal Commission, the whole of those officers had, on the 28th November 1854, been made colonels, it would have been no grievance to anyone, would it?—I cannot understand upon what grounds you would make them colonels six months after becoming lieutenant-colonels without having seen any service.

423. Upon this ground, that when they arrived at the rank of lieutenant-colonel, they did so with the perfect understanding that according to the rules of the service no other officer could be placed over their heads, except Queen's aides-de-camp and officers holding the positions in the guards, &c., which I have alluded to. In order to protect them from the introduction of the new rule, might they not have been made colonels?—Of course that would have been possible.

424. The only effect would have been to retain them in the same position as before; the mere being called colonels, instead of lieutenant-colonels, would secure to them no pay, it would only give them the relative position which they held, and no fixed period of service is required between the ranks of lieutenant-colonel and colonel; on the contrary, one of the rectifications was to date a great many officers' commissions as lieutenant-colonels one day and as colonels the next, therefore there was no time required by the rules of the service to intervene between the date of a lieutenant-colonelcy and of a colonelcy, was there?—If you throw aside the operation of the warrant of 1854, there was none until you substituted five years under the warrant of 1858.

425. But the Commission recommended that those officers should be protected against the operation of that new warrant, did they not?—Yes.

426. But the warrant did not bear out that recommendation?—It did not protect the other officers who, between 1854 and 1858, had become full colonels.

427. But the warrant of 1854 could not refer to officers who were not appointed till after that warrant came out?—No.

428. Therefore you say now that if anybody neglected their interests it must have been the warrant of 1858 and the Commissioners of 1858?—Yes.

429. As I am responsible for the warrant of 1858, I beg to point out to you that it is in strict conformity with the report of the Commission. The warrant of 1854 neglected the recommendations of the Commission in not protecting those officers, but the warrant of 1858 carries out strictly the recommendations of the report of the Royal Commission, and if any hardship has been inflicted upon those distinguished officers, it is by their being passed over by the Royal Commissioners, and not in consequence of the drawing out of the warrant?—I understand that; but it appeared to us that clause 57 (I think it was that clause), in the report of the Commissioners of 1858, had not been embodied in the report. I may say that I am told there was no instance in the peninsular war of a promotion from the rank of lieutenant-colonel to that of colonel similar to the promotion of distinguished-service colonels. You asked me a question upon that subject just now

430. (*Maj.-Gen. Rumley.*) Now that you are aware of that difference in the positions of the Queen's aides-de-camp and the distinguished-service colonels, what is your opinion upon the claims of these officers?—I still think that the officers promoted in 1855 for distinguished service should not have officers put over them by an antedated brevet, men a great many of whom were at home on half-pay and who had not served their three years.

431. (*Chairman.*) Were not you placed over their heads by a subsequent rule which was not in operation when they were made lieutenant-colonels?—Most certainly I was.

432. (*Mr. Bouverie.*) If it had been reversed, if you had been a lieutenant-colonel in 1853, and had had a claim to promotion by seniority only, without reference to distinguished service, and if a subsequent change had been made, so as to give promotion for distinguished service, should you not have thought yourself aggrieved if officers had been promoted for distinguished service over your head?—I suppose I should; but take the present case, if any officer was promoted over my head at the present moment for distinguished service, I should not object to that at all. If the colonel below me was made a major-general for distinguished service to-morrow I should not object to it.

433. Could he be so promoted?—Yes.

434. He must be made a brigadier, must he not?—No, there were several promoted for distinguished service at the end of the last war.

435. You were appointed, subject to the warrant of 1854, and that was a portion of it, but a major-general could not have been placed over the heads of those officers who were colonels previously to the warrant of 1854, without theirs being protected, and many colonels were made supernumerary major-generals in order to protect them?—Yes.

436. There is a distinction between those who were colonels in the early part of 1854 and those who were made colonels subsequent to the warrant of 1854, because they were evidently subject to the provisions of that warrant, and it was notified to everybody on the 20th of June 1854, that all the appointments would be subject to that warrant?—All the major-generals promoted for distinguished service after the late war were made so under the warrant of 1854, although they were made supernumeraries.

437. The major-generals who were made supernumeraries did not come into their places, did they?—They received the date of their commissions from the time when they were first made supernumeraries.

*Col. F. E. Chapman.*

18 May 1863.

438. The supernumeraries have ceased now?—Yes, I believe so.

439. The system was only intended to preserve the rights of those who were colonels previously to the warrant of 1854?—Yes.

440. Was not it the fact that a supernumerary number of major-generals was granted in order to protect those who were colonels previously to the warrant of 1854?—Yes, but they went over the heads of those officers. They took the dates of their commissions as supernumerary generals. There is no protection, so far as I can make out, because a junior goes over the heads of all his seniors.

441. Those officers who were colonels then became major-generals as soon as they would have done originally, did they not?—Exactly, but they had men put over their heads as supernumeraries who remain senior to them as major-generals.

442. They were senior to them in point of rank as major-generals, were they not?—No.

443. They did not lose a step?—Yes.

444. All those colonels who were appointed subsequently to the warrant of 1854 were appointed subject to that warrant, and there was no protection to them?—I think so. The difference is because you have a fixed number of general officers, and it is only respecting the rights of all the officers in that number, if you make a batch of major-generals for service in the field, that they should be made supernumeraries. It protects their rights as to the number, but not as to the date of their commissions, and it would make a difference as to promotion to the rank of lieutenant-general afterwards.

445. Then on your being made a colonel their rights were not protected, because there was no supernumerary list; you would have gone up before those colonels over whose heads you were appointed, they would not have been protected in any way?—No.

446. The colonels were protected as far as their pecuniary interests were concerned; they would be major-generals just as soon as before?—Yes; there was the same number above them, irrespectively of those promoted for service.

447. (*Maj.-Gen. Russell.*) If the lieutenant-colonels, whose commissions were dated prior to June 1854, had originally been promoted, in the general brevet, issued consequent upon the promulgation of the warrant of 1854, would you have been satisfied with your promotion and the position you had attained as junior to them?—I must have been, because I should not have been promoted to be a full colonel until after those officers were made brevet colonels.

448. Your dissatisfaction, then, is entirely caused by having for some time appeared in the *Army List* as senior to those officers?—Not altogether. I consider that the warrant of 1854 established the promotion of lieutenant-colonels to full colonels for distinguished service in the field, but in the revision of that warrant in 1858 I consider that protection should have been afforded to the officers who were promoted for distinguished service in the field; their interests should have been protected by the provisions of the warrant of 1858. You accept that portion of the warrant of 1854 which provides for the promotion of lieutenant-colonels and colonels for distinguished service in the field, but afterwards, by the warrant of 1858, you overthrow the whole of the first part of the warrant, that is, with reference to the three years' service; you accept one part of the warrant and refuse the other; in revising the portion of the warrant with regard to the three years' service officers, you do an injury to those promoted under another clause of the warrant, viz., the distinguished-service officers.

449. Then you do not consider the clause 14 of the warrant of 1858 as remedying an injustice done to these officers?—It is that very clause to which we object.

450. You do not admit that any injustice had been done to the lieutenant-colonels previous to 1854 by the clause 8 of the warrant of 6th October not being acted upon in their case, namely, a general brevet; it states there that they should be allowed to rise by brevet?—You must read a little further than that, "be allowed to rise by brevet, as under the regulations then in force;" (but that was set aside, and it goes on to say:) "but no officer, promoted to the rank of field officer on or after that date, is to rise from the rank of lieutenant-colonel to that of colonel otherwise than by three years' service in the former rank."

451. I only refer to those who were field officers, lieutenant-colonels in fact, previously to 20th June 1854?—What appears to me is this, that in remedying clause 8 of 1854 by clause 14 of 1858, you did an injury to the officers promoted for distinguished service who had been promoted under the warrant of 1854.

452. Had no injury been done to the other officers which called for redress?—Why should you injure one set to right another?

453. I do not admit that one set was injured?—The very thing that is complained of is the injury caused by the second warrant.

454. I am assuming that those officers in 1858 only received what they ought to have had in 1854?—I cannot quite agree with your view.

455. (*Mr. Bouverie.*) Do you concur in the suggestions made by General Lindsay?—Yes; I concur in the suggestion which was read out just now by his Royal Highness the Duke of Cambridge.

456. That you should stand on the list according to the dates you would have held with the three years' service?—Yes, that we should be placed according to the dates we should have held with the three years' service officers.

457. (*Lieut.-Gen. the Earl of Rosslyn.*) You complain, do you not, that the vested interests, created between 1854 and 1858, were not protected?—The vested interests which were created by clause 8 in the warrant of 1854 were not protected by the clause of 1858.

458. (*Chairman.*) The other officers complain that previously to 1858 they were not protected by the warrant of 1854?—Yes.

459. That is exactly the position of affairs?—Yes, it is, and we consider that in revising the warrant of 1854 we were, to a certain extent, overlooked; there was a great deal of evidence given by Col. Lindsay before the Commission, which his Royal Highness read out just now, the recommendations of which were good, but were not acted upon.

460. I think his Royal Highness only read that to prove that it had been brought before the Commissioners?—Yes; under question 75, in answer to a question by the Duke of Cambridge, General Lindsay says, "I wish to be understood when I say an exception in favour of distinguished conduct. They would fall into their places according to the alteration of the dates of others;" that is, assuming that the three years' clause was carried throughout the whole of the promotions.

461. (*Maj.-Gen. Rumley.*) In the corps of royal engineers how are officers appointed colonels commandant?—They are appointed by seniority on the list of general officers.

462. By succession?—According to the dates of their commissions as major-generals.

463. By succession and not by selection then?—Yes, by succession.

464. By seniority?—Yes, in their army rank.

465. (*Maj.-Gen. Sandham.*) Is that without reference to service in the field?—We have had no case at present of selection; the last promotion was the recent one of General Walpole, which was taken on army rank.

466. From his first brevet rank?—Yes, dating as far back as a major.

467. In the case of General Forster was not that the case?—He was a Queen's aide-de-camp, and his promotion to major-general was consequent on the date of his commission as colonel and aide-de-camp, and he passed over three or four other officers.

The witness withdrew.

Brigadier-General JOHN ST. GEORGE, C.B., R.Art, (*President of the Ordnance Select Committee*), examined.

*Brig.-Gen. J. St. George.*

18 May 1863.

468. (*Chairman.*) I believe you are one of the distinguished-service colonels whose cases are before us?—Yes.

469. Do you occupy exactly the same position as Colonel Chapman?—Yes, in that respect.

470. Are you aware of any instance of any officer having been appointed a colonel for distinguished service in the field, except as a Queen's aide-de-camp, before 1854?—No; I am not aware of any, and I never thought of looking for precedents.

471. Do you consider that you were promoted under the warrant of 1854, or that you were promoted according to a regulation that had been in practice before?—I should have thought that I was promoted according to a regulation which had always existed. I considered that the power of the Sovereign was not limited in matters of promotion.

472. Will you have the kindness to state anything you wish to bring before us?—I have rather separated my case from that of others; and I have not inquired much into the general subject; About 12 months ago I wrote a letter to the Under Secretary of State for War which contains nearly all I have to say upon the matter, and probably therefore I may be allowed to read extracts from it; it was dated 29th April 1862. "I am one of the 23 colonels who were supposed to "have received a step of rank for the Crimean war, "and I have hitherto refrained from intruding my par- "ticular case before authority, knowing that the gene- "ral subject was under consideration, and feeling sure "that there was every wish to do justice to all parties; "but as almost seven years have now elapsed, and as I "hear there are difficulties in the way of a general "readjustment which are considered almost insur- "mountable, I venture to separate my claim from that "of others, and to submit it altogether upon its own "merits. The letter of the Military Secretary of the "26th September 1859, written by the Commander- "in-Chief's directions, and addressed to yourself, says, "in reference to some of these lieutenant-colonels "(I being one of the number), that 'being full "'colonels previous to the war they could have "'obtained no further promotion, unless their ser- "'vices should have been of that distinguished "'character which would have justified their advance- "'ment to the rank of major-general from a very "'low position on the list of colonels.' I beg leave "to submit that my services were of that character "which might fairly justify me in expecting advance- "ment to such rank. I leave their value with full "confidence to the judgment of his Royal Highness "the Commander-in-Chief, and I have only to state "that the extent and responsibility of the command "I exercised for about seven months, and the "immense importance of its duties, were such as "should properly have been performed by a general "officer. I commanded the siege train of the "British army at the fall of Sebastopol. I had "under any exclusive command 29 companies of the "Royal Artillery, numbering between 3 and 4 thou- "sand men, and a detachment (under Colonel "Alexander, C. B.) of the Royal Marine Artillery, "while Captain Sir H. Keppell, commanding the "Naval Brigade received instructions from, and "made daily reports to me; and though I refrained "from any unnecessary interference in his case, "he had the courtesy to call upon me on appoint- "ment, and to assure me that he considered himself "under my orders. I had 200 heavy guns and "mortars in position, and all the materiel of the "siege under my direction. After the fall of "Sebastopol, I was recommended for promotion, and "my name was sent from the Horse Guards to the "Secretary for War, on the 16th October, 1855, for "submission, among others, to Her Majesty, for the "honour of Knight Commander of the Bath. I was not "promoted except to a rank which it appears I was "already in possession of, and the Secretary of State "submitted my name to Her Majesty for the 3d class "of the Bath instead of the 2d. The artillery officer "who held the same position as I did in the French "army, and commanded the artillery of the siege, was "a lieutenant-general, and the officer commanding the "British naval brigade in the trenches, who was at "least in some degree under the officer commanding "the siege train, always held the rank, and received "the allowance, of a brigadier-general; and I therefore "trust it will not appear presumptuous that, as I per- "formed the duties, I aspire to the rank of major- "general." My application was unsuccessful; but His Royal Highness conferred on me the temporary rank of brigadier-general.

473. I understand that the object of your reading that letter to the Commission was to show that you conceive that you would have had a claim for promotion on account of the distinguished character of your services?—On account of the extent of my command.

474. You consider that the position in which you were placed and the services in which you were employed were of such a character as would have justified your having an aide-de-campship or a major-generalship?—Yes, a major-generalship; I was a full colonel when I performed the services and was recommended for promotion, and, as I performed services which were those of a general officer, I considered that I should have been made one. I consider that it is admitted by Sir Charles Yorke in that letter that I had that claim.

475. By the warrant of 1854 was it not in the power of the Commander-in-Chief to have made you a major-general?—Several other colonels were made major-generals.

476. That power still exists, does it not?—I suppose so.

477. The claim is a claim to be considered, not by this Commission, but by the proper authorities?—I understood that this Commission was to consider the case of each officer who felt he was injured by the operation of the warrant of 1858.

478. Although the claim you put forward may be a very proper claim for consideration by the proper authorities, it is not a claim of the nature of those submitted to us?—No, and that rather explains why I have not entered into the subject which has been entered upon by General Lindsay and others. However in case my claim to be made a major-general is not entertained, then, as colonel, I claim to stand above Colonel Shuttleworth, because he did not complete three years' service as a lieutenant-colonel till the 7th of December 1855, whereas I was specially promoted over him on the 2d of November of that year. He has no claim to be a colonel of the 28th November 1854, but was only made such by the antedated brevet, which was acknowledged to be an oversight as regards the special promotions of 1855 by Lord Herbert, Sir F. Williams, Sir F. Smith, and Sir J. Scarlett, all members of the Commission of 1858.

479. How is your statement proved with regard to that, Sir James Scarlett and the others, because it would appear that Sir James Scarlett was not present that 'day?—It is in Sir James Scarlett's evidence; his words are "I do not remember their being dis- "cussed that day."

480. (*Maj.-Gen. Rumley.*) The only direct evidence is that of Sir James Scarlett?—I will make inquiries and shall be able to refer you to the authority for the assertions that I have made with regard to Lord Herbert, Sir F. Williams, Sir F. Smith, and Sir James Scarlett, all having been members of that Commission, and having acknowledged that it was an oversight.

481. (*Chairman.*) The committee go further than that, because they say they are of opinion that they ought to be replaced? He says, "This position on "the list was entirely overlooked, and their case was "not considered in the decision upon which the report

*Brig.-Gen. J. St. George.*

18 May 1863.

" was founded, but that since his attention was drawn " to it he had given the subject much consideration, " and recommended that they should be replaced."

482. (*Mr. Bouverie.*) You are quoting General Lindsay's evidence, are you not?—Yes.

483. (*Chairman.*) The first application of the distinguished-service officers, after the report of the Commission of 1858, was made to me, I think, and we have had before us the answer that his Royal Highness gave to it. When was the next application made, that would be made to Lord Herbert, who was then Secretary of State for War?—I believe so. I will continue. If those colonels whose commissions as lieutenant-colonels were dated before the 17th February 1854 should object to my going over their heads on the ground that the 13th clause of the warrant of 1854 was a new rule, and equally opposed to their vested rights as the new three years' clause, still I claim the same consideration as the major-generals promoted by selection, who, when the colonels at the top of the list complained of being passed over, were made supernumerary major-generals, the public paying the extra expense incurred beyond that of the fixed establishment of major-generals. Unless this is done I am deprived entirely of my special promotion, because the authorities by an oversight promoted me under a new rule, which three years afterwards they found to be unjust to others; the intention of the Crown was to reward; if that intention is worthy of consideration, I have a right to claim the reward in some shape; and if it had been believed at the time that any doubt could have been thrown on the effect of the method adopted, I and others would have been made Queen's aides-de-camp, I suppose.

484. Then you admit that if those officers had all been made colonels in 1854, you would have had no right to complain because you had not been promoted at that time?—Not unless the authorities had sent in my name for promotion, and the Queen had directed that I should be promoted.

485. Previously to 1854?—No, in 1855.

486. My question is, if the general brevet, which came out on the 20th of June 1854, had included all the lieutenant-colonels that existed at that time, would you have had any right to complain because you had not been promoted then?—It would have taken me in also. I was one of them.

487. Then, the warrant of 1858 did replace you in your position?—It took me in, but I was in 1854 a full colonel in reality, though I did not know it at the time; that is the argument that I hold, namely, that being a full colonel, in point of fact, at the time of the Crimean war, I could not have got any promotion except that of major-general.

488. (*Mr. Bouverie.*) If the warrant of 1858 had taken effect in 1854 you would have been a full colonel, would you not?—Yes.

489. And then you would have been entitled to be promoted as a major-general?—Yes, if promoted at all.

490. That is a different point altogether?—That is my point, I am lieutenant-colonel of the 17th of February 1854, therefore of course I should have been a full colonel by this warrant of October 1854.

491. (*Lieut.-Gen. the Earl of Rosslyn.*) You would have got nothing more for distinguished service?—Not in the least; I am just in the same position as regards promotion, as if I had stayed at home. I wish to impress upon the Commission that I performed services which I think appear on the face of them to entitle me to expect a step of rank.

492. If you had been a colonel in 1854 you would have been made a major-general?—I suppose so.

493. (*Mr. Bouverie.*) On account of the position you occupied?—Yes.

494. (*Chairman.*) Suppose all the lieutenant-colonels had been made full colonels in 1854, and you amongst the rest, any officers who were made Queen's aides-de-camp subsequently to that would have had no right to complain of you and the others being over their heads, because you were over their heads previously?—None.

495. They say that in that case they do not get any reward by it. Do they not get a reward compared with all those who are serving in the same rank at that time; for instance, if a man is made a Queen's aide-de camp he would go over the heads of all the existing lieutenant-colonels, though he might be junior to many of them?—To be made a full colonel, certainly.

496. Supposing all the lieutenant-colonels up to June 1854 had been made full colonels in 1854, then, as I understand the case which is put, it is that these officers get no benefit whatever from having been made distinguished-service colonels or Queen's aides-de-camp. You get no benefit with regard to the former lieutenant-colonels, but you do with regard to those serving as lieutenant-colonels at that time, do you not?—I do not know the position of the *Army List*, but there would be very few to get over.

497. I speak of the general principle, without reference to individuals?—They would have passed over the heads of those officers who were not lieutenant-colonels before the 20th of June 1854.

498. They would have had all the advantages of the new warrant, commencing from a certain time, namely, the 20th of June 1854?—Yes, but my own case is different, because I was one of those officers.

499. Your case is a special one, for the consideration, not of these Royal Commissioners, but of those who have the power of rectifying it?—Perhaps so.

500. Your complaint is, "If you had done in 1854 " what you did in 1858, I must have been a major- " general by this time"?—Yes, as I assume I should still have been recommended for promotion at the end of the siege of Sebastopol.

501. Your complaint is, "You have kept me in the " position of lieutenant-colonel till 1858, and you did " not rectify it till too late to do me any service?"—Yes; the answer of his Royal Highness to my letter was that he regretted he could not entertain my claim at this remote period for the rank of major-general.

502. (*Maj.-Gen. Russell.*) With reference to your statement in which you say, "I claim the same con- " sideration as the major-generals promoted by " selection, who, when the colonels at the top of the " list complained of being passed over, were made " supernumerary major-generals," is not there this difference, that the list of general officers is limited in number, whereas that of the colonels is unlimited?—Of course that is the case.

503. That makes an essential difference, the one being a fixed establishment, and the other not?—Yes, but I don't see how that difference effects the claim I have put forward.

504. (*Chairman.*) But in fact the colonels were protected, in a pecuniary point of view at all events, from the effects of the new warrant of 1854 by the appointment of supernumerary major-generals?—They might have been in a pecuniary point of view, but I believe what an officer looks forward to is promotion, and his position in the army; and at any rate these officers are put over their heads, as I claim to be put over the heads of certain other officers.

505. Even as far as steps were concerned, they obtained the step of major-general as soon as they would have done otherwise, did they not?—Just as soon, but eight or ten officers were put over their heads, who wlil stop them in their attainment of the next rank of lieutenant-general, and will be made before them.

506. (*Maj.-Gen. Rumley.*) How are officers appointed colonels-commandant in the Royal artillery?—Generally by seniority in army rank.

507. (*Maj.-Gen. Sir W. Brereton.*) Always within the past six years?—Yes, I believe.

508. (*Chairman.*) It is a strict seniority promotion up to a certain point in the artillery, is it not?—The regimental promotion is strictly by seniority.

509. (*Maj.-Gen. Sir W. Brereton*). The giving of battalions is by army rank?—I believe there has been an exception to that lately.

510. There has been one exception—in the case of an officer who was not thought eligible *then* to be made commandant ?—That was the exception I referred to.

511. (*Maj.-Gen. Rumley.*) There is that difference then in the Royal engineers and the artillery, inasmuch as the colonels-commandant are appointed in those two corps by seniority, whereas in the line they are appointed by selection ?—The power of selection exists in the ordnance corps just as it does in the line.

*Brig.-Gen. J. St. George.*
18 May 1863.

The witness withdrew.

Colonel James W. Fitzmayer, C.B., R. Art., examined.

*Col. J. W. Fitzmayer.*

512. (*Chairman.*) We understand that you wish to be examined before this Commission ?—I wish to mention one fact stated in my note. I was promoted in November 1855 for services in the field. I found myself, in the year 1857, quartered with a colonel of engineers who had held a lucrative civil appointment during the time I was employed in the Crimea. I was about two years his senior ,and when the warrant of 1858 came out it made me nearly two years his junior; the only reason was that some four years before he had been promoted to the rank of lieutenant-colonel before the 20th of June 1854, I having been promoted on that date, and from that simple fact I lost the service of four years with reference to that officer.

513. Do you know the exact date of your commission of 1854 ?—Yes, I obtained two steps on the same day, it was the 20th of June 1854.

514. Then you would be one of those lieutenant-colonels whose vested interests were recommended by the Royal Commission of 1854 to be protected ?—No, I had no vested interests whatever. I was promoted on the 20th June 1854.

515. Do you not consider that the officers promoted to the rank of lieutenant-colonel before 20th June 1854 were only liable to be superseded in the rank of lieutenant-colonel by officers made Queen's aides-de-camp, or by officers holding certain positions in the Guards which give the rank of colonel ?—I never considered that there were any vested interests in the army as to promotion.

516. That was the custom at that time, however ?—There were several customs in my own corps which have been set aside since, it was the custom that no officer should go above a senior.

517. Previously to 1854, can you point out any instance of officers being appointed from the rank of lieutenant-colonel to colonel except in regular rotation, except the appointments of Queen's aides-de-camp and field officers in the household troops ?—No, I never heard of any. I don't know how it may have been in the Peninsula.

518. In the mean time you were a lieutenant-colonel of the 20th June 1854 ?—Yes.

519. When were you appointed a colonel for distinguished service ?—In November 1855.

520. You were then placed over the heads of a great many of those lieutenant-colonels, who I suppose were seniors to you in 1854 ?—Yes, and I gained regimentally by it.

521. In the *Army List* you were placed in a certain position by the warrant of 1854 ? —Yes, by promotion for services, undoubtedly.

522. And you remained in that position until the new warrant of 1858 came out ?—Yes I did, and to a partial extent afterwards.

523. That placed you, I suppose, at the bottom of the list of colonels of 1854, if your appointment was only on the 20th of June ?—It was the same day as the brevet of that year.

524. If you had been a lieutenant-colonel of the 19th of June, what would have been your position ?—If I had been a lieutenant-colonel of the 19th of June I hardly know where I should have been now. It was merely because the officer mentioned happened to be promoted a lieutenant-colonel a few days before I was (I believe it was only a week) that that officer became two years my senior by the warrant of 1858, or nearly so.

525. Supposing the warrant of 1854 had carried out the recommendation of the Royal Commission of 1854, and in order to protect the interests of the then lieutenant-colonels they had all been made colonels in 1854, you would have had no ground of complaint then, should you ?—I should have considered it a strange proceeding such a wholesale measure as that. It might have been reasonable to protect the officers who had no means of serving the three years in command to which the obtaining of the rank of lieutenant-colonel was limited, but I think no other officers had a right to any protection whatever ; any officer who had retired from any cause from the service, and could not possibly work out his three years in command, might have something to complain of, but I do not consider that anybody else had anything to complain of. At the utmost the lieutenant-colonels promoted to 20th June 1854 could only expect to be made colonels on the completion of three years service in the former rank, and if this had been done there could have been no cause of complaint anywhere.

526. If an officer was placed in a position in which he could not obtain his rank by the new warrant, but in which he would have obtained his rank according to the old custom, surely it was a hard case ?—If he had had the advantage of the three years clause in the new warrant from the date of his lieutenant-colonelcy, he would not have complained. He would then have attained the rank of full colonel much sooner than under the old system.

527. Still it could never have altered his position with regard to those senior to him, the merely making him a colonel in 1854 would not have altered his position at all, it is only calling him a colonel instead of a lieutenant-colonel ; he would have had no additional pay and no additional position ?— I am not aware that the position of colonel in the army gives any advantage as to pay.

528. I think you said you took a view of it regimentally ?—Not in the case mentioned with regard to the officer of the engineers, because we were in different corps. I could not understand why he became four years my senior for a transaction four years before that time — he had been promoted in 1854 and in 1858 he got four years' back rank.

529. In 1854 he was a lieutenant-colonel ?—Yes, before the 20th of June 1854, and he got four years' back rank four years afterwards, and was put over my head. He got the step of lieutenant-colonel and colonel in the same day. I complain of that.

530. Supposing there had been no warrant, this officer would have been senior to you when you met the first time, would he not ?—Only by a few weeks my senior.

531. Still he would have been your senior ?—Yes, certainly. I have not thought much of the matter, because I never took any active measure at all or endeavoured to exercise any pressure upon the government to get promotion. I have not given my mind to examine in detail what I may have suffered or gained by it. I merely wish to mention the fact I have done with regard to this subject, as an illustration : an officer who was quartered with me, and who, during the time I was in the Crimea held a lucrative civil appointment, nevertheless was put above me. There may have been other officers who may have suffered, and who, by the warrant of 1854, had reason to complain but I do not think he had, and, in fact, he admitted that to me when we talked it over ; he said he did not know why the change was made ; he did not seem to think he had any vested rights.

532. He was an engineer officer holding a civil position ?—At the time we met he was in command

*Col. J. W. Fitzmayer.*

18 May 1863.

of the Royal Engineers in Scotland, and I was in command of the Royal Artillery. He said he never could understand the cause of the change that occurred between us.

533. (*Gen. Sir G. Brown.*) Who was that officer?—Colonel Frome of the engineers; we were always very good friends.

534. (*Maj.-Gen. Sandham.*) He was in the colonies at the time, was he not?—He was in the colonies.

535. (*Maj.-Gen. Sir W. Brereton.*) The artillery officers are placed in this position, Colonel St. George, Colonel Ward, Sir David Wood, and Colonel Fitzmayer on the list of distinguished colonels of artillery, is not that correct?—Yes, we were all promoted together; we were the only artillery officers promoted at the time.

536. (*Chairman.*) Do you consider it detrimental to the public service that there should be uncertainty with regard to promotion and the permanence of the various ranks?—Every officer's promotion and position should be as secure as possible, but I consider the Government have an undoubted right to promote any officer they please, provided they have sufficient grounds as to his services and the nature of them for doing so. I should like to know the reasons why officers were put over my head, but if they were reasonable, I would be the last person to complain; in the case I have mentioned, the officer put over my head admitted that there was no reason, I therefore thought it rather hard, particularly as it was for a transaction four years before. I should not complain if an officer were put over me who had performed any distinguished service. I do not complain of Colonel Dickson's promotion, although the custom in our regiment was to look upon it that we should go by seniority.

537. He was placed over your head because previously to 1854 he had what was considered by the Commissioners of 1854 a vested right, was not that the case?—Not Colonel Dickson.

538. The other officer to whom you allude?—Yes, I suppose so, but he could not understand himself what the vested rights were which gave him two steps of promotion in the same day.

539. He was an engineer officer, I think you said?—Yes.

540. That is a strictly seniority service, is it not?—Both our corps are held to be so.

541. He would have been very much surprised if any officer of the Engineers had been put over his head, and you would have been very much surprised if an artillery officer had been put over your head?—I do not know. I think Colonel Dickson was put over my head for distinguished service; at this very moment I go over the heads of other officers by the warrant of 1858 in army rank.

542. Not in your regimental position?—They were regimentally senior to me.

543. They still continue regimentally senior to you, do they not?—Some of them became lieutenant-colonels the same day as I did. They are still regimentally senior, but the time will come when I shall go over their heads regimentally, such at least is the rule at present.

544. You would have been very much surprised if any officer had been placed over your head in the Artillery contrary to the custom that prevailed, would you not?—It was contrary to the custom if it comes to putting an officer over my head.

545. (*Gen. Sir George Brown.*) Both yourself and Colonel Dickson became lieutenant-colonels on the same day?—Yes; he is much junior to me regimentally.

546. (*Mr. Bouverie.*) Would you not have thought it rather hard that officers by any rule should have been promoted over your head?—Not for distinguished service in the field.

547. You have always supposed then that officers could be put over the heads of artillery colonels for distinguished service in the field?—Most decidedly. I should say it would be depriving the Government of a most important part of their authority if they could not place an officer over the heads of others for distinguished services.

548. (*Chairman.*) Can you mention an instance of an officer being promoted from the rank of lieutenant-colonel to that of colonel, for distinguished service in the field, without being made an aide-de-camp?—I only know that Colonel Dickson was put over my head.

549. Subsequently to the warrant of 1854?—No, without any warrant. Colonel Dickson was put over my head for distinguished service in the field. I never complained of it.

550. That was subsequently to 1854, was it not?—Yes.

551. I ask whether there was any instance of any officer being promoted from the rank of lieutenant-colonel to that of colonel, for distinguished service in the field, without being made an aide-de-camp?—I am not aware of it; it may have been the case in the Peninsula, I cannot say.

552. It was not the custom, whatever the rights of the Crown might be, to promote for distinguished service before 1854?—No; but I should not have made any complaint if an officer had been put over my head for distinguished service, and now I do not consider that I have a vested right in keeping my position where distinguished services are the fair grounds.

553. Do you not consider that you have a vested right in your position in the artillery?—I consider that nothing, but something very extraordinary would justify any act on the part of the Government, in putting an officer over my head, but I think if fair and sufficient reasons were given, I should not have any ground of complaint; if an officer distinguishes himself they cannot promote him without putting him over my head.

554. That is provided for under the warrant of 1854, is it not?—I think so. I think I have no individual right to be considered when the public service is concerned.

555. Do you not think, that when a new alteration, which is admitted to be an improvement, is introduced, it is desirable, if possible, to secure protection for all existing interests?—Yes, decidedly. I would make every officer secure in his position, if possible, but having reference to that question, if the Government feel justified in putting an officer over your head you may feel something with regard to it; you are very likely to do so, but you have no ground of complaint.

The witness withdrew.

*Col. J. Yorke.*

Colonel JOHN YORKE, C.B., Unatt., examined.

556. (*Chairman.*) I think you have expressed a wish to be examined before this Commission?—I wrote a letter to the military secretary, and I have written a memorandum which expresses all which I have not already said in my peculiar case; it contains all which has not appeared in the letter which I wrote a few months ago.

557. Will you read it?—"Sir,—I have been most "reluctant in defending my position in the *Army* "*List*, being unable to do so without personal refe- "rence to Sir Thomas Troubridge, which I much "regret, but our case was somewhat parallel, with "the exception that 277 lieutenant-colonels and up- "wards of 100 majors existed between us, just at the "time we were both rendered incapable of serving "in the field. Powerful influence, however, has now "been obtained in his favour, which is most detri- "mental to mine and others if not contradicted; I "trust this may plead as my excuse, and that I may "be permitted to represent my losses in contradis-

" tinction to his rewards. The former are as fol-
" lows: namely, the command of a cavalry regiment,
" in which I took the greatest pride, together with a
" large sum invested to obtain the same. 2d. Se-
" veral steps in the *Army List*, which the warrant of
" 1854 allowed me for a time. 3d. Subsequent
" loss of a staff appointment within the regulated
" period, with strong recommendations from the Se-
" cretary of State. 4th. Refusal of the Legion of
" Honour, though specially recommended for the
" same by the Commander-in-Chief; I am the only
" commanding officer undecorated with this insignia.
" 5th. Serious infirmity for life. I have no gains to
" balance against these losses, except a good-service
" pension, for which I am most truly grateful and
" content. It would be invidious for me to specify
" the rewards in possession of some who are now
" claimants for more, as they embrace rapid, re-
" peated, and gratuitous promotion, lucrative and
" permanent employments, special honours, &c., but
" as their interests have publicly been proclaimed
" (*as overlooked*), I humbly beg for similar conside-
" ration respecting mine."

558. You were a lieutenant-colonel of the 4th of February 1853, I believe?—Yes.

559. Previously to the sitting of the Royal Commission, and of course previously to the issue of the warrant of 1854?—Yes.

560. Did you consider as a lieutenant-colonel that you could only be superseded by officers who were appointed Queen's aides-de-camp, or by officers appointed as field officers of the guards?—Only by the Queen's aides-de-camp.

561. The rank of field officer in the guards has always carried with it the rank of colonel in the army, has it not?—I was not aware of it.

562. The power always existed, long before 1854, it was not a new power?—I have no doubt you are right.

563. You did not consider yourself liable to be superseded by anybody but those who, according to the rules of the service, would previously have been promoted over your head?—I certainly looked at the Queen's aides-de-camp as the only officers who could go over my head.

564. From time immemorial I believe certain positions in the guards have carried with them the rank of colonel?—Yes, I had overlooked this.

565. The report of the Royal Commission of 1854 recommended that your vested rights should be protected, and you had every reason to expect that they would be protected, against any new clauses introduced into the warrant which did not exist at the time you became a lieutenant-colonel?—Certainly.

566. Unfortunately the warrant of 1854 did not carry out the recommendations of the Commission of 1854, and you were passed over between 1854 and 1858?—I was passed over by a great many, and I went over a few.

567. Did you remain in the command of your regiment for the requisite length of time?—Yes.

568. At the end of the three years' service did you become a full colonel?—Yes, at the end of three years' service I became full colonel.

569. (*Mr. Bouverie.*) You became a colonel by virtue of the three years' service warrant?—Yes.

570. (*Chairman.*) When the warrant of 1858 came out, you were replaced exactly in the position you occupied in 1853, with regard to these officers, were you not?—Yes, just in the same position as regards officers of the line.

571. It would have been exactly the same if the general brevet, which took place on the 20th of June 1854, had gone down to the junior lieutenant-colonel of that time and taken them all in?—Yes.

572. Now those distinguished officers claim to be replaced in the position in which they stood between 1854 and 1858?—Yes.

573. And to that you object?—Yes.

574. That is the ground of your complaint?—Yes. I wrote a memorandum which embraces my particular case. I was too ill to receive my medal. I was superseded by Sir Thomas Troubridge.

575. You were wounded on the 25th of October?—It was in the Balaklava charge.

576. (*Mr. Bouverie.*) You received your medal from the Queen in person, did you not?—No, I was too ill. I received the same invitation to attend; I was too ill to attend, and I was superseded, and from that unlucky circumstance I was superseded during the whole war. I have written a short memorandum upon the subject. I believe the cause of my being superseded in the first instance was purely accidental; the same kind feeling was intended for me as well as others, but I was in a dangerous condition on the 18th of May 1855, and totally unable to respond to the commands of Her Majesty to receive my medal at her hands; I had therefore the mortification of being superseded on that day by Sir Thomas Troubridge, and hence followed my supercession during the entire war. Had I been present on that occasion, I have reason to suppose I should have been similarly rewarded, but singular misfortune then intercepted my prospects; I had to submit to 17 surgical operations in rapid succession, which frequently endangered my life, and placed me out of sight, and consequently out of mind, for nearly two years, during which period I was repeatedly superseded; the ninth year is now advancing, and I am again threatened with the same penalty (which I think is unmerited). I am naturally most anxious for promotion, having gained none by the war, but on the contrary I have suffered losses, and am debarred from general employment through the severity of my wounds. I have here a document in proof that Her Majesty was not unmindful of my sufferings, also that the adjutant-general was pleased to convey to me the Commander-in-Chief's approbation as to the state of my regiment during the first year of my command.

577. (*Chairman.*) You are the senior colonel of 1856, are you not?—I am put down there as the senior colonel I think. On the last list there were one or two of that date senior to me, but this list puts me at the head.

578. You obtained that rank by having completed three years' service, did you not?—Yes.

579. Is that the position which you hold now subsequently to the warrant of 1858, which put you back again?—No; Colonel George who appears below me here is now above me; it is a singular case, we were both lieutenant-colonels of the same day.

580. (*Maj.-Gen. Sir W. Brereton.*) What day was that?—The 4th of February 1853; his majority was earlier than mine, and when the matters were reversed in 1858 he got a step over me.

581. (*Mr. Bouverie.*) On that account?—Yes.

582. (*Lieut.-Gen. the Earl of Rosslyn.*) You stand in the *Army List* as a colonel of 1854, I believe?—Yes; in 1854 he was, I suppose, senior to me, but in 1856 I was senior to him, because I had completed the three years' service.

583. In 1854, though both commissions were dated the same day, he was senior to you?—Yes, the next in seniority above me.

584. And then when the warrant framed upon the recommendation of the Commission of 1858 came out, you were put in the same position as you had been in formerly, were not you?—Yes, I suppose so, as regards officers of the line.

585. Was it a brevet rank of lieutenant-colonel that you had in 1853?—No, I purchased the regiment.

586. What was it in Colonel George's case?—He was the deputy adjutant-general in Jamaica, so I am just told.

587. (*Chairman.*) The commissions were both the same date?—Yes.

588. And would be gazetted according to who was the senior major?—Yes.

589. The date of your lieutenant-colonelcy was in 1853?—Yes, the 4th of February 1853.

*. Yorke.*
*ay 1863.*

590. After the warrant of 1854 came out you went over his head as soon as you had completed the three years' service, was that not so?—Yes.

591. And then after 1858 he was placed back again over your head?—Yes, which was quite just.

592. (*Mr. Bouverie.*) If I rightly understand you, you consider it a great grievance that those officers should be put back again into their positions over you in consequence of their promotion for distinguished service?—Certainly.

593. (*Chairman.*) At the same time admitting that you were always liable to be superseded by Queen's aides-de-camp?—Yes; but I look for protection to the antedate, otherwise the warrant of 1854 has been reversed greatly to my disadvantage.

The witness withdrew.

*Col. Graham.*

Colonel HENRY HOPE GRAHAM, C.B. (*Inspecting Field Officer of the London Recruiting District*), examined.

594. (*Chairman.*) Is your case exactly similar to that of Colonel Yorke?—No, it is very nearly the same, except that I cannot lay claim to such distinguished service as Colonel Yorke.

595. I see by this list that you were a lieutenant-colonel of 1853, and obtained a colonelcy by three years' service?—Yes, by three years' service.

596. And then in 1858 you were put back again, were you not?—Yes, about 60 going over me.

597. Having been superseded in the meantime by the Queen's aides-de-camp and the distinguished-service officers?—Yes, but they are below me now.

598. Before you were reinstated by the warrant of 1858 you had been superseded by those officers appointed Queen's aides-de-camp and distinguished-service colonels?—Yes.

599. Did you consider when you were appointed to the rank of lieutenant-colonel that you were not liable to be passed over by anybody, except by the Queen's aides-de-camp and by officers holding the positions in the guards which carry the rank of colonel?—Certainly.

600. And then when the new warrant came out, founded upon the report of the Royal Commission, which had expressly recommended that the vested interests ought to be protected, you thought that you ought to be protected under that new warrant from being superseded by anybody but those by whom you were liable to be superseded before?—Yes, that is by Queen's aides-de-camp. I went over the heads of about 60 officers by qualification, and those 60 went over me again, and now the distinguished colonels want to go over me.

601. (*Mr. Bouverie.*) The 60 colonels went over you by the warrant of 1858?—Yes.

602. (*Gen. Sir G. Brown.*) That warrant replaced them in the position they held before, did it not?—Yes, the clause of the warrant by which I got promotion after three years' service was ignored as I consider by that.

603. (*Chairman.*) Do you not consider that, if in 1854 you and all the other lieutenant-colonels had been made colonels, which was the measure adopted in 1858, nobody would have had any cause of complaint?—No, I suppose not.

604. You could not complain at all of being kept in that position?—Certainly not.

605. And those officers who would not have been made distinguished-service colonels until after that, would have had nothing to complain of because you would have been senior to them?—Yes, just so.

606. Have you any special case?—No; I commanded my regiment in a very bad climate in the hopes of getting colonel's rank, and it went for nothing; the same number of officers that I went over were put over me again.

607. Having been, I will not say dissatisfied, because no officer is ever dissatisfied, but disappointed by the operation of the warrant of 1854 and afterwards compensated by the warrant of 1858, you think it very hard that you should be again superseded?—Yes, by the distinguished officers.

608. You have no right to complain of being put in the position you have been placed in, have you?—No.

609. You cannot claim the advantages of the warrant of 1854, and then turn round and complain of the other part of it?—No.

610. You cannot say, I wish to go up by the warrant of 1854 as far as the three years' service is concerned, because that places me higher on the list, but I object to the warrant of 1854 because that places distinguished-service officers over my head?—No, they must both be taken together.

611. You consider, do you not, that the warrant of 1858 only did an act of justice by replacing the officers who had been injuriously affected in their former positions on the list?—Certainly.

612. (*Gen. Sir G. Brown.*) You would have been perfectly satisfied if the warrant of 1858 had appointed you a colonel on the 29th of April 1856, should you not?—That is what I was by the warrant of 1854.

613. You would have been perfectly satisfied if you had obtained the rank of colonel in 1856 instead of 1854, should you not?—Provided the other 60 officers were kept junior to me.

614. (*Chairman.*) It is not the date of your promotion but the date of the others that you care about?—Yes.

The witness withdrew.

*Col. H. Tidy.*

Colonel THOMAS HOLMES TIDY, Unatt. (*Assistant Adjutant General*), examined.

615. (*Chairman.*) This is, I believe, the first time you have made any application?—Yes.

616. You have expressed a wish to be examined before this Commission, have you not?—I merely felt it my duty to say a few words in defence of my position.

617. Will you point out where you stand on the list?—I am a lieutenant-colonel of March 1854, and now stand as colonel of November 1854.

618. (*Gen. Sir G. Brown.*) You were only eight or nine months a lieutenant-colonel, were you?—I was a very short time a lieutenant-colonel according to the warrant of 1854, and the gazette of 1858. I merely pin my faith upon these two clauses of the warrant, the 13th and 14th, "That field officers commissioned as such before the 20th June 1854" (I was one of those) "be allowed to rise by brevet;" it appears to me that I did rise by special favour of the Queen, upon the recommendation of certain Commissioners by brevet to the rank of colonel in 1854; I claim therefore to be allowed to stay there, that is all I claim. The Queen's aides-de-camp are Queen's aides-de-camp of 1855.

619. Do you consider it necessary to constitute a brevet that 100 men should be promoted at a time; do not two men constitute a brevet as much as 200; if you were promoted alone, it would be still a brevet, would it not?—I look upon the brevet of 1858 as a special brevet.

620. That you should be all promoted together?—Yes.

621. It has been very usually the custom for lieutenant-colonels up to a certain date to be included in a general brevet as colonels, but there is no necessity for that. Occasionally you see in the gazette a brevet, "lieutenant-colonel so-and-so to be "colonel," or "captain so-and-so to be major," any one of those constitute a brevet, but not a general

brevet; by "brevet" the clause means receiving brevet rank, does it not?—Yes, I only mean that that gazette having been issued, and I having been in my present position for nearly five years, I have some claim not to be superseded now.

622. (*Mr. Bouverie.*) This gives you a vested right, in your opinion, and you stand upon that?—Yes, I think so. I was a lieutenant-colonel before June 1854.

623. (*Chairman.*) Your interests were recommended to be protected?—I think so. I see in a list upon the table it is stated that those officers who are printed in italics are the only complainers. Now I never complained of anything; I never should have made my appearance here but that I thought it my duty to do so. This memorandum says that I am one of those who were passed over under the three years' clause; I am not one of those who were passed over under the three years' clause, nor am I a complainant.

624. Then that paper is not correct in that respect?—It is incorrect, so far as I am concerned, because I never was a complainant.

625. Were you passed over?—I was not passed over. I became a full colonel after serving three years as deputy adjutant-general. I am stated here as being one of those passed over, and also as being a complainant, but I should have become a colonel in the natural order of things in 1857, and so I was before the gazette of 1858 appeared, which by the Queen's grace made me a colonel of 1854; that is now nearly five years ago.

626. That replaced you in exactly the same position as the other lieutenant-colonels of June 1854?—Yes, with this exception, that some gentlemen who had been sitting quietly still in the meantime have gone over our heads. There are in this list majors who retired from the service; they were brevet lieutenant-colonels, it is true, but they retired from the service ten years ago, and then I found them by the *bouleversement*, which took place in 1858, placed over my head in that Gazette.

627. They were senior to you in 1854?—In 1854 they were on the half-pay list senior to me.

628. They were senior to you in the *Army List*?—Yes. I passed over their heads by the operation of the warrant, which said that three years' service was the only way in which you were for the future to obtain the rank of colonel; in fact, that nobody else was to be promoted unless they qualified for the rank.

The witness withdrew.

Colonel William Robert Nedham, (*Commanding R. Art., Sheerness*), examined.

629. (*Chairman.*) You wish to be examined before this Commission, and to make a statement, I believe?—Yes. I will read a letter which I have General Forster's permission to lay before the Commission: "Sheerness, 16th May 1863. Sir,—I have the honour "to submit the following statement for the considera- "tion of his Royal Highness the field marshal "commanding in chief. Her Majesty's Royal Com- "missioners have been directed to inquire into the "position of the distinguished-service colonels pro- "moted to that rank in the years 1855 and 1856. "Should the list of colonels be recommended for "alteration by Her Majesty's Royal Commissioners, "I consider that my interests would be considerably "affected; I have therefore the honour to request "that you will be so good as to submit the statement "to the field marshal commanding in chief, with a "view to its being submitted to the Royal Commis- "sioners, should his Royal Highness approve of the "same. Any alteration of the list of colonels of the "28th November 1854, as regulated by the Royal "warrant of October 1858, in paragraphs 13 and 14, "by the antedating of the commissions of the colo- "nels promoted for distinguished service in the years "1855 and 1856, would affect my interests very con- "siderably, for the following reasons: having become "a lieutenant-colonel on the 14th February 1854, "I, along with many other lieutenant-colonels, were "either promoted to the rank of colonel, with the "date of 28th November 1854, or antedated to that day "by the effect of Her Majesty's Royal warrant of Oc- "tober, 1858, which was deemed necessary, on ac- "count of the warrant of October, 1854, not having "taken cognizance of the claims of the officers who "had become lieutenant-colonels before the 20th "June, 1854, on which day, a brevet was announced "with the understanding that the officers promoted "on that day, or afterwards, were to be guided in "their future promotion by a royal warrant which "would soon appear, and which was promulgated in "the following October. The rectifying royal war- "rant of October 1858 placed the colonels who (as "lieutenant-colonels) were not subject to the royal "warrant of October 1854 in their proper seniority; "that is to say, the colonels who had become "lieutenant-colonels before the 20th June 1854. "The colonels of 1855 and 1856, promoted for dis- "tinguished service, I presume wish to be placed "as colonels in the year 1854; manifestly they cannot "claim the foot of that list, as they would gain no "advantage by it. I can only, therefore, suppose that "they claim to be placed in the year 1854, at least, "before the colonels who bear the date of the 28th "November of that year, and who had previously "become lieutenant-colonels before the operation of "the royal warrant of 1854. I beg leave to submit, "with the greatest respect, that if such an event took "place, I should consider it as a great injustice to "myself; for instance"—(I did not wish to mention names because many of the officers are my friends, but I could not make my statement without mention- ing them)—"Firstly—Take the date, 28th November "1854, when I, with many other lieutenant-colonels, "(who were not subject to the royal warrant of Oc- "tober 1854,) were promoted colonels on the 28th "November 1854, Colonels Dickson, Sir David "Wood, Fitzmayer, and Lysons, were certainly "lieutenant-colonels, but they only became such on "the 20th June 1854, or afterwards, under the regu- "lations of the royal warrant of the following Octo- "ber. I claim that the officers mentioned above "should not be promoted over my head, as I was a "lieutenant-colonel, under the old system, previous "to the operation of the royal warrant of October "1854. This remark also applies to any officers who "are now colonels junior to myself in the year 1854, "and who were promoted in 1855 for distinguished "conduct. Secondly—Colonels Sir Thomas Trou- "bridge, Norcott, the Earl of Longford, and H. S. H. "Prince Edward of Saxe-Weimar, did not become "lieutenant colonels before the 12th December, 1854, "and Colonel Lake not until the 9th February, "1855; therefore, on the 28th November 1854, the "date of my being promoted a colonel, the above- "named officers were not lieutenant-colonels, but "majors only. I most respectfully object to the "above-named officers being placed in the list of "colonels before me. Thirdly, Colonels Gordon, "Chapman, and Wetherall, did not become majors "until the 12th December 1854, therefore on the "28th November 1854, the date of my being made a "colonel, the above-named officers were simply "captains in the army. In their cases I submit "most respectfully that it would be necessary to "ante-date two of each of their commissions, so that "they might be placed above me in the list of "colonels. In the case of the officers just alluded "to, in the 3rd paragraph, they claim to be made "colonels anterior to the date 28th November 1854, "when actually, at the period they claim to be "colonels, they were only captains. The officers "alluded to in the 2nd paragraph claim to be made "colonels anterior to 28th November 1854, when "they were only majors at the time, and the officers

*Col. R. Nedham.*

May 1863.

" mentioned in the 1st paragraph, though lieutenant-
" colonels on the 28th November 1854, were all
" promoted as such on or after the 20th June 1854,
" and therefore subject to the royal warrant of the
" October following. For all the foregoing reasons
" I should feel deeply aggrieved if any of the officers
" promoted for distinguished service in the years
" 1855 and 1856 (who were junior to me as lieuten-
" ant-colonels) were placed above me in the list of
" colonels. If the officers named in paragraphs Nos.
" 2 and 3 were antedated as colonels, to 28th
" November 1854, or before, they would be holding
" commissions as colonels at a date at which they
" were either majors or captains in the army. I feel
" much respect for the officers who received the rank
" of colonel for distinguished service in the Crimea,
" but I humbly conceive that they have no claim to
" be placed over myself, having become a lieutenant-
" colonel before the brevet of the 20th June 1854,
" and before the operation of the warrant of the fol-
" lowing October. Lieutenant-colonels promoted
" upon the old system, I conceive, have, *almost*, a
" right to be promoted by seniority to be colonels,
" as acknowledged in paragraphs 13 and 14 of Her
" Majesty's warrant of October 1858. In conclusion,
" I most respectfully submit, that the colonels pro-
" moted for distinguished service (now junior to
" myself), have no claim to be placed over me.
" Firstly, because I became a lieutenant-colonel be-
" fore the 20th June, 1854; secondly, because at the
" period I became a colonel, some of the colonels of 1855
" and 1856, promoted for distinguished service, were
" not only not lieutenant-colonels but either majors
" or captains, and those who were lieutenant-colonels
" on the 28th November, 1854, junior to myself, have
" no claim to be placed before me, as I became a
" lieutenant-colonel before the 20th June 1854."

630. Have you anything to add to that statement?—Nothing, except that I omitted to mention the mode of promotion from the rank of lieutenant-colonel to that of colonel, by Her Majesty, antecedently to the 20th June 1854.

631. Before the 20th June 1854 you always considered yourself liable to be superseded by officers appointed aides-de-camp to Her Majesty?—Only in the case of the Queen's aides-de-camp, and in the case you mentioned just now of lieutenant-colonels of the guards.

632. You draw a distinction between officers appointed Queen's aides-de-camp and officers promoted for distinguished service in the field?—A great distinction, because, until the 20th of June 1854, lieutenant-colonels were not promoted for distinguished service in the field, except by being made Queen's aides-de-camp.

633. You think that was a new regulation, instituted by the warrant of 1854, and that you ought not to have suffered from it?—Exactly. I think I did not state that I became a lieutenant-colonel in February 1854.

634. (*Gen. Sir G. Brown.*) You were a lieutenant-colonel for only 9 or 10 months, were you not?—From February till November. I did not expect the promotion, of course, but it was produced by the rectifying warrant of 1858, in order to put us in our proper places.

635. (*Mr. Bouverie.*) Had you become a colonel by three years' service in the meantime?—No; I had some leave at that time. The order with reference to leave was not promulgated to the Royal Artillery, which was under the Ordnance Office at that period; however, I became a full colonel in November or December 1857. I lost some months by my leave.

636. (*Gen. Sir G. Brown.*) If, instead of recommending you to be promoted altogether in 1854, they had required you to serve three years from the date of your lieutenant-colonelcy, you would not have considered it a hardship, should you?—I should not have considered it a hardship to be a colonel in three years after I became a lieutenant-colonel, but I should have considered it a very great hardship to be put down in the list of lieutenant-colonels according to my original seniority by the warrant of 1858.

637. You were a lieutenant-colonel of 1854, I think?—Yes.

638. Without reference to anything that has passed, supposing the Commission in 1858 had proposed to make you a full colonel of 1857, dating your commission back to three years from the date of your lieutenant-colonelcy, you would have been satisfied, would not you, and have considered it a great boon?—If it did not displace me in my seniority.

639. It would not have affected your seniority, would it?—Yes, it would.

640. (*Chairman.*) You would not have been satisfied with a position, in which junior officers had been placed over your head, who were not placed over your head when you were appointed a lieutenant-colonel in 1854?—Exactly.

641. (*Gen. Sir G. Brown*) Would you have questioned anything about Queen's aides-de-camp and distinguished-service colonels or anybody else, provided you had got the rank of colonel between 1854 and 1857. Will you just consider what you would have thought at that time?—Naturally any lieutenant-colonel, if he is told "You shall be made a full " colonel in three years," would be very well satisfied. I did not wish to be made a colonel in six months, but we were made colonels, some in six months, some in a year, and some in two years, in order to replace us in our seniority. When I became a lieutenant-colonel it was a strict promotion to colonel, with the exception of the promotion of the Queen's aides-de-camp and certain ranks in the guards.

642. Supposing this Commission of 1858, instead of proposing that you and others similarly situated should become colonels of 1854, had proposed that you should become colonels in 1857, that is, three years after the date of your lieutenant-colonelcy, that would not have altered your relative positions at all, and you would have been very well pleased, would you not?—I should have been satisfied with a colonelcy in three years, provided my relative position was not altered.

643. (*Chairman.*) You distinctly answer that you would have considered it no hardship, provided your position had been maintained?—Yes.

644. (*Maj.-Gen. Sir W. Brereton.*) If you had been aware that at that moment there were full colonels of the date of 1855 who had been placed in the *Army List* as full colonels, while you were a lieutenant-colonel, then would you have been content to wait for three years for your colonelcy?—I should have been very happy to remain three years a lieutenant-colonel if I retained my seniority.

645. (*Chairman.*) In point of fact it did not matter to you whether you remained three days or three years a lieutenant-colonel provided you retained your relative position?—Exactly. Having been a lieutenant-colonel before the 20th of June 1854, I had expected, from its being a strictly seniority list at that period, that no junior lieutenant-colonel could be made a colonel over his seniors except by being made a Queen's aide-de-camp or a lieutenant-colonel of the Life Guards.

646. Your having been made a lieutenant-colonel within three years was no advantage to you whatever?—No, the advantage was to keep my position in the list.

647. (*Maj.-Gen. Russell.*) Do you know of any other mode by which your position could have been kept in the list, save that which was adopted by antedating your commission to the 28th of November 1854?—I can conceive no other mode; it was merely re-making the list.

648. (*Maj.-Gen. Sir W. Brereton.*) Preserving your rotation?—Preserving my rotation as I stood before.

The witness withdrew.

Adjourned.

## At the War Office, Pall Mall, Tuesday, 19th May 1863.

PRESENT:

Lieut.-Gen. Right Hon. J. PEEL.
Right Hon. E. P. BOUVERIE.
Gen. Ⓦ Sir ALEXANDER WOODFORD, G.C.B., G.C.M.G.
Gen. Right Hon. Sir GEORGE BROWN, G.C.B., K.H.
Lieut.-Gen. Right Hon. the EARL OF ROSSLYN.
Maj.-Gen. Ⓦ Sir WILLIAM BRERETON, K.C.B., K.H.
Maj.-Gen. HEN. SANDHAM.
Maj.-Gen. DAVID RUSSELL, C.B.
Maj.-Gen. RANDAL RUMLEY.

LIEUT.-GEN. RIGHT HON. J. PEEL, IN THE CHAIR.

Major-General HENRY EYRE (*Commanding the Forces at Chatham*), examined.

*Maj.-Gen. H. Eyre.*

19 May 1863.

649. (*Chairman.*) You were a member of the Royal Commission of 1858 I believe?—I was.

650. It has been stated by one or two witnesses, who have given evidence before us, that the cases of the officers, whose claims are now under consideration, the Queen's aides-de-camp and the officers promoted for distinguished conduct in the field, had been overlooked by that Commission, and that the attention of the Royal Commission had not been drawn to their case; can you, as a member of that Commission, give us any information as to whether or not their case was considered by that Commission?—I left home without being aware of what branch of the subject was likely to be brought before me, but I sufficiently remember our proceedings to be able to answer that question; in fact there is no part of our proceedings which I remember better than that, because it has been kept in my recollection by being brought before the public by General Lindsay and the officers who raised the question, which question is a very important one certainly. The impression they are under has always surprised me, because nothing can be more erroneous than that impression. There is nothing that I more distinctly remember than our Commission discussing the merits, not only of all classes, but especially of these classes. Perhaps the most important meeting we had was on the 18th April 1858, when General Lindsay was examined, and I think there can be no better answer to his statement than his own evidence on that occasion, which I beg to submit to the notice of this Commission, and especially the questions and answers 61, 62, 63, 64, 74, 75, 76, 77, 83, 96, and 98, but in other parts also. It is clear that these classes of officers were considered.

pendix, es 63, 64.

651. (*Gen. Sir A. Woodford.*) Do you mean the distinguished service officers?—Yes; I cannot quite call to mind whether names were mentioned, although I even think names were quoted. However, that I will not be certain about. All I mean to assert is, that the two *classes* of officers mentioned were considered. I cannot say that any *individuals* were specially considered. I assure this Commission that I can positively say that we, most advisedly, with our eyes open, proposed the measure which we did propose; what we felt was that it was necessary. I recollect, as well as possible, great stress being laid on the term "vested interests," which was perpetually at that time, as everybody in the service knows, thrown in the teeth of the Government, and we all felt that it was a thing to put a stop to at once and for ever. We knew that some of the lieutenant-colonels had no special claim to consideration under ordinary circumstances, nevertheless we thought it necessary to include them, however great their luck, and to do something so sweeping that it would shut up this vested interest question. And, as I say, we talked a great deal about this measure, and we considered it the most effectual and the only one to be adopted. I was called upon to act with General Yorke on the Committee subsequently; we went very fully into the subject, and there was a letter to the Military Secretary, which, if it has not been before the Commission, I consider well worth their notice, because I consider that letter unanswerable.

652. (*Mr. Bouverie.*) Was that the letter written by the direction of the Commander-in-Chief, dated the 26th of September 1859?—Yes. As I say, it will be seen in General Lindsay's own evidence, independently of our discussion on the interests of all classes, that he did not allow us to overlook those classes. I speak of classes, not of any particular officers. We thought that many officers, although they had no special claim to promotion for service, had yet laid out money under the old rule, and had arrived at a stage when they looked forward to getting their general's rank without supercession, and had probably lost the opportunity of a good market at some time or other for realizing under this expectation. Therefore this new rule evidently most seriously affected them; that was the vested interest which we bore in mind, and if we had provided for only some of them who were perhaps more distinguished than the others, we should have left those officers always liable to bring forward a similar claim.

653. (*Gen. Sir G. Brown.*) Would you not have satisfied the expectations of all those officers if you had given them the rank of colonel at the termination of three years' service?—We should have abandoned the principle on which we wanted to act, by that measure.

654. (*Maj.-Gen. Russell.*) The object was to do away for ever with vested rights?—Quite so. The fact is, we considered that the brevet of June 1854 might have been a more extended one, and might have included all those officers, and our recommendation virtually made it so, and therefore I maintain that those officers were, in the year 1854, colonels, and, being colonels, nobody could go over their heads, whether he were a Queen's aide-de-camp or a distinguished-service colonel or not.

655. (*Gen. Sir G. Brown.*) The Queen's aides-de-camp have been always accustomed to go over their heads, have they not?—Not over the heads of colonels; they could not have passed over those officers if they had been made colonels.

656. (*Maj.-Gen. Sir W. Brereton.*) At all events, you are of opinion that the cases of those officers were brought before you?—Certainly these *classes* of officers. I was greatly astonished to hear that it had been stated otherwise.

657. (*Mr. Bouverie.*) It is not correct, then, to suppose that these officers have been overlooked, or that the Royal Commission forgot all about them?—It is most erroneous, but I wish to guard myself from saying that we discussed any of these particular officers; I speak of such classes.

658. (*Maj.-Gen. Sir W. Brereton.*) Is not it the case that the whole proceedings of the Royal Commission of 1858 were printed and circulated amongst the members of the Commission, but only a part of those proceedings was afterwards published to the world?—I think there is a little misconception in that respect. We determined, at starting, to take no evidence except documentary evidence, such as letters that were addressed to us; but we made an exception in General Lindsay's case, because he had started this question. He was the cause of the inquiry, as well as my memory serves me. I have not thought

*Maj.-Gen. H. Eyre.*

May 1863.

it over, but I am tolerably certain that I am right in what I say; we did not think it necessary to embody in our report that solitary evidence, although we printed and published it separately.

659. When you say "printed and published," let me ask, it does not appear in the Blue Book, does it?—No, it was not in our report; I have a copy.

660. All that you have said is authenticated in that printed document?—I consider it is. The Commission will be able to judge.

The witness withdrew.

*Maj.-Gen. J. Walpole.*

Major-General JOHN WALPOLE, R. Eng., examined.

661. (*Chairman.*) I believe you have been made acquainted with the object for which this Royal Commission has been appointed, namely, to inquire into the cases of certain officers, Her Majesty's aides-de-camp, and those who have been appointed for distinguished service in the field, and who have made an application to have their cases reconsidered; you have expressed a wish to be examined before this Commission?—I have no objection. I do not know that I have anything more to say than what I have embodied in this paper. I will read my statement:—"To Lieutenant-General the Right Honourable J. Peel, and the general officers appointed as Commissioners to inquire into the claims of certain officers promoted in 1855 to the rank of colonel, &c., United Service Club, 14th May 1863. Gentlemen,—Independent of the representations which will be made to you by the officers who received the rank of colonel for their services in the Crimea in 1855 to have their positions improved, either by the antedating of their commissions, or by having their places advanced in the *Army List*, I cannot but anticipate that separate and specific claims will be set forth by Colonels John Gordon, C.B., and Frederick Chapman, C.B. of the corps of Royal engineers, to have their cases separately considered, with a view to their superseding me in my position of major-general in the corps; because they deem an injustice has been done to them by my promotion to the rank of colonel dated the 28th November 1854, by virtue of the warrant of 1858, and whereby I have attained to my present rank. It may be remembered that on the 27th March last Major-General Lindsay in the House of Commons asked the late Secretary of State for War to move the Queen to *suspend the promotion* in the corps of Royal Engineers, occasioned by the death of Major-General Alexander Gordon, until the matters which have now been submitted to your consideration had undergone investigation. I was the officer to succeed to this vacancy, and it appeared to me a most unusual step to request a succession to be set aside, which, according to the rules of the service, and under the authority of a Queen's warrant, I was entitled to enjoy. On this occasion the late Sir George C. Lewis replied that Her Majesty's Government felt they were not justified in acceding to the proposition of the major-general, a declaration which, I beg permission to say, received the fullest support of Field Marshal His Royal Highness the Duke of Cambridge. I have, therefore, a firm confidence that in your deliberations I may receive full justice at your hands. I can make no claim to any brilliant service, yet I desire humbly to urge a long and faithful one of 45 years (many of which have been passed abroad) as some claim for consideration. In Canada I served about seven years, in Jamaica nearly three years, at the Cape of Good Hope seven years, and a short time at Gibraltar, which would have been extended to a longer period had I not been recalled to fulfil the duties of commanding engineer at Woolwich. My first commission was dated 1st August, 1816, and I did not become a captain till November 1839, having been upwards of 23 years a subaltern; on the 15th September 1848, I obtained the rank of brevet-major, for services at the Cape of Good Hope during the Kaffir insurrection of 1846–47, when I was, on the 8th of June 1846, twice wounded. On the 17th February 1854, I became a lieutenant-colonel in the corps, and by the warrant of 1858 was promoted to colonel with several other ordnance officers, our commissions bearing date 28th November 1854. Colonels Gordon and Chapman have not respectively more than 30 and 28 years of service against mine of 45, exclusive of one year and three-quarters on half pay, arising from the reduction of the army in 1819; and when I was a lieutenant-colonel in the corps, they were only captains; to be therefore superseded by officers so much my juniors would be truly galling, and extremely prejudicial to my interests; for I would beg to call attention to the circumstance that in my case the effect may be more damaging than in that of other corps, where the consequence will be only the difference in the standing in the *Army List*; whereas in my case the privilege of succeeding to a commandantship would be retarded by two officers who did not enter the army till 17 and 19 years after I did. Respectfully submitting this statement with the fullest confidence that my case will be fairly and justly considered;

"I have the honour to be, gentlemen,

"Your most obedient and humble servant,

"JOHN WALPOLE,

"Major-General, Royal Engineers."

662. Have you anything to add to the statement you have just read?—I wish to add a few remarks. The Commission are probably not unacquainted with the dates of Colonel Gordon's and Chapman's commissions as field officers. From their almost unprecedented promotion one would imagine they would be satisfied with their present position. Colonel Gordon became a Major on the 12th of December 1854, a lieutenant-colonel on the 24th April 1855, and a colonel on the 29th of June following, having acquired that rank in 6 months 19 days. Colonel Chapman was made major on the 12th of December 1854, a a lieutenant-colonel on the 24th of April 1855, and colonel on the 2d of November 1855, attaining to that step in 10 months and 21 days. This rapid promotion has placed these officers in so favourable a position that, in succeeding to the rank of major-general, even in the regular course of corps promotion, they will, in all probability, arrive at that rank with only a total service of 34 years. Very few major-generals, I believe, have been so fortunate as to attain to that rank in that time. I may mention that I feel myself warranted in making these observations, when a public paper has been promulgated showing the places where the officers are to stand, putting Colonels Gordon and Chapman before General Stehelin and myself.

Appendix, page 53.

663. Are you aware that, what you call a public paper, is merely a paper issued by a private individual, showing what the effect would be if his recommendations were carried into effect?—However, in a public letter addressed by Colonel Gordon from Canada last year to the Secretary of State for War, he alludes to the circumstance of a vacancy having occurred to which Major-General Stehelin succeeded, and to which he considered he himself ought to have succeeded; that is a public document.

Colonel Dudley W. Carleton, Coldstream Guards, examined.

*Col. D.W. Carleton.*

19 May 1863.

664. (*Chairman.*) You have probably seen a copy of the Commission which has been issued by Her Majesty?—No.

665. I will read that portion of it which relates to yourself. "Whereas it has also been represented to "us that certain Captains and Lieutenant-Colonels "of the Guards who were promoted to that rank "between the 20th June 1854 and the issuing of the "warrant of 6th October of that year, consider that "their positions in the army have been unduly in- "injured by the operation of the said warrant of 6th "October 1854, and also by the subsequent warrant "of 14th October 1858." Then it goes on to say— "We do hereby authorise and empower you our said "Commisssioners, or any three or more of you to ob- "tain information thereupon, by the examination of "all persons most competent by reason of their know- "ledge, habits, or experience to afford it; and also "by calling for all documents, papers, or records "which may appear to you, or any three or more of "you, calculated to assist your researches, and to pro- "mote the formation of a sound judgment on the "subject. And we do hereby command and require "you, or any three or more of you, to report to us, "under your hands and seals, with all convenient "speed, your opinion whether these officers are en- "titled to any redress, and if so, to recommend in "what form such redress should be accorded to "them." I understand that in consequence of this Commission being appointed you wish to state your case, will you state it?—I was promoted to a company of the guards with the rank of lieutenant-colonel after 15 years' service, on the 15th July 1854. I went out to the Crimea in the month of September, and I remained there for 13 months. I did not come home till October 1855. I had no means of hearing that a warrant was likely to come out when I was promoted to that rank, or of coming before the Commission that inquired into the case. I found myself, in the month of January 1862, superseded by 165 officers, of whom 14 were junior to me, in every rank in the service; the captains of the guards that were in the Crimea obtained no brevet rank, as it was, I believe, considered that their rank of lieutenant-colonel was a reason for not giving them any brevet rank. I conceive that if I had been a captain in the line I should have got a brevet step for the battle of Inkermann, and another brevet step if I had been senior captain of my regiment, which I was in the latter part of the campaign, after Inkerman; and then I believe I should have been qualified, by being promoted for distinguished service in the field as the term is, to succeed in due course to the rank of colonel. I applied immediately on my return, to Lord Rokeby and some other officers connected with the Royal Commissioners, and I applied to the Commander-in-Chief on the 12th of November 1860 for redress. I was told when I came home that so many of the clauses of the warrant of 1854 had given dissatisfaction that another commission was about to be issued, and that alone prevented me from making more stir. I was in hopes that, in the Commision of 1858, my case would have been considered, or that I should have had a hearing. The Commission called upon General Lindsay in 1858 and were satisfied with his evidence. I was in communication with General Lindsay about that time, and I have here, in General Lindsay's own handwriting, a memorandum that I should escape that wholesale supercession. I have a letter from General Lindsay dated 17th November 1858; it is a memorandum which is applicable to my case. When I talk in the first person singular I am giving the case of others. I hope you will not think that I am stating my own case only, but that of all those in the same category. General Lindsay wrote me this memorandum in his own handwriting, saying that I should escape that wholesale surpercession; he was in constant communication with the members of the Commission at that time. He says in his note: "37 "lieutenant-colonels have been promoted to the rank "of colonel, by which you now stand 34th on the list "for promotion by succession, and will consequently "escape that wholesale supercession which you must "otherwise have undergone." That is from General Lindsay, whose evidence was taken before the Commission of 1858.

666. He was not a member of the Commission?—No, he was not, but his evidence was taken.

667. (*Maj.-Gen. Rumley.*) What is the date of that letter?—7th November 1858; it was evidently written under a misapprehension.

668. (*Gen. Sir Alex. Woodford.*) I see in a letter to the under Secretary of State for War dated the 29th of April 1861, you say "Already have I been "passed over by a subaltern of 1854, also by "lieutenants and captains in the guards, by the effect "of a retrospective warrant?—Yes.

669. Will you explain that statement?—I was passed over in this way: unfortunately the *Army List* which refers to this is locked up at Windsor and I was not able to go down and fetch it in consequence of having had a notice to see the Commander-in-Chief yesterday. I have got it marked; however I could point it out with the annual *Hart's Army List* Colonel Honble. Leicester Curzon is the individal to whom I allude. When I was lieutenant-colonel he was a lieutenant upon the Commander-in-Chief's staff, Colonel Henry Ponsonby and Colonel Lord Arthur Hay, now Lord Walden.

670. You say by a subaltern of 1854, who was that?—That is Colonel Leicester Curzon.

671. (*Maj.-Gen Russell.*) You say by a "retrospective warrant," will you explain that?—I was a lieutenant-colonel of 14th July 1854, quite ignorant of what the proceedings of the Commissioners were likely to be, and the warrant of 1854 is dated the 6th of October.

672. (*Gen. Sir Alex. Woodford.*) How many officers do you suppose have gone over your head?—About 250, I think; there were 165 on 1st January 1862, and then in the year 1862 there were, I think, about another 100.

673. (*Chairman.*) Do you represent Colonel Hepburn in this examination?—I represent the case of Colonel Hepburn, Colonel Bruce, and Lieut-Colonel Charteris. Colonel Charteris is out of the guards; I do not know whether his case is to be considered in the same category or not. Colonel Hepburn is out of town; I have sent to Col. Stephenson, but I have not been able to communicate with him since I have received the summons. Colonel Stephenson, I conceive, is one of the officers; all those officers will be affected in the same way, although they have obtained their promotion from various causes. Colonel Stephenson's, I conceive, is one of the hardest cases. I may mention, also Colonel Wynyard; they have not been superseded by as many officers as I have.

674. Colonel Stephenson got his promotion for service in China, did he not?—Yes; still I stand 165 lower down; of those, 72 were above Colonel Airey, who was the first officer that went over my head in that "wholesale supercession," to use General Lindsay's term. There were others, from various causes, about 95 in number, who have got over Colonel Winyard's head, and about 120 over Colonel Stephenson's head.

675. Did you qualify as a mounted officer?—I acted as major in command of my battalion during a short part of the time in the Crimea, but I did not qualify as a mounted officer. I should not have applied if I had not been near my time, on account of that period, during a few months in the Crimea, when I was acting as a mounted officer; in fact, during the whole of the winter of 1854 I was second in command. It has been said that I began life in the 60th regiment, and if I had been in the 60th I should

*Col. W. Carleton.*

9 May 1863.

have received the rank that I had during the time I was in the guards. I have a statement on that point.

676. (*Gen. Sir G. Brown.*) Did you purchase your lieutenant-colonelcy?—No; I obtained it on the augmentation of the army.

677. You obtained it after the issue of the warrant of 1854?—No, four months previously to it, and it is upon that that I base my chief grievance, if I may use the word.

678. (*Chairman.*) I understand that what you complain of is that the operation of the warrant of 1854 should have had a retrospective effect as far as you are concerned, and that, having been one of those officers, who were appointed lieutenant-colonel between the 20th of June, and the 6th of October 1854, you ought not to have been subjected to the provisions of that warrant?—Yes, exactly.

679. On the 1st of July 1854 you were a lieutenant and captain in Her Majesty's service?—Yes.

680. On the 20th of June 1854 there were 124 majors in Her Majesty's service who were appointed lieutenant-colonels on that date, by the brevet which came out then?—Yes.

681. They were, therefore, lieutenant-colonels on the 20th of June 1854, at a period at which you were a captain?—Yes.

682. But they are all subject to the provisions of that warrant of 1854, because it was notified in the gazette which appointed them to be lieutenant-colonels that they were subject to the provisions of any new warrant which might be issued?—If I rightly understand it, they had the rank of major conceded to them.

683. They were the senior majors, and were made lieutenant-colonels; it is quite evident that the operation of that warrant applied to them, because it was notified to them in the Gazette of the 20th June that they were promoted subject to the provisions of any new warrant that might come out. Was not it in consequence of that brevet of the 20th of June 1854 that you obtained a lieutenant-colonelcy; did you not obtain three steps by that brevet of 1854?—I obtained my steps by the augmentation of the army; there were eight companies, and they were increased to 10.

684. You had become senior captain and lieutenant-colonel?—It is a question I should not like to answer at random. I know there was a step.

685. If it had not been for that Gazette of 1854, you would not have obtained your promotion probably previously to the 6th of October, would you?—I think I probably should, because Colonel Trevelyan and Colonel Boyle died at Varna, and I think that would have given me my step.

686. Was that previously to October?—Yes. I was sent out at 48 hours' notice in consequence of Colonel Boyle's death.

687. It is perfectly evident, is it not, that all those officers, who were lieutenant-colonels on the 20th of June, before you had obtained a lieutenant-colonelcy, were subject to the provisions of this warrant?—They were brevet lieutenant-colonels, which was an advantage to them, whereas I had 15 years' service.

688. The report of the Royal Commission had been published previously to your promotion, had it not?—I think not, but I cannot tell.

689. The brevet of the 20th of June must have taken place previously to your promotion?—Yes; certainly.

690. The case of the officers of the guards was exactly similar to the case of any officers who were promoted to the rank of lieutenant-colonel previously to the issue of the warrant of 1854?—Would their case not be that, having arrived at the top of their respective rank regimentally, and by slow succession in time of peace, at the outbreak of the war, they had no alternative, so to say, save to go on serving, and they were bound to accept what was given them as a boon, although it was very disadvantageous to them?

691. I do not speak of those officers who were appointed by the brevet, but I speak of those officers who, in the regular course of promotion in the line, got their promotion as lieutenant-colonels previously to the issue of the warrant of the 6th of October 1854, they would have just as good a right to claim exemption from the provisions of that warrant as the officers of the guards?—I am not sure that I can quite follow you in that.

692. I understand you, on your own part, and on the part of the other officers of the Guards, to claim exemption from the application of that warrant of 1854 because you were appointed lieutenant-colonel previously to its coming out?—Yes.

693. Would not any other officers who had been appointed lieutenant-colonels previously to its coming out, whether in the regular course of promotion or otherwise, have an equal right to claim exemption from being superseded?—When they arrived at the top of the list.

694. I do not understand that your position refers to your being at the top or the bottom of the list; you were appointed a lieutenant-colonel before this warrant came out, but subsequently to the appearance in the Gazette of the announcement that the officers then promoted would be subject to a future warrant?—But they had no alternative but that of declining their promotion. I submit that if I could have declined that promotion I have a right with 15 years' service to assume that I should have been the senior captain of a regiment of the line, and in that case I should have been better off than with that lieutenant-colonelcy which I was forced to accept with those conditions.

695. You have stated that under the new regulations it would be impossible for you to become a colonel before 1865. I am happy to think that you were greatly disappointed in that, and that in 1862 you did become a colonel in Her Majesty's service?—I became a colonel because Her Majesty has not yet, I believe, enforced the provisions as regards the majors of the Guards. I became a colonel in consequence of my succeeding to a majority in the Guards. I had been at the top of the list of lieutenant-colonels ever since the 20th December 1859; that is three years for which I was at the top of the list, treading water.

696. But having attained the rank of Colonel by becoming a major in the Guards, how many lieutenant-colonels did you pass over by that appointment?—I do not think I passed over any at all. I had been a senior lieutenant-colonel of the army for three years.

697. Then you obtained no advantage?—I obtained a very great disadvantage.

698. Not by becoming a colonel?—No, not by becoming a colonel. I was at the top of the list.

699. Then your answer to my question is, that you passed over nobody's head?—I passed over nobody's head. I do not know whether there are one or two of those lieutenant-colonels who were not on service. I had been during three years at the top of the list. I passed over the heads of Colonels Charteris and Hepburn, they were in exactly the same category as myself also some of those half-pay captains who were quite at the top of the list.

700. You did obtain an advantage by that peculiar regulation which applies to the Household Troops?—I passed over the heads of two officers, Colonel Charteris and Colonel Hepburn, who are guardsmen. With respect to the others, if I understand the provisions of these warrants rightly, which I am not at all sure that I do, those half-pay captains being lieutenant-colonels can only succeed, I believe, to colonelcies when a vacancy is created by an officer in a similar position.

701. If your appointment to the rank of lieutenant-colonel had been subsequently to the 6th of October 1854, you would naturally have been subject to the provisions of the warrant of 1854?—Yes, and to any law that was in existence before I succeeded.

702. Do you not consider that the notification of the Gazette of the 20th of June 1854, rendered you subject to the warrant of October the 6th?—No, indeed, I do not, for I see so many notifications in the Gazettes that are made null and void within a year or so.

703. Until it was made null and void was not that notification binding?—Do you consider that that was sufficient when you had what you may call a vested interest after 15 years' service?

704. The vested interest did not arise until you became a lieutenant-colonel, and if in the Gazette it appeared that all subsequent promotions were to be subject to a warrant which was to come out hereafter surely your rank was subject to that provision?—I had not the option.

705. Nor had any of those officers who were promoted then; it might have been an advantage to them to remain senior majors?—As senior majors they might have retained their position as regimental majors, it could hardly have been better for them I think. I am exhibiting how it would have been better for my special case; I should have had two steps by brevet majority, and I should have qualified for promotion by what is called distinguished service in the field.

706. As I understand, you would not have been, or, at all events, it is probable that you might not have been, a lieutenant-colonel at all, previously to the 6th of October 1854, if it had not been for the promotion which you obtained by the brevet which took place in consequence of the recommendation of the Royal Commission of 1854?—I think I must have been. I am not in a position to answer that positively. I think that I certainly should have been by the augmentation of the army that was required by the exigencies of the war service.

707. It was to such new appointments that the warrant was intended to apply, was it not?—Pardon me, I think if the brevet had not existed, I should have obtained the rank. I think the brevet took two men, and those two men would have been covered by the death vacancies to which I allude; this is put as a hypothetical case. I see I passed over a cornet of 1795.

708. It appears that the Royal Commissioners who sat in 1854 recommended in their report that all the existing interests should be protected, and that in order to protect them a general brevet should take place; and it is quite evident that their intention was that their recommendation should have effect with regard to all future and prospective appointments; you suffered from an altered position altogether with regard to the Guards officers. I think a new disqualification, as I might almost call it, as regards the Guards officers was introduced by the warrant of 1854, was it not?—Yes.

709. Placing them in a worse position than they had been in before?—Yes, inasmuch as no qualification was required before the warrant of 1854, but that required three years and the warrant of 1858 five years service.

710. Previously to the warrant of 1854 the Guards rose to their natural position that they took in the *Army List* as lieutenant-colonels, did they not?—Yes.

711. I think we clearly understand that what you state is this, that having been appointed a lieutenant-colonel previously to the issue of the warrant of 1854, you claim that you ought not to have been subject to it?—That I should not have been subject with the other officers to this disadvantage. I submit that my grievance, if I may use the word, is supported by looking back to what the effect of it has been. I am passed over without any good cause by, I believe, 250 officers. I could count them up in a very short time, and send in their number. There were a great number who were on service. That circumstance effectually debars me from that prospect which I considered during my first 16 years of service I had some right to look forward to.

712. Supposing you had only been appointed a lieutenant-colonel subsequent to the 6th of October 1854, you would have been still superseded?—I should still have been superseded, but the law would have been promulgated at the time of my commission, that warrant would have been in force and would have been before the public, whereas I venture to say there were not three regimental officers in the army who knew what that warrant was of October 1854.

713. Did they not know that they were subject to it, whatever it might be?—No, it had been so stated in the Gazette, it was held out to them that some enactment of the kind was to come out, but what it was likely to be they were not in a position to judge when they went out on service.

714. What was the general effect of the warrant of 1854 on the officers of the Guards, leaving out of consideration your own case?—The general effect was disadvantageous.

715. Are they continually passed over now?—Continually, there was a batch of lieutenant-colonels promoted the other day.

716. Is not there in the report of Sir Charles Yorke's committee something which refers to that subject?—I believe there is.

717. In the 102nd paragraph of the commission of 1858 it is stated, that "If experience shall show that "this inequality in the promotion of the Guards and "Line is permanent or increasing, and that in that "respect the intentions of the commission of 1854 "have not been fulfilled, the military authorities in "that case would in our opinion be justified in taking "such measures as may remove that inequality with-"out sacrificing the principle of exacting a qualifying "service in one rank before attaining another"?—Yes.

718. That was a recommendation. I believe Sir Charles Yorke's Committee referred to that recommendation of 1858?—Yes.

719. Do you consider that the inequality on account of the three years rule is increasing?—I think it is not increasing, because I think it is counterbalanced by the rapidity of promotion in the Guards, but I think that it has acted very prejudicially upon officers of about my own standing. I think the Commissioners will see, if they look at the *Army Lists* of 1854 and 1858, the very great difference that exists in the standing of officers who were subalterns; they will see that a great number of officers have left the Guards about that period.

720. (*Gen. Sir A. Woodford.*) At page 5 of the report of the Committee of 1861, I find these words: "It appears that of all the officers promoted "to be lieutenant-colonels on the 20th June 1854, "and between that date and the issuing of the war-"rant of the 6th October of that year, none but the "following officers of the Foot Guards remain in "that rank, the last officer of the line (Colonel "Halliday, 36th Regiment) having been promoted "on the 13th December 1859," and you were promoted in 1862?—Yes, on the 26th of December 1862, antedated to 9th November.

721. Colonel Hepburn was appointed brevet colonel on the 2nd of February 1863, having served his five years as a mounted officer?—Yes.

The witness withdrew.

*Maj. Marvin.*

May 1863.

Major William Marvin, (*War Office*), examined.

722. (*Chairman.*) I think you were in that position in the War Office in the year 1858, if not in 1854, in which the question of drawing out warrants and the framing of them was referred to you?—Yes; in 1858, but not in 1854.

723. Will you state what was the practice in the army previously to the Royal warrant of 1854 with regard to the promotion from the rank of lieutenant-colonel to that of colonel?—As far as my knowledge enables me to answer the question, no officer in the cavalry or infantry could advance to the rank of colonel otherwise than by length of service under the system of periodical brevet, except by promotion as Queen's aide-de-camp.

724. And certain ranks in the guards which gave the position?—Yes, and the rank of regimental-colonel in artillery and engineers, which carried the officer up just the same as if he were a Queen's aide-de-camp.

725. Then you consider that the introduction, by the warrant of 1854, of the promotion to the rank of colonel being recommended for distinguished service, was a new arrangement?—Quite so, to the best of my knowledge.

726. As new as promotion for a certain number of years' service?—Yes, quite so.

727. You were, I think, secretary to the Royal Commission of 1858?—Yes.

728. As secretary can you give this Commission any information as to whether the cases of the lieutenant-colonels and the distinguished service officers were considered by that Royal Commission?—So far as this, that General Lindsay, who was the only witness examined, stated his view of their case, and a copy of the proceedings was sent to each member of the Commission.

729. General Lindsay was examined and in the course of his examination certain questions were put with regard to the cases of the distinguished-service officers?—Yes.

730. Therefore, so far as that goes, there can be no doubt that their cases were brought before the Commission?—Their cases were brought before the Commission by General Lindsay's evidence, which was printed, and each member had a copy of it laid before him at the following meeting, or a copy was sent to his residence. I am not sure whether on the day on which General Lindsay was examined all the members were present. I have a memorandum by which I can tell exactly the members present on that day. My memorandum says, "Present, the same "members as on the 21st, except Sir James Scarlett, "from whom a telegram was received stating that he "could not attend." Their names are also printed in the minutes of evidence.

731. Subsequently to the report of the Royal Commission of 1858 orders were issued from this department, from the Secretary of State, to prepare a warrant founded upon the report of the Commissioners?—Yes.

732. To whom would the Secretary of State give directions that the warrant should be prepared?—The Under-Secretary, or the secretary for military correspondence, who would give me instructions either verbally or in writing.

733. Can you recollect what the instructions were that you received with regard to the preparation of that warrant?—To prepare the warrant strictly in accordance with the recommendations of the Commissioners, adopting such provisions of the old warrant of 1854 as had not been altered, and introducing such new provisions as were contained in the report of the Commission. I can tick off the paragraphs of the report on which each clause of the warrant of 1858 was founded.

734. Therefore, in fact, the warrant of 1858 was prepared strictly in accordance with the report of the Royal Commission of 1858?—Most strictly so.

735. Did you prepare the warrant of 1854?—I did not. The warrant of 1854 was drawn up by Mr. Croomes. Mr. Ramsay was the secretary of the Commission. Mr. Croomes furnished a paper to some of the distinguished-service colonels (to Sir Thomas Troubridge, I believe), in which his views of the original warrant are fully expressed; of course I can only speak with certainty of what was required to be done in the preparation of the warrant of 1858, which was to adopt the provisions of the former warrant that had not been altered, and to introduce the new provisions recommended by the Royal Commission of 1858. Appendix, page 53.

736. Of course you have read the report of the Royal Commisson of 1854?—Yes.

737. In which they recommended that the existing interests should be protected?—Yes.

738. And you have also seen the warrant of 1854?—Yes, certainly.

739. In which that recommendation does not appear to have been carried out?—It does not appear to me to have been carried out as it might have been; it says in the 8th clause that officers promoted before the 20th of June 1854 shall "be allowed to rise by "brevet as under the regulations then in force," with a view, it is presumed, to protect existing interests; but the clause in question is altogether silent as to the precise mode in which this protection was to be afforded. In my view of the case a provision should have been introduced to the effect that as an officer who had completed his three years' service became a colonel, those who stood before him who had not qualified should go up with him, that is to say, all between the one promoted then and the one who had been promoted immediately before him; half-a-dozen or more might perhaps intervene; this is certainly the course I should have suggested if I had been called upon to draw up the warrant of 1854.

740. It would not have protected them from being superseded by officers promoted for distinguished service, which promotion also you stated to be something new introduced by the warrant of 1854?—The distinguished service officers must of course have superseded them, because they would not have waited to complete the three years' service.

741. Then that three years' service protection would not have been a sufficient protection from the effects of the warrant of 1854?—No, because a new principle had been introduced in the warrant of 1854 which did not exist before. The only chance of being superseded before 1854 was by a Queen's aide-de-camp.

742. Therefore what you propose would not have protected them from that?—No, not from that.

743. In point of fact it would not have been a sufficient protection against all the new clauses in the warrant of 1854?—Certainly not.

744. By the warrant of 1854 what protection was given to the existing interests of the colonels; there was a new system introduced of promotion to the rank of major-general, was not there?—Yes, for distinguished service in the field.

745. But still there was some protection given, was there not, to those who were colonels at the time?—Yes, to this extent, that the major-generals promoted to that rank for distinguished service should only be brought on to the fixed establishment in alternate vacancies, every second vacancy being filled by seniority from the list of colonels.

746. Were they not made supernumeraries?—Yes, in the first instance; but they only remained so until, as stated in my reply to the previous question, they could be brought on to the fixed establishment alternately with a senior colonel. In 1858 it was considered that they ought not to be placed on the establishment, even in alternate vacancies, but that they should be made supernumeraries, and continue so till it came to their turn for promotion in the

order in which they stood originally as colonels; as, for instance, there are three supernumerary major-generals of artillery—Sir F. Williams, Sir Richard Dacres, and Dupuis, who are waiting to be brought on to the fixed establishment of artillery general officers, according to their original relative positions as colonels in the army.

747. Then the warrant of 1858 remedied a grievance with regard to the colonels as well as the lieutenant-colonels ?—Yes, certainly.

748. The case of the colonels who were suffering in that manner was fully brought before the consideration of the Commission of 1858 ?—Yes. I understand you to be speaking with reference to the generals. That subject was clearly brought under notice, and it was considered that the number of generals was not sufficient, and hence an increase from 234 in the warrant of 1854, to 260 as allowed by the warrant of 1858; and it was thought that it would be some relief if the distinguished-service general officers, who had been promoted out of their turn, were removed from the established list in order to give promotion to the senior colonels.

749. Therefore, in fact, the country was put to an additional expense in order to rectify what had been an oversight in the warrant of 1854 ?—Yes, it was supposed by the Commission that, if the war had continued, the number of distinguished-service generals would have been so great that the promotion of the colonels, in the order of seniority, would have been seriously retarded.

750. I think I may say, having been Secretary of State in 1858, that the directions which were given were to carry out strictly the recommendations of the Royal Commission of 1858 in the form of the new warrant ?—Quite so.

751. Do you consider that that was done ?—Strictly; I challenge the comparison of every word in the report of the Commissions with the warrant founded upon that report.

752. (*Gen. Sir G. Brown.*) Did the Commissioners of 1858 make any specific regulation with reference to the officers promoted for distinguished service, or the Queen's aides-de-camp ?—The Commissioners made no allusion to them in their report.

753. They did not refer to them at all ?—There is nothing said in their report; the only statement in print is what you have seen in General Lindsay's evidence.

754. It did not occur to the Commission that in putting all lieutenant-colonels back, by giving them a retrospective promotion, they would affect the position of those distinguished colonels ?—I cannot go so far as that; there was a discussion between the different members on the subject of the distinguished-service officers, but it was not noted for insertion in the report of the Commission.

755. (*Maj.-Gen. Sir W. Brereton.*) A great deal of what passed at that Commission was never reported at all ?—Just so; there was a conversation between the Commander-in-Chief, the Chairman, and others on this, and other matters, not specifically mentioned in the report.

756. Still the subject was very amply discussed ?—Yes, as I have explained; but, it not being for insertion in the report, I did not take that interest in it which I should have done if I had had to take a note of it.

757. (*Gen. Sir G. Brown.*) It was not referred to in the recommendation of the Commission, was it ?—No; there is nothing about it in the recommendation.

758. (*Maj.-Gen. Russell.*) The point was mooted, and discussed among the members ?—Yes, it was mutually discussed among the members.

759. (*Chairman.*) If in 1854, in order to protect those officers, the whole of the then existing lieutenant-colonels had been made colonels, there would have been no hardship towards any of the distinguished service colonels or the Queen's aides-de-camp, would there ?—No; they would have come at the bottom of the list, as a matter of course.

760. That was, in fact, what the Commission of 1858 recommended should be done ?—They considered two or three different plans, which occurred to different members, and they thought the best course to adopt would be to promote every lieutenant-colonel to the rank of colonel who was a lieutenant-colonel before the 20th of June 1854.

761. And although some of those officers would have been a very short time lieutenant-colonels, if they had been promoted on the 20th of June 1854, there was no rule in the service which required a certain length of service between the ranks of lieutenant-colonel and colonel, was there ?—None, that I am aware of.

762. Had you anything to do with the preparation of the instructions in the Gazette ?—Nothing.

763. They were not submitted to you ?—No.

764. Do you consider that the notification in the Gazette which gave the brevet rank of the 20th of June 1854 would apply to all promotions subsequent to the date of that appearing in the Gazette ?—No doubt. I take it that it was the intention that every promotion that took place subsequently to that date should be regulated by it.

765. All subsequent promotions ?—Yes.

766. It would be considered a sufficient notification from this office, in your opinion ?—Yes; I should say so; it is the most public way of publishing such a notification.

767. In fact, a notification in the Gazette is the only way in which it could be done ?—Yes; everything in the way of promotion is notified in the Gazette.

768. (*Gen. Sir G. Brown.*) Did it ever occur to the Commissioners of 1858 to grant promotion to those lieutenant-colonels requiring them to complete the three years service first, in fact that the lieutenant-colonels of 1854 should be promoted after three years' service ?—It was brought before them by General Lindsay; he proposed it in one of his recommendations to the Commission. The Duke of Cambridge, following up a question from Sir H. Storks, puts this to General Lindsay : "Then will you explain "what you mean ?" General Lindsay says, "I would "take the warrant of 1854, which says that a lieu- "tenant-colonel commanding a regiment is to become "a colonel in three years, as the base of the altera- "tion. A certain number of them were promoted "on the 28th of November 1854, at which time "a good many were passed over. I would begin "with the lowest of those officers who were pro- "moted on the 28th of November 1854, and I would "promote all those above that officer, and date "them from the 28th of November 1854." That is what he proposes, which I take it is your view of the case. Appendix, page 63.

769. My view of the case was that all lieutenant-colonels, whether they commanded regiments or not, should be put in the same category, and all promoted at the end of three years, did such a proposition as that ever come before them ?—I think you will see a reference to it in the report. I think it may be inferred from what you read here : "We are, therefore, "of opinion that the cases of these 115 officers can- "not be subjected, without injustice, to any arbitrary "classification for separate treatment, and must be "considered as a whole. On this principle it has "been suggested that the effect of the warrant, "whether advantageous or disadvantageous, should "be postponed as regards all lieutenant-colonels of "date prior to 20th June 1854, and that the officers "passed over be replaced in their relative positions "as if the old rule of seniority, irrespective of service, "had never been departed from, and the new rule of "seniority by service had never been introduced." Report of 1858, page 13

770. So far that was done ?—Yes, that was done by the antedated brevet. "This arrangement, while "remedying a hardship inflicted by the warrant "on the 115 officers passed over, will, of course,

*Maj. W. Marvin.*

19 May 1863.

"make a change somewhat to their disadvantage in "the position of the 206 officers promoted after "three years' service, who, though they will not "lose rank, will lose the benefit of their relative "position and their consequent proximity to the "top of the colonels' list, which they have acquired "by service, under the warrant. The nature, "however, of the hardship suffered by the 115 "lieutenant-colonels over whom others have passed, "or the injury to those who have thus gained "their promotion over the heads of their 115 "comrades, and who would lose that advantage, "differs very much. The former have been most "injuriously affected by the loss of advantages to "which their rank entitled them, at the time "when they acquired or purchased it, and they are "still without a rise in rank which by this time they "would have acquired under the old system. The "latter would not lose rank, but would be deprived "of a portion of an additional advantage which they "never expected nor contemplated when they "acquired their lieutenant-colonelcies. Those, too, "of the 115 who have not served the required time "as field officers, will not in any way interfere with "the prospects of the officers who have so served and "have been promoted, since the former never can "fill vacancies on the fixed establishment of "generals. The latter, moreover, can be no "pecuniary losers, for they did not acquire their new "rank by purchase; and they will have acquired, "by their earlier promotion to the rank of colonel, "and will preserve, their earlier eligibility for em-"ployment with temporary rank in major-general's "commands, and the consequent prospect of rising "earlier than they otherwise would have done to "the rank and pay of major-general. The former "class, on the other hand, are now actually damnified "by the operation of the warrant, and have gained "nothing in compensation, though many of them are "ceasing to receive the prospective value for their "last outlay of purchase money. It appears, there-"fore, to us, after carefully weighing the amount of "hardship and inconvenience which will be undergone "by allowing the operation of the warrant on the "lieutenant-colonels of 1854 to remain undisturbed, "or by replacing the lieutenant-colonels passed over "on the list of colonels according to their original "seniority, there will be less hardship and incon-"venience suffered by adopting the latter than the "former cause. It appears, however, to us that it "will be less invidious to the promoted colonels, to "whom every consideration is due, and will mark "more clearly the object and intention of the pro-"ceeding, if the original error, committed in 1854 be "now rectified by granting and antedating an ex-"tension of the brevet given in that year, so as to "embrace all the lieutenant-colonels who held that "rank prior to June 20, 1854."

771. (*Lieut.-Gen. the Earl of Rosslyn.*) Does that refer to the aides-de-camp and to the officers promoted for distinguished service?—No, it is the qualified colonels promoted under the three years' rule. It has no reference to the distinguished service officers; it might, in the minds of the Commission, have a reference to them also, because they would be dove-tailed into the list amongst the colonels qualified by service, but they are not specifically mentioned in the report.

772. (*Chairman.*) The report would show us what their recommendations were?—Yes; the report says: "It appears, however, to us, that it will be less in-"vidious to the promoted colonels, to whom every "consideration is due, and will mark more clearly "the object and intention of the proceeding, if the "original error committed in 1854 be now rectified "by granting and antedating an extension of the "brevet given in that year, so as to embrace all the "lieutenant-colonels who held that rank prior to June "20, 1854." That is in the warrant, in either the 14th or 17th clause.

Report of 1858, page 13.

773. (*Maj.-Gen Russell.*) If you had read the next paragraph but one you would have seen that it referred to the then existing interests?—It says, "Having "thus then endeavoured to explain and remove the "hardships entailed on then existing interests by "the operation of the warrant of 1854, and having "satisfied ourselves that the principle of that warrant "is not only sound, but must be preserved as indis-"pensable to the efficiency of the upper ranks of the "army, we propose to leave it undisturbed as regards "the future, though we recommend some further "modifications in detail, which will, we think, facilitate "and simplify its working. And we propose to lay "down certain principles by which we think its "application should be restricted."

Report of 1858, page 1

774. That proves that what you read refers entirely to the officers who had been superseded?—Quite so.

775. (*Gen. Sir G. Brown.*) If that commission had recommended that the lieutenant-colonels should all rise alike at the end of three years, do you not think that there would have been no hardships and no difficulty raised at all; there could not have been any ground of complaint against the aides-de-camp, because that was an established rank of the army; and with re-spect to the officers promoted for distinguished service in the interim, the lieutenant-colonels would have got such an immense boon, by getting promotion at the end of three years, that they would not have com-plained at being superseded in that manner?—I think the lieutenant-colonels would have been perfectly satis-fied if they had been told that whether they were qualified or not they would be promoted to Colonel at the end of three years.

776. (*Maj.-Gen. Russell.*) If they had all originally been made colonels in 1854 at the time to which they were afterwards antedated, the distinguished service colonels and the aides-de-camp would have been perfectly satisfied to be placed below them, would they not?—They could not have objected to it, cer-tainly.

777. (*Maj.-Gen. Rumley.*) In 1854 two new fea-tures were introduced with regard to the promotions from the rank of lieutenant-colonel to that of colonel, namely, distinguished service, and service of three years?—Yes.

778. I think you stated that if you had been called upon to frame a warrant upon the recommendations of the Commission of 1854 you would have taken up the lieutenant-colonels senior to those qualified by three years' service for promotion?—Yes.

779. Would you have applied the same rule in pro-moting the colonels for distinguished conduct and taken up their seniors also; that being another new feature introduced in 1854?—No; I should have let them fall into their places according to their dates, the same as the Queen's aides-de-camp.

780. Then you would have made a distinction between the two new features introduced by the warrant of 1854?—The qualifying rule is one thing, and promotion for distinguished service is another, and I would have treated them differently.

781. But they are both new features of that warrant?—Yes, they are both new features of that warrant; but I cannot see how, with the distinguished service officers, you can carry out your rule, because you require those carried up to be governed by the three years' rule. That very question was put to General Lindsay in his examination. The chairman says: "But "if an officer, being a lieutenant-colonel, is pro-"moted to colonel for distinguished conduct in the "field, he would not carry anybody up with him; "would you not consider that an exceptional case?—"Yes, in this way, if what we are calling justice was "given to those officers who are passed over, they "would have been promoted to colonel before the "officers who were promoted for distinguished con-"duct in the field, and therefore they would be above "them. In that way the officers who are promoted "from lieutenant-colonel to colonel will be affected, "and in no other way." So that there General Lindsay did not propose that the distinguished service colonels should carry up the others.

Appendix, page 63.

*Maj. W. Marvin.*

19 May 1863.

782. My question is, with regard to framing that warrant, as these were two new features, would you have dealt with the cases differently ; in the one case would you have taken up the lieutenant-colonels senior to them, and in the other would you not ?—I have expressed such an opinion. You put the question to me for an opinion, the opinion I give is, that I would not have carried anybody up with the distinguished service officers.

783. (*Chairman.*) Was not the object of the Royal Commission of 1858 to protect those officers, who had been lieutenant-colonels previously to the 20th of June 1854, from any supercession arising out of the new warrant ?—Yes.

784. That would have been fully effected by the three years' rule, if only the three years' rule had been in your contemplation ; but, in order to protect them against being superseded by the officers promoted for distinguished service, it was necessary to antedate all their commissions to the 28th of November 1854 ?—Yes, but going back again to this Gazette, it says, "Officers promoted by the following brevet "will receive their promotions subject to the new "regulations about to be promulgated by Royal "warrant." Those new regulations were contained in the warrant of 1854. I quite understand the case which has been put to me, namely, that the promotion for distinguished conduct in the field otherwise than by appointment as Queen's aide-de-camp was a new element altogether.

London Gazettes of 1854, page 1931.

785. And the Royal Commissioners having recommended in their Report that the existing interests should be protected, if you had been desired, by the Secretary of State for War, as you were in 1858, to draw up a warrant in compliance with the recommendations of the Commission, should not you have carried it out by protecting them in that respect ?—On further consideration I admit that, keeping in view the principle of existing interests, it would be right to do so in some way, but I am not prepared to say how. My difficulty is this : when the warrant of 1854 was ordered to be prepared, a war was actually going on, so that the introduction of a clause applying the "carrying up principle" to lieutenant-colonels promoted to the rank of colonel for distinguished service, whose commissions as lieutenant-colonels were of subsequent date to 20th June 1854, would at once have had the effect of neutralizing the intended three years' clause so far as the lieutenant-colonels of dates anterior to 20th June 1854 were concerned, who would all have gone up ; while by confining the "carrying up principle" to the three years' men, the qualifying rule with reference to the old lieutenant-colonels would have lasted at least three years, *i.e.*, until 20th June 1857, when the first qualified lieutenant-colonel of 20th June 1854 would have become a colonel, then leaving the qualifying clause to go on as at present amongst the lieutenant-colonels promoted to that rank after 20th June 1854.

786. And you would not have been carrying out, as strictly, the recommendations of the Commission in 1854, as you did those of 1858, where you say you can quote paragraph against paragraph, if you neglected to do that in 1854 ?—I admit that I should not.

787. (*Lieut.-Gen. the Earl of Rosslyn.*) The warrant of 1858 may be considered as a supplement to that of 1854, may it not ?—Not a supplement, but an entire revision of the warrant of 1854.

788. Not a correction ?—So far a correction that certain clauses of the warrant of 1854 were retained in the warrant of 1858, and others altogether expunged, so that what was kept from the warrant of 1854, and the new provisions recommended by the Commission of 1858, formed the new warrant.

789. It was to revise an error which was admitted to have existed in the warrant of 1854 ?—Yes.

790. (*Chairman.*) In consequence of the Report of the Royal Commission of 1858, the commissions of a very large number of officers were antedated to the 28th of November 1854. I suppose that was to a certain extent a new measure, was not it ?—Certainly, it goes back four years, you observe.

791 Her Majesty has a perfect right to antedate the commissions, and there is no rule to the contrary ?—Certainly, and it is frequently done. There are many precedents in the department for antedating commissions.

792. We have heard a great deal about Royal Commissioners and Royal Commission, but, in point of fact, a warrant is the act of the Sovereign ?—Quite so.

793. The reports of Royal Commissioners are merely advice tendered to the Sovereign, which she may or may not be advised to take ; in fact, a report has no operation except what the Sovereign chooses to give to it ?—Quite so.

794. The warrant is the act of the Sovereign, and those officers promoted under the warrant of 1858 are as much officers as those promoted under the warrant of 1854, or as the distinguished service officers and aides-de-camp were in 1855 ?—Yes.

795. (*Lieut.-Gen. the Earl of Rosslyn.*) In the event of any officer being entitled to extra pay, would that antedate apply ?—Promotion to the rank of colonel carries no extra pay, and therefore it did not become a question.

796. It would not have carried the pay, would it ?—Certainly not, in some cases where an officer has been promoted to a vacancy, for which the issue of pay had for a time not been made, the antedate would have carried the arrears.

797. (*Maj.-Gen. Russell.*) Is it not frequently specified in the Gazette, "such antedate not to carry back pay" ?—Frequently.

The witness withdrew.

Adjourned.

---

## At the War Office, Pall Mall, Thursday, 28th May 1863.

PRESENT :

Lieut.-Gen. Right Hon. J. PEEL.
Right Hon. E. P. BOUVERIE.
Gen. Sir ALEXANDER WOODFORD, G.C.B., G.C.M.G.
Gen. Sir GEORGE BROWN, G.C.B., K.H.
Lieut.-Gen. Right Hon. the EARL OF ROSSLYN.
Maj.-Gen. Sir WILLIAM BRERETON, K.C.B., K.H.
Maj.-Gen. HENRY SANDHAM.
Maj.-Gen. DAVID RUSSELL, C.B.
Maj.-Gen. RANDAL RUMLEY.

LIEUT.-GEN. RIGHT HON. J. PEEL IN THE CHAIR.

Colonel GEORGE CAMPBELL, C.B., (*Inspector Field Officer of the Leeds Recruiting District*), examined.

*Col. G. Campbell.*

28 May 1863.

798. (*Chairman.*) You have expressed a wish, I believe, to make a statement to the Commissioners appointed to inquire into the case of the distinguished officers, and Queen's aides-de-camp ?—Yes.

799. Will you have the kindness to do so ?—I understand that the object of this Royal Commission is to test the claims that were brought forward by certain officers whose commissions bear a date junior

*Col. G. Campbell.*

28 May 1863.

to that of my own; the result of that claim may possibly be to place me, instead of being their senior, their junior; this, I consider, would be a direct act of supercession, and I come here to protest against it.

800. Will you have the goodness to state what your position was; were you a lieutenant-colonel previously to the 20th of June 1854?—Yes.

801. By the action of the warrant of 1854 several officers were placed over your head; is that the case?—No, not in 1854; I should have been placed over the heads of other officers; I was a regimental lieutenant-colonel in command of a regiment; the date of my commission is 1853, and, had that warrant continued in force, I should have got the benefit of the three years' service clause, which would have made me a full colonel, and brought me over the heads of many lieutenant-colonels who were on half-pay, not doing duty with their regiments.

802. Since 1856, when you completed your three years' service as lieutenant-colonel, commanding a regiment, many officers have been placed over your head, who had been made aides-de-camp in the meantime, or been promoted for distinguished service in the field?—Yes.

803. The operation of the warrant of 1858 was to place you back again in your original relative position to the other officers as you stood in 1854, was it not?—That was the operation of the warrant.

804. Its operation was to antedate your commission to the 28th of November 1854, and to replace you exactly in the same relative position as that which you held before any warrant came out at all?—Yes, I believe that was the effect of the warrant.

805. And you now object to any further alteration?—Yes, I object to being deprived of the advantages of the commission which I hold; I hold a colonel's commission of November 1854, and I wish to keep it.

806. You are in the same position as if there had been no warrant?—I am.

807. (*Mr. Bouverie.*) Did you become a colonel by three years' service?—I did. I became a full colonel.

808. At what date was that?—In May 1856.

809. By the operation of that three years' service rule you passed over the heads of a good many officers, as I understand, who were on half-pay, and had not an opportunity of serving three years?—Yes, and by the operation of the warrant of 1858 I was put below those officers, but above those who had, in a measure, superseded me in the meantime.

810. (*Gen. Sir G. Brown.*) Were you better off under the warrant of 1854 than under that of 1858?—I have not made a nice calculation upon that point, but I think, so far as my relative position in the *Army List* goes, I was better off.

811. The warrant of 1858 put some officers over your head?—Yes.

812. (*Chairman.*) If you were better off, others must have been worse off, must they not?—Certainly. Those who were brevet lieutenant-colonels, or lieutenant-colonels not in command of a regiment, before 1854, all suffered. I went over their heads.

813. (*Maj.-Gen. Russell.*) The objection, which you now feel, is that which is natural to all officers, namely, the objection to be superseded by juniors?—Yes; at the same time I do not allow that there is any just claim for that supercession.

814. (*Maj.-Gen. Sir W. Brereton.*) You served in India, did not you?—Yes.

815. With your regiment?—Yes.

816. I think you came home desperately wounded?—Yes, I was wounded, but I suffered more from an illness which I attribute entirely to a case of supercession. Perhaps nobody has suffered more in the service than I have done from that circumstance. No one knows what it is to suffer from a supercession better than I do.

817. (*Gen. Sir A. Woodford.*) Have you had any particular case of supercession?—Yes, there was a case in the Punjaub, when the mutiny commenced. I was stationed at Sealkote in command of my regiment, and was a full colonel; a moveable column was formed in the Punjaub, and my regiment was detailed as, in fact, the European portion of it, and I found myself placed under the orders of a captain in the Company's service and a brevet lieutenant-colonel; he was the present Sir Neville Chamberlayne. I remonstrated against my position to Maj.-Gen. Reid, then in command of the Punjaub, although he kindly told me that it was from no want of capacity that I had been superseded; but, on account of the exigency of affairs, it could not be helped.

818. (*Maj.-Gen. Sir W. Brereton.*) Was it in consequence of that supercession that you suffered so severely from illness, as you just now mentioned?—Sir Neville Chamberlayne was appointed adjutant-general of the army, and I was a second time superseded by another captain and brevet lieutenant-colonel, who was the late lamented Brigadier-General Nicholson. Both of these cases occurred in the course of six weeks, and it is to those supercessions that I attribute the deterioration of my health—it was owing to the way in which it affected my mind from morning to night constantly.

819. You wish to exemplify, in that manner, how grievous it is to an officer, especially on service, to be superseded by a junior officer?—Certainly.

820. (*Maj.-Gen. Russell.*) After commanding a brigade you, being a full colonel, received no further promotion?—No; I received nothing but a lieutenant-colonel's prize-money, and they, as brigadier-generals, received a brigadier-general's prize-money.

821. (*Maj.-Gen. Sir W. Brereton.*) You commanded a brigade at Delhi, did you not?—I did; and, as I say, I got only a lieutenant-colonel's prize-money; while they got a brigadier-general's prize-money.

822. (*Chairman.*) It had never been the custom, had it, previously to 1854, to appoint from the rank of lieutenant-colonel to that of colonel by any other means than by strict seniority, or by certain positions in the guards and the household troops which carried with them the rank of colonel?—No, I am not aware of it. I always considered that the rank of lieutenant-colonel was protected by the usages of the service. In fact I do not recollect any instance of officers, unless they were very near the top of the list, being promoted to be Queen's aides-de-camp. They were taken in that way sometimes, but certainly they were not taken from the bottom of the list and put over all the lieutenant-colonels; that was never done.

The witness withdrew.

*J. Croomes, Esq.*

JOHN CROOMES, Esq., examined.

823. (*Chairman.*) What position did you hold in the War Office in the year 1854?—I was chief clerk.

824. Did you draw out the warrant of 1854?—No, I did not. It was drawn out in the promotion room, but I was with Mr. Sidney Herbert when he corrected the rough draft of that warrant, and the particular clause relating to promotion was wholly in his handwriting.

825. Do you consider that the warrant of 1854 carried out the recommendations of the Royal Commissioners of 1854?—I do consider that the warrant of 1854 carried out those recommendations, with one exception, namely, that we forgot, during the whole of the war, and afterwards until the year 1858, the recommendation of the Commissioners that the interests of those lieutenant-colonels who were passed over by the three years' service colonels should be protected: they were neglected entirely.

826. That was a most important point, was it not?—Yes, it was most important, but it was forgotten.

It was the Secretary-at-War himself who drew out the draft. He did not mention it in his draft warrant, and therefore the clerks did not think of it.

827. The clause of the report of the Royal Commission, which you state to have been overlooked in the drawing up of the warrant of 1854, was clause No. 52?—Yes; they say "we are of opinion that a "liberal view ought to be taken of the claims of "these officers, and that in introducing a change" (which change was the abolition of brevets) "which "the public good requires, they ought to be carefully "protected from injury and from having their just "expectations disappointed."

828. Will you read the previous paragraph?—"We "have hitherto considered the question before us "only with reference to the permanent system of "promotion to be established; we are, however, "aware, that if this system were at once substituted "for that which has been hitherto in force, without "adopting some means to protect the interests of "those whose prospects would be affected by the "change, much injustice would be inflicted on many "officers who have relied on the continuance of the "present regulations."

829. Do you not take that to mean the regulations that were then in force with regard to the promotion from the rank of lieutenant-colonel to that of colonel?—Yes, that was by brevet.

830. It was always by brevet?—Yes.

831. Previously to 1854, the only promotion from the rank of lieutenant-colonel to that of colonel was by strict seniority, with the exception of officers appointed by the Sovereign to be aides-de-camp, and of certain ranks in the guards, artillery, and engineers, which carry with them the rank of colonel?—I know nothing about the artillery and engineers, but certainly, with the exception of Queen's aides-de-camp and officers promoted for distinguished service, all the promotions had been by seniority, and, in fact, by brevets generally once every third or fourth year.

832. Can you give me any instance of an officer having been promoted from the rank of lieutenant-colonel to that of colonel for distinguished service without being made a Queen's aide-de-camp?—No, it was the custom to make them Queen's aides-de-camp. I do not know of any instance of promotion in the other form. Lord Hardinge and Mr. Sidney Herbert were members of the Commission of 1854, and the moment after they came from the Commission they chose the brevet, and they took in all the officers who, in their judgment, had been lieutenant-colonels of sufficient standing.

833. (*Maj.-Gen. Sir W. Brereton.*) Applying, in fact, the new rule?—Applying that rule to the promotion by brevet.

834. (*Chairman.*) That was on the 20th of June 1854?—Yes.

835. That brevet took them in their regular rotation, without reference to service?—Yes, it took all the lieutenant-colonels of sufficient standing.

836. It took them in regular rotation to a certain point?—Yes.

837. Leaving the others to be protected as the Commission recommended?—Yes, so that their just expectations should not be disappointed.

838. You stated that there had been cases of officers who had been appointed Queen's aides-de-camp for service in the field, that was not a necessary qualification for the appointment, was it?—I imagine not, I think the Queen could have appointed anybody.

839. It was an undoubted prerogative of the Crown, without reference to service?—I think so.

840. Therefore the rule of promoting from the rank of lieutenant-colonel to that of colonel for service in the field, which had been previously strictly confined to the junior ranks of the army, (as in the case of captains promoted to be majors, and majors to be lieutenant-colonels,) was the introduction of a new system by the warrant of 1854?—Yes, the new system, which was introduced in 1854, was simply that a lieutenant-colonel who had served in command of a regiment for three years should, in virtue of that, get his colonelcy.

841. Was not there a new system introduced of promoting for distinguished service in the field from the rank of lieutenant-colonel to that of colonel?—My memory does not serve me with reference to that.

842. Is not that included in the warrant?—Yes, I find it in the warrant. The reward for distinguished service is evidently a novelty.

843. Do you not consider that that was one of the novelties from which the Royal Commissioners in 1854, as appears by the clause in their report to which we have referred, considered that those, who had been previously lieutenant-colonels, had a right to be protected? Was it not interfering with the regulations of the service which had previously existed?—The promotion for three years' service was a novelty altogether; in promoting a lieutenant-colonel because he had served three years in the field the interestsof all his senior lieutenant-colonels were lost; but I will just assume, for a moment, that that Commission had not existed, then if Sir Thomas Troubridge and the other officers had been made Queen's aides-de-camp at the time they would have had an undoubted right to be colonels before every lieutenant-colonel in the army.

844. (*Maj.-Gen. Rumley.*) You speak of the Queen's aides-de-camp only, not the distinguished service colonels, as I understand?—No, not the distinguished service officers. The Queen's aides-de-camp would have had an undoubted right to pass over every lieutenant-colonel.

845. (*Maj.-Gen. Russell.*) Were officers always made colonels when appointed Queen's aides-de-camp?—Yes, invariably, I believe.

846. (*Gen. Sir G. Brown.*) There have been exceptions, have there not. Do you remember the case of colonel Fox?—I do not, but, at all events, you call it an exception to the rule.

847. (*Maj.-Gen. Sir W. Brereton.*) I think, if you look in the *Army List* of 1813 or 1814, you will find five officers then serving as lieutenant-colonels who were aides-de-camp, and who had been serving for a long time in that position?—It may be so.

848. (*Chairman.*) If, even after the issuing of the new warrant on the 6th of October 1854, which gave the power of promoting for distinguished service in the field, until the 12th of December 1854, a brevet having come out after the battles of Alma, Balaklava, and Inkermann, promoting many captains to the rank of major, and many majors to the rank of lieutenant-colonel, not a single officer was promoted from the rank of lieutenant-colonel to that of colonel for distinguished service, would not you consider that a proof of what had been the custom and regulation of the service previously?—I really have no recollection of it; I had very little to do with the promotion room latterly while I was in the office, and my memory does not furnish me with any instance of a distinguished-service officer being promoted as such.

849. (*Gen. Sir G. Brown.*) Was the recommendation of the Commissioners of 1854 intended to protect the lieutenant-colonels then on the list from the operation of the prescriptive right of the Crown to promote officers as aides-de-camp, or only to protect them from the operation of the three years' rule?—I think to protect them simply from the three years' rule.

850. (*Mr. Bouverie.*) Not from the promotion of the distinguished service officers?—No.

851. That had not been thought of?—I do not recollect any cases of distinguished service colonels promoted as such, they were made Queen's aides-de-camp. Sir Thomas Troubridge, Colonel McMurdo, and several others, were made Queen's aides-de-camp; that was most likely for distinguished service.

852. (*Gen. Sir G. Brown.*) Would protection have been effectually afforded to them, by promoting the lieutenant-colonels on the list, either as their juniors respectively became qualified, or at dates three years subsequent to the dates of their lieutenant-

colonelcies?—The great protection which ought to have been accorded to the lieutenant-colonels not promoted by the brevet of June 1854, ought to have been, that any lieutenant-colonel, who was promoted to be a colonel after three years' service, should have pushed up every one of his seniors.

853. You have had very long experience at the War Office, can you tell me whether there is any instance, within your recollection, in which the dates of officers' commissions have been retrograded, that is, have been dated by retrogression, those officers being put down on the list?—Only as a punishment. I know of no other instance.

854. I ask the general question, whether it has been the practice at the War Office ever to do so?—It has not been at all the practice.

855. Is there any precedent for the prerogative of the Crown being used to such an extent as it was in 1858, by promoting a large body of officers by antedating their commissions, and by passing them over the heads of the officers who had been promoted in the interim?—I do not know of any such instance. There have been instances of antedated commissions being given to officers individually, upon their representations that they were unfairly treated, or something of that sort, but that was in individual cases only, to rectify an error

856. (*Mr. Bouverie.*) Not as a favour to the officers so antedated, but merely to set right what had been done wrong?—Merely to set right an error.

857. (*Chairman.*) You stated that Mr. Sidney Herbert drew out, or corrected, the warrant of 1854?—He did.

858. What position did he hold at the time?—He was secretary at war.

859. Afterwards, as Lord Herbert, or still as Mr. Sidney Herbert, I think he was the chairman of the Royal Commission of 1858, was he not?—He was.

860. And took part in the alteration which was then made?—Yes, but there is not anything in the Report of 1858, as I read it, relating to the aides-de-camp of the Queen, or to the injury done to them by the promotion of all those officers.

861. You consider then that he a second time overlooked the interests of a certain class of officers?—There is not an allusion to them in the whole of the Report of the Commission of 1858. I do not think there is a single word which bears upon it.

862. Although there is not a single word in the report did you see the evidence that was taken before that Royal Commission?—I did not read the evidence, if I had it. I wrote the letter, which is before you a day or two after Sir Thomas Troubridge wrote to me.

863. If you read the evidence you will find that several questions were put to the witnesses upon that very subject?—That may be, but in the report there is not a word about it. I only took the report. I only argued upon that report.

864. I understand that you argue that the case of those officers was overlooked by that Commission, because it is not mentioned in the report?—I do.

865. But the attention of the Commissioners must have been drawn to it, evidently, by several questions put in the examination of the witnesses, must it not?—Their attention ought to have been drawn to it.

866. Do you not consider that the two paragraphs in the report of the Commission of 1858, Nos. 66 and 67, relate to those distinguished officers: "By distinguished conduct in the field, the Commissioners of 1854 meant conduct so conspicuous as to justify a promotion so exceptional, and did not contemplate its application to the large numbers of officers, heads of departments, seniors of regimental ranks, &c. &c., to whom it has become customary to give a step by brevet, not only after general and even partial actions, but at the conclusion of military operations. Indeed, the granting of steps by brevet has had so little reference to individual service, that it has been held to be a slur on any officer occupying a certain rank or position to be omitted from the list." The report also includes a list of the officers, does not it?—It does.

867. And therefore it may be naturally inferred that their attention was drawn to that subject?—Yes.

868. (*Maj.-Gen. Rumley.*) Those officers were also distinguished, at page 49 of the Appendix, by having a D put after their names, were they not?—Yes, I imagine those are all Queen's aides-de-camp.

869. (*Chairman.*) There are two distinct batches; the first batch was made Queen's aides-de-camp, the second batch were promoted for distinguished service; then comes another batch of Queen's aides-de-camp, and then another batch of distinguished service officers, is not that the case?—Yes, but I was not before aware of this.

870. (*Maj.-Gen. Rumley.*) Those officers having been so marked, in the appendix which was attached to the report of the Royal Commission, do you still consider that there was an oversight on the part of the Commissioners with respect to their case?—I still consider that there was an oversight in the warrant of 1854.

871. I am speaking of the report of 1858?—I think there was an oversight of the injury that would be done to those aides-de-camp who had been promoted in the meantime.

872. Not to the distinguished service officers?—To them too, if they get their promotion specially, which I had supposed to be as Queen's aides-de-camp.

873. Do you consider it was an oversight of the Royal Commissioners?—I think it was an oversight in the report.

874. Notwithstanding that they are marked in the Appendix?—Notwithstanding that they are marked in the Appendix. At the time when I had this report I had, I think, no more sent to me by Sir Thomas Troubridge than the report itself.

875. (*Mr. Bouverie.*) May I ask the ground for your opinion, that there was an oversight on the part of the Royal Commission?—Simply that it is not noticed in the report. I think it has been stated in the papers that Lord Herbert himself was of opinion that it had been an oversight on his part.

876. (*Gen. Sir A. Woodford.*) Do you refer to the report or the warrant?—In both the warrant of 1854 and in the report of 1858.

877. (*Mr. Bouverie.*) Should you be disposed to alter your opinion, if you were assured by two members of that Commission that the matter had been considered, and fully considered, by them?—I should say that if it had been considered something with respect to it ought to have been stated in the report.

878. (*Chairman.*) There was no special application on the part of those officers before that Commission of 1858, was there?—That Commission was appointed to look into the injury done by the three years' promotion.

879. (*Maj.-Gen. Sandham.*) The object was to investigate the injury done by promoting the lieutenant-colonels previously to 1854, was it not?—Yes; it appears so.

880. (*Maj.-Gen. Rumley.*) Did I understand you to say that the brevet of the 20th of June 1854 included all those lieutenant-colonels who had completed their three years' service?—I think it included every lieutenant-colonel whom the Commander-in-Chief and Secretary-at-War thought of sufficient standing.

881. Would you like to refresh your memory by reference to any *Army List* of that date?—The promotion which took place on the 28th of Nov. 1854 included Colonel Charles Hagart, who became a lieutenant-colonel of the 31st of October 1851.

882. I speak of the brevet of the 20th of June 1854?—That went no further than Colonel Windham, who was a lieutenant-colonel of 1846.

883. I think you stated in your evidence that it included all those who had qualified up to that date?

—I meant the promotion of the 28th of November 1854.

884. You stated the 20th of June ?—Certainly, I did inadvertently say 20th June 1854, meaning all the promotions of 1854, but all the promotions of 1854 in no respect prejudiced the officers who would afterwards get promotion for distinguished service. They could not have been prejudiced in any way. Nothing prejudices them, and nothing puts them down, except the warrant of 1858 by promoting every lieutenant-colonel of June 1854.

885. (*Gen. Sir G. Brown.*) If the Commission of 1858 had recommended that all the lieutenant-colonels prior to June 1854 should take rank as colonels from the dates respectively of three years subsequent to the dates of their lieutenant-colonelcies, would not that have satisfied all the reasonable claims to protection ?—Yes, I think it would.

886. They had no reasonable claim to protection beyond that ?—No.

887. (*Maj.-Gen. Russell.*) Do you not think that some of the colonels, originally promoted on the 28th of November 1854, would then have claimed the three years from the date of their appointment as lieutenant-colonels ?—No, because they were promoted under a newly introduced system.

888. On the 28th of November 1854 the new system came in, and many of the colonels were then of seven years' standing ; would they not have been made colonels after the end of three years ?—In introducing altogether a new system you make an exceptional rule. Those long lists of colonels of 1854 could certainly not have been all promoted by three years' service as lieutenant-colonels.

889. No lieutenant-colonel promoted on the 28th of November 1854 had served less than three years, either in his regiment or on a staff appointment ; some of them had served nearly seven ?—That question does not at all affect the question that is now before you.

890. (*Maj.-Gen. Rumley.*) Do you demur to answer the question ?—What I mean is, that the promotions of 1854, whether they were for the three years' service or by a special brevet, do not at all affect the case of those officers who were made Queen's aides-de-camp in 1855-6, which is the case before the Commission.

891. There is something more besides the case of the Queen's aides-de-camp before us, namely, that of the distinguished-service colonels ?—The distinguished-service promotion granted by that warrant is a novelty as a general rule.

892. (*Maj.-Gen. Russell.*) The Gazette of 28th November 1854 says : "The under-mentioned officers "having completed three years' actual service as regi- "mental lieutenant-colonels, or in other appointments "equivalent to those situations, to be promoted to the "rank of colonel in the army, in accordance with the "provisions of Her Majesty's Royal warrant of the "6th October 1854, the commissions to bear date the "28th November 1854" ?—You are quite right, but I was not aware that all the promotions of 28th November 1854 were of that nature.

893. That was the first promotion under this new regulation ?—Yes.

894. Some of those officers, as I stated, were about seven years lieutenant-colonels ?—Yes, they were.

895. Would they not have claimed the benefit of the three years, had that been the rule throughout ?—Yes, but I should think not under a new rule.

896. (*Chairman.*) The report of the Royal Commission of 1854 was dated the 17th of June 1854 ?—It was.

897. And contained a recommendation that existing interests should be protected ?—It did.

898. But that recommendation would only extend to those who held the rank at that time ?—At that moment.

899. The brevet of the 20th of June 1854 was accompanied by a note, that the officers promoted by that brevet would be subject to the operation of the new warrant, although it was not then issued, was not that so ?—I do not understand what that could have meant, except to the then made lieutenant-colonels and majors.

900. In consequence of that note they were subject to the provisions of any new warrant ; that is all you understand by it ?—That is all.

901. Do you consider that that was a sufficient notification to all officers who should obtain their promotion afterwards, that they should be subject to a subsequent regulation ?—I do not know that it would be a sufficient notification to those that were not then promoted, but the moment the warrant came out there was a sufficient notification.

902. There were officers appointed between the 20th of June and the 6th of October who complained very much of that warrant having had a retrospective effect upon them, because it was not out at the time when they obtained their promotion ; it is quite evident, is it not, that that warrant would affect all those officers who were promoted under that notification ? — Unquestionably all those who were promoted then, but I do not know that such a notice as this in the Army List would affect any officers who were not then promoted, at least not until that warrant came out.

903. Would not the effect of that be, that the warrant was to have effect on the officers promoted on the 20th of June, but was not to have effect upon the officers who were promoted subsequently to them ?—There would be very few appointed subsequently to the 20th of June.

904. Our Commission says : "It has been repre- "sented to Us that certain captains and lieutenant- "colonels of the guards, who were promoted to that "rank between the 20th of June 1854, and the "issuing of the warrant of 6th October of that year, "consider that their positions in the army have been "unduly injured by the operation of the said warrant "of 6th October 1854, and also by the subsequent "warrant of 14th October 1858 ?"—I can hardly see that.

905. Because, previously to the issuing of the warrant of 1854, it did not require a certain length of service for a captain and lieutenant-colonel of the guards in order to become a colonel, which was rendered necessary by the warrant of 1854 ?—But they got their promotion before the date of the warrant, therefore I do not see how it could affect them in any way.

906. Other officers by that promotion were placed over their heads ?—The notification in the Gazette is only, in my estimation, sufficient for those officers who were afterwards mentioned ; that is to say, for those who were promoted at that time.

907. Colonel Carleton in his evidence says, "I "was promoted to a company of the guards, with the "rank of lieutenant-colonel, after 16 years' ser- "vice, on the 15th July 1854. I found myself, in the "month of January 1862, superseded by 165 officers, "of whom 14 were junior to me in every rank in the "service ?"—That is a question that I have not looked at at all ; I cannot give an opinion upon it, but it seems, under the former privileges of the guards, a hard case.

908. I think you have given a very decided opinion that the notification in the Gazette would apply only to those whose names appear in the same Gazette ?—For myself, I think it would apply only to the officers who are hereafter mentioned :—"Officers promoted "by the following brevet will receive their pro- "motions subject to new regulations." It does not say that all other officers not now promoted will be in the same position.

909. Hereafter to be promoted ?—Yes.

910. I think you began by saying that you thought the protection, recommended by the Royal Commission of 1854, was limited to those officers who held the rank of lieutenant-colonel previously to the 20th of June ?—Yes.

*J. Croomes, Esq.*

28 May 1863.

911. It would not extend to those appointed to that rank subsequently to that period?—No. For instance, a major may be promoted to be lieutenant-colonel by brevet, but when he becomes a lieutenant-colonel he cannot become a colonel now until he has served three years.

912. And you think that any officer appointed subsequently to the 20th of June 1854 would naturally be subject to that rule?—Certainly. There is one thing which I may mention. If the Commission of 1854 had recommended that every lieutenant-colonel of the 20th of June 1854 should be made a colonel, there would not have been a single lieutenant-colonel in the army. That is the spirit and action of the warrant of 1858, namely, that every lieutenant-colonel should be promoted.

913. With the exception of their being called colonels instead of lieutenant-colonels, it only retained them in their relative positions, it gave them no additional pay, did it?—It gave them only the name of colonel.

914. It gave them no additional pay, and kept them in their relative positions?—Yes.

915. But there was no period of service required in the rank of lieutenant-colonel to qualify for becoming a colonel, was there?—The brevet generally put up officers who had served three, four, or five years.

916. There was no rule requiring a certain service, was there?—No rule; it was an arbitrary matter between the Commander-in-Chief and the Secretary at War.

917. (*Maj.-Gen.-Russell.*) If all the lieutenant-colonels had been made full colonels on the 28th of November 1854, you stated, did you not, that there would have been no lieutenant-colonels in the army?—I say that if all the lieutenant-colonels of the 20th of June 1854 had been promoted by one brevet, there would have been no lieutenant-colonels left.

918. Would not there have been the 100 officers or so promoted at that very date. Those who became lieutenant-colonels on the 20th of June 1854 would have been lieutenant-colonels still?—Yes, but all those majors who became lieutenant-colonels on the 20th of June 1854, were promoted I think.

919. No, they were promoted subject to the provisions of the warrant about to be published, but which did not come out till October 1854, therefore you would have had as lieutenant-colonels in the army all the officers who were made lieutenant-colonels on the 20th of June, including all who were made up to the 28th of November 1854, that is 250 probably?—Yes.

920. (*Chairman.*) The warrant of 1858 did not take in those officers appointed lieutenant-colonels on the 20th of June 1854?—No, but several had become colonels by three years' service before 1858.

921. Therefore you were hardly correct in saying that, if they had made all the then lieutenant-colonels colonels, there would have been no lieutenant-colonels in the army?—No, I was not correct in that, and should have said except those appointed on the 20th June 1854, and before the warrant of 6th October.

922. (*Maj.-Gen. Russell.*) I believe there is no question as to the lieutenant-colonels promoted colonels on the 20th of June 1854; the only question is as to what has been done with those who were lieutenant-colonels previously to that date, and not then promoted, whether they should have been made colonels of the 28th of November 1854?—Some of those colonels who were dated on the 28th of November 1854 had had but a very short service as lieutenant-colonels. My strong feeling is, that the remedy for the promotion of the lieutenant-colonels would have been, that when a three years' lieutenant-colonel came to be a colonel he should have pushed up his seniors.

923. (*Chairman.*) That would not have protected those who were lieutenant-colonels from the officers superseding them for distinguished service, that is also a new regulation?—It would not, it would neither have protected them from the promotion of aides-de-camp nor of distinguished service officers.

924. They had been always subject to the promotion of aides-de-camp?—Yes, always.

925. To the promotion of distinguished-service colonels they had not been subject, that was a new rule?—Yes; it might have been held to be a grievance at first, and so might the promotion of aides-de-camp have been held to be at first, but it has never been admitted to be so.

926. (*Maj.-Gen. Russell.*) I understand you to have drawn a distinction, as to the protection to be afforded to the lieutenant-colonels of June 1854, between the protection from the three years' rule and the protection from the distinguished-service colonels, why did you draw that distinction?—I think the one is a very high honour conferred by the Crown.

927. It was equally new to the army with the three years' service, was it not?—It was new to the army.

928. Your distinction, then, is simply on the ground of the prerogative of the Crown?—I think that is a fair distinction there.

929. (*Maj.-Gen. Rumley.*) Some stress has been laid, I think, in the minds of the public, upon the fact that no consideration whatever was shown by the Royal Commission of 1858 to the case of the officers promoted Queen's aides-de-camp and distinguished-service colonels. In the pamphlet which I hold in my hand, and which I see bears your signature, I read this paragraph, "The Commissioners of 1858, no doubt inadvertently, paid no consideration whatever to the cases of the officers, who, in 1855-56 had been specially selected by the Sovereign for distinguished service, or as Queen's aides-de-camp. There is not in the report even an allusion to them." Now, taking up the report, and reading paragraph 66, I find these words, "By distinguished conduct in the field the Commissioners of 1854 meant conduct so conspicuous as to justify a promotion so exceptional, and did not contemplate its application to the large number of officers, heads of departments, seniors of regimental ranks, &c., &c., to whom it has become customary to give a step by brevet, not only after general and even partial actions, but at the conclusion of military operations. Indeed, the granting of steps by brevet has had so little reference to individual service, that it has been held to be a slur on any officer occupying a certain rank or position to be omitted from the list." I should like to ask you whether, notwithstanding this paragraph in the proceedings of this Royal Commission, you think that their case has been overlooked?—I think the case of the aides-de-camp had been overlooked, but I wrote under the impression that all lieutenant-colonels promoted for distinguished service had been made Queen's aides-de-camp.

Vide Appendix, page 54.

930. You have mixed the distinguished service colonels with the aides-de-camp in your paragraph?—I ought to correct that, so far as to say that there has not been an allusion to the Queen's aides-de-camp.

931. I think you stated, in answer to a question just now, regarding the prerogative of the Queen, that it was very unusual to promote so large a number of officers at one time as was the case in promoting these officers, and antedating them to the 28th of November 1854; you answered that affirmatively, did you not?—Yes.

932. Was not it an unusual circumstance also to promote officers who had been lieutenant-colonels only five months to be Queen's aides-de-camp?—It was a prerogative of the Crown.

933. They are both prerogatives of the Crown. The former question preambled that it was the undoubted prerogative of the Crown to promote officers, and then asked whether it was not unusual to group so large a number together and antedate them, as was done, to the 28th of November 1854. In like manner I wish to put my question, preambling the undoubted prerogative of the Crown, whether it is not an unusual thing to promote officers to be Queen's aides-de-camp after only five months' service as lieutenant-colonels?—It was not a very usual thing, I admit;

but, although it was not usual with five months' service, it had been usual with short service to make an officer a colonel by making him an aide-de-camp.

934. Can you tell me the shortest service after which an officer has attained to that rank?—No, I could not without a very rigid examination of the Army List. I think the words "distinguished "service" should certainly be taken out of that paragraph of mine, as it was used with reference to the past.

935. (*Chairman.*) Then you do draw a distinction between Queen's aides-de-camp and officers promoted under the new warrant for distinguished service?—I am wrong in this paper in saying that there is no allusion whatever in the report of the Commission of 1858 to the officers promoted for distinguished service under the warrant of 1854. There is an allusion to it. I am decidedly wrong there.

936. (*Maj.-Gen. Rumley.*) Taking you on then to the Appendix to these proceedings of the Royal Commission of 1858, wherein the names of certain officers are given who had been promoted as aides-de-camp, and for distinguished conduct, let me ask, are the aides-de-camp not included and named in that list?—As I have said, I never saw this Appendix to the report.

937. But seeing it now, do they not appear to be distinguished there from others by a D prefixed to their names?—The D is put against those who are made Queen's aides-de-camp, and also against those promoted for distinguished service.

938. So that there is a distinction made in that list betwen them and other officers promoted?—Yes, but there is no distinction as to whether they were promoted as aides-de-camp or as distinguished-service officers, but there is simply a letter D in both cases.

939. Again I must come to this little memorandum of yours in which you say that "the Commissioners of "1858, no doubt inadvertently, paid no consideration "whatever to the cases of the officers, who, in 1855–"56 had been specially selected by the Sovereign for "distinguished service, or as Queen's aides-de-camp," whereas in that Appendix there is a letter D after their names?—As I say, I never saw this Appendix.

940. This pamplet was written when you had not seen that Appendix?—Yes; I still think that as the report does not say one word about the aides-de-camp, their cases were not considered by the Commissioners.

941. (*Maj.-Gen. Sandham.*) Do you refer to the warrant or to the report?—To the report of 1858.

942. (*Chairman.*) Having now seen the Appendix, you alter the opinion you expressed in that pamphlet, to this extent, that the case of the officers appointed Queen's aides-de-camp was not considered by that Commission, but that the case of the distinguished-service colonels was?—There is an allusion to the distinguished-service colonels, that is all I mean, in the 66th paragraph. That paragraph does not go to the length of any recommendation; it says, "By "distinguished conduct in the field, the Commissioners "of 1854 meant conduct so conspicuous as to justify a "promotion so exceptional;" I certainly overlooked that.

943. (*Maj.-Gen. Rumley.*) You overlooked that when you wrote your pamphlet?—I ought not to have said that there was no allusion whatever to distinguished conduct; my words are, "There is not in "the Report even an allusion to them," referring both to the Queen's aides-de-camp and to the officers selected for distinguished service. Now I find that there is an allusion to the latter class of officers, but it is only an allusion, and refers to the new rule of the warrant of 1854.

944. You say "It is much to be regretted that "what, with all respect for the Commissioners, must "be deemed the injudicious and unjust measure"?—I think it was an unjust measure myself "of giving to "every lieutenant-colonel commissioned prior to the "20th June 1854 his standing on the list of colonels "(whether he had been intermediately promoted or "not) according to his standing as lieutenant-colonel in "1854," because by that measure you prejudiced the eight Queen's aides-de-camp; that was in my particular view; I mean the Queen's aides-de-camp who had been previously promoted.

945. (*Maj.-Gen. Russell.*) Then you entirely disagree with the recommendation of the Commissioners of 1858; clause 34 in the report of that Commission says: "We think, therefore, that it is a matter "of regret that the interests of these officers were "not more unmistakeably guarded by extending the "special brevet then given to all the lieutenant-"colonels dating prior to the 20th June 1854. There "being no difference of pay between the ranks of "colonel and lieutenant-colonel, the extension would "have cost the public nothing"?—Yes, I cannot help thinking that the Commissioners of 1858 did not see what would be the effect of the promotion of every officer up to the 20th of June 1854, according to his date as a lieutenant-colonel. I have not the least objection to that promotion, but I think it was injudicious to place them in the rank which they held as lieutenant-colonels in 1854. Now, there is this curious fact about it, Colonel McMurdo was made an aide-de-camp long after Sir Thomas Troubridge, but he stands now a great deal above him.

946. He has resumed his original position which he held as lieutenant-colonel when Sir Thomas Troubridge was a major?—Yes.

947. (*Maj.-Gen. Rumley.*) He was the senior lieutenant-colonel?—Yes.

948. Had you any particular reason for the opinion which you expressed in your pamphlet, that in framing the 8th clause of the warrant Mr. Sidney Herbert took the wording of paragraph 125 without considering the strong recommendation of clause 52?—He has himself admitted it, as I understand.

949. To you?—No, not to me, but he has applied, as I understand, for some mode of rewarding those officers, having admitted his oversight.

950. It was nothing that took place in the office while you were superintending the correction of the warrant which leads you to say that?—No. I left in 1857, and the complaint was not investigated till 1858.

951. There is another little paragraph in your pamphlet: "The arrangement of 1858 has, in fact, "entirely cancelled the honour and reward of special "early promotion which Her Majesty intended to "confer upon the selected officers of 1855–56." It has not cancelled the honour, surely, of being an aide-de-camp?—It has cancelled the commission of a man, and taken away from him all advantage that was intended to be given him. Appendix, page 55.

952. It has not cancelled the honour, has it?—It has cancelled the reward.

953. You say "the honour" in your pamphlet?—I believe I may say that the position of an officer on the list is honourable.

954. You have stated that it has "cancelled the honour and the reward"?—It has cancelled the honour and reward, because it has deferred his promotion to the rank of major-general.

955. Surely the appointing these officers aides-de-camp, and leaving them in their present position, has taken them above several officers who were senior to them already?—It has unquestionably cancelled the reward of special early promotion, because those officers will not obtain promotion so early as they would if they had stood as they did in 1855.

956. I think you have admitted "that the protec-"tion promised by the Commissioners and by the "warrant was not afforded"?—Yes.

957. And you are of opinion that "there may be, "and there are probably, many difficulties in now "doing full justice to these distinguished officers, by "placing them in the places they ought to hold in "the list of colonels"?—Yes, I think there may be

*J. Croomes, Esq.*

8 May 1863.

a difficulty, but I think that the right way would be to give them their position immediately after the officers who became, by three years' service, colonels before them.

958. (*Maj.-Gen. Russell.*) Do you include both Queen's aides-de-camp and the officers promoted as distinguished-service colonels?—I can hardly make a distinction myself.

959. The one is an old-established mode of promotion?—The one is an old-established custom and the other is a novelty, I admit, but I can hardly make a distinction, because it is an act of favour.

960. They having attained their present position on the list without prejudice to the colonels of 1854, have they not, under the new warrant, an opportunity of being selected for employment with increased rank; is not that another advantage which they enjoy under the new warrant, no matter what their position on the list of colonels may be?—The position which Sir Thomas Troubridge assumes on this list is, I think, the one which he ought to hold.

961. I speak of the class of officers consisting of aides-de-camp and distinguished-service colonels?—I only mentioned Sir Thomas Troubridge as the first aide-de-camp. I say that he and those appointed in May and June 1855 should stand before those who became by service colonels in July 1855.

962. Standing where they now do on the list, has not the Commander-in-Chief the authority granted by the new warrant to select those officers for employment with increased rank; is not that an advantage which they still possess. Any colonel on the list may be selected for employment with the rank of major-general, giving him the precedence of his senior colonels?—I think the Commander-in-Chief has that power.

963. Granted under the new warrant?—Granted under the new warrant. One of the matters I mentioned in the pamphlet is this: "The Commissioners "were, however, very regardful of the interests of "the colonels who had been promoted, for dis- "tinguished service, to be major-generals. They "were to be supernumeraries of their rank, until, by "regular succession as colonels, they were to come "on the fixed establishment of major-generals; but "they were from that time to take rank, not as last "on the list, but according to the dates of their "supernumerary commissions, with a view to earlier "promotion to lieutenant-general."

964. (*Maj.-Gen. Rumley.*) That does not answer the question, does it?—In this respect, it enables the Commander-in-Chief to place those officers as lieutenant-generals earlier than the colonels who were promoted as such before them.

965. (*Maj.-Gen. Russell.*) My question is, has not the power of selection conferred under the new warrant given the Commander-in-Chief the means, if he pleases to exercise it, to employ those officers in the rank of major-general at any time?—Yes, he has the power.

966. No matter what their position may be?—Yes, with the temporary rank of major-general, but with that only.

967. Which may be confirmed under certain conditions expressed in the warrant?—Yes.

968. (*Maj.-Gen. Rumley.*) That is one of the advantages which has not been cancelled; it is not one of the honours and rewards which have been cancelled?—No.

969. (*Maj.-Gen. Russell.*) With regard to being supernumerary on the list, is not there this difference between the major-generals' list and the colonels' list, that the one is a fixed establishment and the other has no limit?—There is that difference, the one is a fixed establishment and the other is not, but, by parity of reasoning, only the Queen's aides-de-camp who have been superseded by so many colonels should be treated in the same manner as the major-generals with temporary rank.

970. (*Maj.-Gen. Rumley.*) In paragraph 86 of the report of the Royal Commissioners of 1858, they say, "By an order dated the 1st of May "1855, it was announced that the rank of colonel "should be given to officers holding the rank of "brevet lieutenant-colonel for service in the field, so "soon as a period of six years of actual service should "have elapsed since their obtaining such brevet rank "or that they might have the option of a step of sub- "stantive unattached rank above their then regimental "rank, if the convenience of the service would "admit." Then there is a memorandum in the Appendix, dated War Office, May 1st 1855, which says, "Her Majesty has been graciously pleased to approve "of the rank of colonel being given to officers who "obtain the rank of brevet lieutenant-colonel for ser- "vices in the field after the period of six years' "actual service with that rank, and that they may at "once have the option of a step of substantive un- "attached rank where the convenience of the service "will admit of it?"—I know little of that memorandum, I might have read it, but I was at that time in the Secretary of State's office in Whitehall Gardens.

971. Were you aware of the terms of that warrant?—I did not pay any attention to those affairs at that period; I had quite enough to do with the Turkish contingent, and other levies and duties.

972. Were you aware of it at the time when you were considering the case of the distinguished-service colonels?—No, I was not.

The witness withdrew.

Adjourned.

REFORM CLUB PALL MALL

# APPENDIX.

MEMORANDUM handed in by

Major-General the Hon. JAS. LINDSAY.

THE claims of the officers promoted in 1855 as aides-de-camp to the Queen, and to the rank of colonel for distinguished service in the Crimea, are little understood by the public; they have been recently commented on by portions of the press, but the writers having been evidently misinformed as to the places these officers really seek, and the grounds on which they seek them as an act of justice and fair play, it has now been thought desirable to publish this statement and the accompanying lists.

In 1854 a Royal Commission recommended that the system of promotion to the rank of colonel should be altered:—

That lieutenant-colonels in command of regiments, and in certain staff appointments, should obtain the rank of colonel in three years; but that the existing interests of those already lieutenant-colonels before June 1854 should be carefully protected from injury.

The protecting clause was omitted in the Royal warrant; the effect of which was that the lieutenant-colonels who had served three years in a substantive capacity were promoted over those who were not so employed, such as those on half pay, or brevet lieutenant-colonels, or captains and lieutenant-colonels of the guards.

It was felt that the mode in which the new rule had been carried out was unjust to officers who had previous to its issue obtained the rank of lieutenant-colonel, and the Commission of 1858 was appointed to consider their case.

It is evident that if, when the rule was first promulgated, all existing lieutenant-colonels had been protected and placed upon an equal footing, and promoted to the rank of colonel after three years' service in the rank of lieutenant-colonel, none of them could have complained of the rule, or could by possibility have been injured by it.

The Commission of 1858, instead of proposing this mode of rectifying the injustice, from some misapprehension of the case, and unaware (as has been distinctly stated by the late Lord Herbert the president, and other members of the Commission) that the officers promoted in the interim by the Queen for service in the field in 1855 would be injuriously affected by their recommendation, proposed that all lieutenant-colonels previous to June 20th 1854 should be given the rank of colonel, antedating the rank to November 1854, the day on which the new three years' rule had first been acted upon.

The two methods would have been identical in their effect, if there had been no war in the interval, and no officers promoted for service in the field; but as these events occurred this difference has arisen.

By the first course—viz., promoting every lieutenant-colonel on the completion of three years' service—justice would have been done to the officers passed over under the "three years' clause," with the smallest amount of injury to the colonels specially promoted for service; whereas by the antedated brevet these officers have been seriously and unnecessarily injured, some of them having lost the whole of the advantages of their special promotion, and occupying now the same places they would have held had they remained at home instead of serving in the Russian war.

In the comments upon this subject which have appeared in print, many irrelevant topics have been introduced; such as the services in India in 1857 and 1858 of officers who would lose a few places by the proposed changes; the length of service of the colonels promoted in 1855, &c.

Sir Charles Yorke's Committee in 1861 reported against any disturbance of the list, but on reference to their report it will be seen that they did not argue the case on its merits or its justice, but based their recommendation on the grounds that the decision of a Royal Commission (that of 1858) should be final, whereas the Commission of 1858 was only convened for the purpose of reconsidering the decision of the Royal Commission of 1854.

The late Secretary for War, after a deliberate consideration of these claims, came to the conclusion that they were just, and by a letter, dated the 8th November 1862, he, with the concurrence of the Commander-in-Chief, decided the question in their favour. This was announced by the Under Secretary of State, to one of the officers concerned, on the 4th of January in the present year; since which time the concurrence adverted to has been withdrawn by a letter of the military secretary of 7th February 1863, no reasons having been assigned.

What is now asked for is the appointment of a Royal Commission to consider the claims of these colonels.

The accompanying lists show the exact places held by these officers up to November 1858, the places they now occupy, and the intermediate places claimed.

EXTRACT from ARMY LIST of OCTOBER 1858,

Showing the Positions occupied by the 21 Colonels in question before the antedated Brevet—they are denoted by asterisks.

Colonels who have since become non-effective are omitted.

Colonels Gordon and Chapman, having been specially promoted to the rank of colonel in 1855, ought to have been promoted to the rank of major-general on the two last vacancies instead of Colonels Stehelin and Walpole, who had not completed three years' service as lieutenant-colonels till 1856, as shown above.

NOTE.—The officers whose names are printed in italics are those who were passed over under the three years' clause, and who in 1858 were the only complainants. In the first list only four of these stand above Sir Thomas Troubridge; in the second list 71; the difference is 66, of which it is admitted that 40 (down to Col. Irwin) have a fair claim to be colonels of dates *prior to the 18th May* 1855, and therefore to stand before Sir Thomas Troubridge; but at present 26 complainants, who only asked for their former *relative* positions with reference to the three years' clause, and many other colonels, from Adams to White inclusive, also stand before him and they have no claim to be colonels before the Queen's aides-de-camp, and colonels promoted for distinguished service, were selected.

JAS. LINDSAY, Major-General.

## Mr. CROOMES' MEMORANDA handed in by Colonel Sir THOMAS TROUBRIDGE, Bart.

MY DEAR SIR, Henley, 12 November, 1861.

AFTER reading carefully the papers you sent me, I felt it a duty to state, in my own way (inflicting upon you the prolix tediousness of an old man), what appeared to me important to prove the wrong which you and the other distinguished officers sustained by the warrant of 1858. I think, with you, that Mr. Sidney Herbert, in framing the warrant of 1854, looked principally at the summing up at the end of the Report, without sufficiently considering the protection promised by the 52nd clause.

The Commissioners of 1858 have misconstrued the words "general brevet," as an intention on the part of the Commissioners of 1854 to promote every lieutenant-colonel of, and prior to, the 19th June, 1854; but the intention of that Commission is to be found in the proceedings which were immediately adopted by the two official members of the Commission, Lord Hardinge and Mr. Sidney Herbert, by the grant of an immediate brevet, not for all, but for such portion only of the then existing lieutenant-colonels as they thought were justly entitled to such immediate promotion. The warrant subsequently promulgated promised brevet promotion for the remaining field officers, but unfortunately without pointing out the manner in which, by such brevet, the interests of the remaining lieutenant-colonels were to be protected by promotion when a junior was to be passed up.

If the Commissioners had intended the general brevet to include every recently appointed lieutenant-colonel then existing, the Commander-in-Chief and Secretary-at-War would have been bound to carry out the intention of the Commissioners to the full extent, and in that case you and your companion aides-de-camp would have had no cause of complaint; but this was not done, and very properly, as the remaining regimental lieutenant-colonels were required to establish their claims to promotion by three years' full-pay service in command.

The warrant which prescribed such service promised also brevet promotion, and at the same time admitted the right of the Crown to promote specially, by selection, as Queen's aide-de-camp, or for distinguished service in the field.

You and your companions so specially promoted,† have sustained an undoubted injury by loss of position, under the indiscriminate promotion by antedate made in 1858.

By the pamphlet sent to me, you seem to admit the justice of the promotions which ought to have taken place whenever a lieutenant-colonel by service had, before your appointments, passed over his senior officers; and this, I think, was the real protection which the Commissioners of 1854 intended, and which it is to be regretted was not carried out from time to time.

Sincerely yours,

Sir Thomas Troubridge, Bart. JOHN CROOMES.

12 November 1861.

The Commissioners of 1854, with a view of securing for the future a more efficient list of general officers, proposed that all lieutenant-colonels who had served a certain period in command of their regiments or on the staff should have the rank of colonel, and that from and after the 20th June 1854, general brevets should be abolished.

The 52nd clause of the Report is that showing most clearly the views of the Commissioners.

They said:—"We are however aware that if this system "were at once substituted for that which has been hitherto "in force, without adopting some means to protect the "interest of those whose prospects would be affected by the "change, much injustice would be inflicted on many officers "who have relied on the continuance of the present regula-"tion" (viz., promotion by seniority, but by uncertain periodical brevets). "We are of opinion that a liberal view "ought to be taken of the claims of those officers, and that "in introducing the change which the public good requires, "they ought to be carefully protected from injury, and from "having their *just expectations** di sappointed.

"We would therefore humbly recommend to your "Majesty that before our suggestions are adopted, a general "brevet should be granted, and also that the regulations we "have proposed, limiting the advancement of lieutenant-"colonels to the rank of colonel to those only who have "served three years in command of a regiment or in staff "situations, as already described, should not apply to "existing lieutenant-colonels, or majors, or captains, "lieutenant-colonels of the guards."

The 125th clause briefly sums up the recommendations of the Commissioners, thus:—

1st. That officers actually serving with the rank of lieutenant-colonel in command of, or as second lieutenant-colonel of regiments, as mounted officers of the guards, field-officers of the Royal artillery and engineers, or on the staff in situations necessarily held by lieutenant-colonels for three years, be given the rank of full colonel.

2nd. That existing field officers be allowed to rise *by brevet as under the regulations now in force*, but no

* These just expectations will be noticed.

† The words, "*before any brevet took place*," omitted at request of Mr. Croomes.

officer not now in the rank of field officer to rise from the rank of lieutenant-colonel, otherwise than by three years' service in the former rank, or *as a reward for distinguished service, or, as now, by appointment as Queen's aide-de-camp.*

It is now necessary to state what were the *just expectations* of the then existing lieutenant-colonels. They looked for promotion by absolute seniority, as they then stood on the list, whenever it was thought expedient to grant the brevet. This was a just expectation, but in my experience it had not been the practice that every lieutenant-colonel, however recently promoted to that rank, should expect almost immediate promotion.

They had relied on the continuance of the then existing regulation, which usually left them a few years in the rank of lieutenant-colonel, not liable to be superseded by their juniors, except in the case of officers selected by the Crown as Queen's aide-de-camp, or* of officers specially promoted for distinguished services.

The only protection they required was that their juniors, when by three years' service they had obtained the rank of colonel, should not pass over them; and if the just principle had obtained of promoting all above the newly promoted colonel, he being the last on the list, no complaint could have arisen.

I now refer to the construction placed upon the report of 1854, by the chairman of that Commission, who as Secretary-at-War, prepared the warrant of 1854.

The report of the Commissioners was dated the 17th of June 1854. On the 20th June 1854, it was notified to the army, that all officers appointed lieutenant-colonels on or after that date must serve three years upon prescribed full-pay to obtain promotion as colonel, and that general brevets were for them prospectively abolished.

On the 20th June 1854, a brevet promoted all the lieutenant-colonels who under the existing brevet system had a just expectation of such promotion, but left those of more recent date to be dealt with as circumstances might arise.

It is therefore quite clear to my mind that Lord Hardinge, the Commander-in-Chief, and Mr. Sidney Herbert, both members of the Commission, considered that they thereby fully carried out the views of the Commissioners as to the general brevet recommended.

By the 8th clause of the warrant subsequently promulgated, it is stated that "field-officers commissioned as such before the 20th June 1854," (the brevet of the 20th June having disposed of every lieutenant-colonel, who at that time had a fair claim to be colonel,) "be allowed to rise by brevet as under the regulations then in force, viz. occasional periodical brevets; but no officer promoted to the rank of field-officer on or after that date is to rise from the rank of lieutenant-colonel to that of colonel otherwise than by three years' service in the former rank, or as a reward for distinguished service, or by appointment to be Queen's aide-de-camp."

It is within my knowledge that Mr. Sidney Herbert himself prepared the first 14 clauses of the warrant, and I am of opinion that in framing the 8th clause he took the wording of the paragraph of the 125th without considering the strong recommendation of the 52nd clause of the report, that the interests of the then existing lieutenant-colonels should be protected. The warrant merely says they were to be allowed to rise by brevet as under the existing regulations then in force, but the 52nd clause of the report, which I here repeat, says, "We are of opinion that a liberal view ough "to be taken of the claims of these officers, and that in introducing the change which the public good requires, they "ought to be carefully protected from injury and from having "their just expectations disappointed."

The warrant promised them future brevet promotion (all the lieutenant-colonels then considered entitled by Lord Hardinge and Mr. Sidney Herbert having been promoted on the 20th June 1854), but no brevet took place, and no protection for the injury they suffered by many supersessions was afforded.

The absorbing events of 1854, 1855, and 1856 diverted the attention of the Commander-in-Chief and Secretary-at-War, from the disappointment which so many lieutenant-colonels had suffered, but even the warrant had promised them future brevet promotion, and I know that Mr. Sidney Herbert subsequently felt the injustice they had sustained, and that he advocated that whenever a lieutenant-colonel had, by three years' service, obtained under the new warrant, a right to promotion, all his senior lieutenant-colonels should be promoted before him, either with the same date or with an antedate. This would have injured nobody. The lieutenant-colonel who by service had obtained promotion, would have benefited himself without injuring his seniors, and thus gradually the list of lieutenant-colonels existing on the 20th June 1854 would have been absorbed in the rank of colonel.

If in 1854 every lieutenant-colonel had been made a colonel, including those serving with their regiments, the three years' service required for promotion would have been a mere fiction as far as they were concerned.

Nothing, however, having been done from 1854 to protect the interest of these superseded officers, their complaints of the loss of their position were forced upon the notice of the authorities, and in 1858 a further Commission was appointed to investigate their grievances.

By the report of that Commission, it appears that the cases of the colonels who had been promoted for distinguished service, to be major-generals, were first considered. There is a pecuniary advantage in the promotion from colonel to major-general, but there is also a prospective advantage in advancement in rank according to the date of such promotion. Promotion to rank of colonel gives no immediate pecuniary advantage, but by the date of colonelcy it secures promotion to the rank of major-general, with its pecuniary advantage and future progress in rank.

The Commissioners of 1858 recommended that the colonels who had been promoted to be major-generals for distinguished service should be supernumerary to the list of major-generals, until, by the regular succession according to their dates as colonels, they should in their turn come upon the fixed list of major-generals, at which period they should take their rank in the list, according to the dates of their original appointments as supernumeraries, and thus become lieutenant-generals, before those who were placed upon the fixed general officers' list whilst they were supernumerary.

By this the pay of general officer is secured from the date of appointment as supernumerary major-general, but the right of promotion to the rank of lieutenant-general is reserved to him according to the date of his first appointment as a supernumerary major-general.

In looking at the injuries inflicted upon certain lieutenant-colonels by the operation of the warrant of 1854, they recommend the simple but wholesale measure of placing on the list of colonels, every colonel and lieutenant-colonel whose commission as lieutenant-colonel was dated before the 20th June 1854, in the order in which they stood as lieutenant-colonels on that day.

It may be fairly assumed as certain that the commissioners of 1854 did not, by recommending a general brevet, contemplate so sweeping a measure.

This may be fairly inferred from the extensive brevet made by the joint concurrence of Lord Hardinge and Mr. Sidney Herbert, the most influential members (from their official position) of the Commission, and from the warrant of 1854 having promised brevet promotion to those lieutenant-colonels who then remained on the list of lieutenant-colonels with commission dated prior to the 20th June 1854.

It is much to be regretted that what, with all respect for the Commissioners, must be deemed the injudicious and unjust measure of giving to every lieutenant-colonel commissioned prior to the 20th June 1854, his standing on the list of colonels (whether he had been intermediately promoted or not) according to his standing as lieutenant-colonel in 1854, was recommended and adopted.

The Commissioners of 1858, no doubt inadvertently, paid no consideration whatever to the cases of the officers, who, in 1855–56, had been specially selected by the Sovereign for distinguished service, or as Queen's aides-de-camp.* There is not in the Report even an allusion to them. It may therefore be fairly assumed that they and their interests were entirely overlooked.

The prerogative of the Crown to select such officers for special promotion, is not disputed. Individual officers may, by having been superseded, have felt such selections as a personal grievance; but no instance has, I believe, occurred, of having all the officers whom the selected officer passed over, placed by a subsequent act above him on the list by an antedate of their commissions.

The injured lieutenant-colonels had no right to complain, and did not complain, that the Queen, in the undoubted exercise of her authority, had specially honoured and rewarded certain officers; but they did complain, and with justice, that they had been passed over by their juniors, under a warrant, which, while it established a new rule of promotion, promised them protection, but had not afforded it to them.

The Commissioners of 1858 could have repaired this wrong, without at the same time ruining the prospects of Sir Thomas Troubridge and others. When these officers

* Corrected by Mr. Croomes in his evidence before the Commissioners —Answer to Question 934.

* Corrected by Mr. Croomes in his evidence before the Commissioners —Answers to Questions 929 to 943.

were so honourably selected, the warrant had only injured a few of the lieutenant-colonels, but all the lieutenant-colonels of 1854 are now placed on the list before the selected officers by a general antedate.

The arrangement of 1858 has, in fact, entirely cancelled the honour and reward of special early promotion which Her Majesty intended to confer upon the selected officers of 1855, 1856, and has, I submit, in their case, interfered with the prerogative of the Crown.

As the Commissioners of 1858 had not foreseen the effect of their proposal upon Her Majesty's aides-de-camp, it may be fairly assumed that the Secretary of State for War had, in like manner, overlooked it. But this sweeping universal measure of placing every lieutenant-colonel of, and prior to, 19th June 1854, on the list of colonels, as they stood on the list of lieutenant-colonels on that day, has so deteriorated the position of Her Majesty's aides-de-camp, &c. &c., that I feel persuaded that if this effect had been explained or known to Her Majesty, her sense of justice and regard for her prerogative would have induced her to withhold her approval.

I have endeavoured, and I hope satisfactorily, to prove that the Commission of 1854, and the warrant consequent upon it, did not contemplate an immediate and indiscriminate promotion of every lieutenant-colonel then commissioned, some of whom had only in that year obtained their rank of lieutenant-colonel; but that ample justice was, at the time, done to the then existing lieutenant-colonels by the brevet promotion, which, in the opinion of Lord Hardinge and Mr. Sidney Herbert, was all that was required.

These public officers had but recently returned from the discussions of the Commissioners, and must be presumed to have acted according to the views of the Commissioners generally.

By the warrant of 1854, there was a promise of brevet promotion for the remaining lieutenant-colonels.

That the protection promised by the Commissioners and by the warrant was not afforded, is admitted; and this was the grievance of the lieutenant-colonels.

Although it might be argued that the Queen's aides-de-camp, &c., appointed colonels after the warrant of 1854, had at that time an undoubted right to expect that they might, from time to time, retain the position on the list of colonels, to which they were then appointed (the warrant of 1854 distinctly recognizing the right of such selection), there had been, by the neglect of the authorities, a want of consideration for the interest of the unemployed lieutenant-colonels who had been promised the protection of occasional brevets, by not promoting those who were senior to a lieutenant-colonel, who, by the prescribed full-pay service, had obtained the rank of colonel.

It would, therefore, be but a mere act of justice on the part of the selected colonels, to admit the claims of all those lieutenant-colonels who ought to have been, but were not, advanced in rank when their juniors, by the new regulation, superseded them, the promised brevet promotion not having taken place. This concession, for all who ought to have been promoted before their own selection, I infer from the pamphlet sent to me, the selected officers are willing, and I think fairly, to yield; but they appeal with great justice against the indiscriminate promotion of every lieutenant-colonel of June 1854, by an antedate, which entirely destroys the honour and the advantages (prospectively) which the Queen intended to confer.

It was deemed difficult to repair a wrong inflicted upon certain lieutenant-colonels, by the promotion of their juniors over their heads, but although the injury had continued under a Royal warrant (by the neglect of the authorities to afford them that protection which the warrant sanctioned), it was not considered inexpedient, after three years, to repair that injury; but in so doing, a very serious injustice was inflicted upon very distinguished officers honourably selected by Her Majesty, whose prospective views are materially prejudiced. Equal justice requires that this injury should be repaired.

There may be, and there are probably, many difficulties in now doing full justice to these distinguished officers, by placing them in the places they ought to hold in the list of colonels.

The Commissioners of 1858 said that the promotion of lieutenant-colonels, to be colonels, cost the public nothing, and without any reference to the position of the Queen's aides-de camp, promoted the whole of the lieutenant-colonels of June 1854; but instead of giving to each a date when the promotion of their juniors, by three years' service, had entitled them, under the warrant, to be protected by anterior or brevet promotion (as promised), they made every lieutenant-colonel of 1854 a colonel, with a four-years' antedate. This, by an oversight, or by a wrong construction of the intentions of the Commission of 1854, is the source of the injury to the aides-de-camp.

The Commissioners were, however, very regardful of the interests of the colonels who had been promoted, for distinguished service, to be major-generals. They were to be supernumeraries of their rank, until, by regular succession as colonels, they were to come on the fixed establishment of major-generals; but they were from that time to take rank, not as last on the list, but according to the dates of their supernumerary commissions, with a view to earlier promotion to lieutenant-general.

By parity of reasoning, Her Majesty's aides-de-camp should (if not replaced on the list, as they ought to be, and as they stood for three years) be placed, with reference to future promotion, immediately after those colonels who obtained their rank before them, and by so doing, breveted, or ought to have breveted, their senior lieutenant-colonels.

This would secure the promotion of all those appointed in May and June 1855, before Colonel Adams, who became colonel by service on 16th July; those appointed on the 17th July, before Colonel Brunker, who qualified on 24th August; and so on through the list, but this would be but a slight compensation for the loss of position they held until the warrant of 1858.

JOHN CROOMES,
Late Chief Clerk, War Office.

---

## STATEMENT of
## Colonel Sir THOMAS TROUBRIDGE, Bart.
## (Received 25 May 1863.)

In the report of the Royal Commission of 1854 a new rule of promotion to the rank of colonel was recommended for adoption in lieu of the old system of periodical brevets, viz., that all lieutenant-colonels should in future rise by service alone—by three years' service in certain qualifying situations. It was, however, felt that the existing interests of field officers who had purchased or obtained their promotion subject to no such restriction "ought to be carefully "protected from injury," and it was therefore recommended that a general brevet should be granted which would remove from the possibility of injury many of the senior lieutenant-colonels then on the list; and, moreover, that the proposed new rule "should not apply to existing lieutenant-colonels, &c."

Report of 1854, par. 42.

Par. 52.

Brevet of 20th June 1854, including lt.-cols. of 1846.
Par. 52.

This distinct recommendation was, however, not carried out. The report was signed 17th June 1854, but no warrant appeared until the 6th October 1854. The news of the battle of the Alma received in the latter part of September rendered it desirable that the proposed system, under which younger colonels would be available, should be introduced at once. Mr. Ramsay, secretary to the Commission of 1854, has stated that Lord Hardinge was most anxious for the appearance of the warrant, and pressed the Secretary at War (the late Lord Herbert) to prepare it as soon as possible. Mr. Croomes, late chief clerk at the War Office, states that the first 14 clauses of the warrant were prepared by Lord Herbert himself; the 7th and 8th clauses introduce the new system, but all mention of protection to existing interests is omitted. On reference to the report of 1854 the accident to which this omission is due becomes apparent. In the latter part of par. 124 it is said, "We now proceed shortly to re-"capitualte the whole of the recommendations, &c" Sections 1 and 2 of par. 125 recapitulate the recommendation of the three years system, but omit all reference to the detail of protection to existing interests which is given in par. 52 in the body of the report; now, on comparing clause 8 of the warrant with section 2 of par. 125 of the report, it is evident that the clause was copied from the summary and that protection was thus accidentally omitted. It is a matter of regret that this omission was not observed at the time, as the injustice to non-qualified lieutenant-colonels would probably have been prevented; this commenced with the promotion of 28 November 1854, under the 7th clause of the warrant, in which promotion 27 lieutenant-colonels, from Garvock to Wilbraham, were passed over, and the system was continued until November 1858, by which time 115 lieutenant-colonels had been passed over as non-qualified.

Memo of Mr. Croomes, page 54.

Warrant of 6 Oct. 1854.

Page 43 of Appendix to Report of 1858.

Had the proposed protection been given in the warrant, no revision of the list in 1858 would have been necessary; and, with reference to the case under discussion, it is evident that the 21 colonels specially promoted in 1855 and 1856 would have fallen into the very places now claimed for them. Colonel Wilbraham would have been included in the promotion of 28 November 1854, because although not then "qualified," he would have been *protected*, having completed three years' service as lieutenant-colonel on the 11th November 1854. Colonels Irwin and Flude having completed three years service in December would have been

next promoted; Colonels Tulloh and Teesdale would have been in like manner promoted in April, and when on the 18th of May 1855 it pleased Her Majesty to appoint Sir T. Troubridge her A.D.C., that officer would have taken his place as colonel at the bottom of the list next below Teesdale. The next promotions were those of five officers appointed aides-de-camp to the Queen on the 29th of June; then Colonel Adams having completed three years' service as lieutenant-colonel on the 16th July 1855 would have followed, and so on.

See extract from Army List in Appendix, p.52. See table, appendix 14, page 51 of report of 1858.

Having thus shown the real error of 1854, viz., the omission of protection in the warrant, the next step is to examine the report of the Royal Commissioners of 1858. We here find that they endeavoured, in accordance with the spirit of their instructions, "to report what measures are necessary "to neutralize the effect of any hardships" resulting from the changes of 1854. It would appear, however, that the Commissioners did not exactly apprehend the nature of the error of 1854; the subject is mentioned at par. 28 of their report, but from the latter part of the par. they seem to have been of opinion that some amount of passing over was contemplated, whereas, on the contrary, the recommendation of protection in the report of 1854 is most distinct and unqualified, and was not met by clause 8 of the warrant. The Commissioners of 1858 do not refer to the above recommendation, but appear to have conceived the idea that the whole of the lieutenant-colonels on the list prior to 20 June, 1854, ought to have been at once made full colonels; they "think it therefore a matter of regret" that this was not done, and in par. 48 recommend that this wholesale promotion should be given retrospectively by a brevet ante-dated to 28 November 1854, the date of the first promotions under the new rule.

Report of 1858, par. 3.

Warrant of 1854, clause 8.

Report of 1858, par. 34.

It is by this recommendation, which was carried out in the warrant of October 1858, that the 21 colonels specially promoted in 1855 and 1856 have been injured; of these officers ten were lieutenant-colonels prior to 20th June 1854, and have fallen back to the same places which they occupied before the war; the remaining 11 not having obtained their lieutenant-colonelcies until on or after the 20th June, 1854, (three of the number on that very day), have been turned down to the bottom of all those officers who were lieutenant-colonels prior to that date, because they have retained the dates of their special promotions as colonel in 1855 and 1856, while the lieutenant-colonels up to 20th June have all been by the antedated brevet made colonels of 28 November 1854. Of these officers thus antedated many had a fair claim to be restored to their former positions, viz., those who had been passed over up to the dates of the special promotions, but the antedated brevet has indiscriminately put up all who were passed over up to November 1858, and not them only, but many others, from Adams to White, who had not been passed over at all, and were not complainants in any way.

Printed extracts from Army List, in Appendix, page 52.

This antedated brevet having been proposed on the grounds that the Commissioners of 1854 ought to have then recommended the immediate promotion of all the lieutenant-colonels then on the list, it may fairly be considered whether it is probable that they would have proposed such a measure had the idea occurred to them, of which there is no trace in their report. They concluded their proceedings early in June 1854, and, had it been then proposed to promote all the lieutenant-colonels on the list down to Lieutenant-Colonel White, who only obtained his lieutenant-colonelcy on the 1st June, it would surely have been said, Why should this officer be promoted now? he cannot possibly be injured by the new three years' rule until after the 1st of June 1857, because no junior lieutenant-colonel can until then be qualified for promotion; it will, therefore, be time enough to promote him on that day, or as soon after as he may be in danger, in the event of any junior lieutenant-colonel becoming "qualified" before him; but this is provided for if the spirit of our recommendation is attended to, for we say in par. 52 that his "interests should be carefully protected." However that may be, the fact remains that no such recommendation was made or discussed, and it may fairly be questioned if the Commissioners in 1858 were justified in proposing a retrospective measure of so sweeping a nature, to the injury of interests such as those of the 21 colonels specially promoted in the interim under different regulations.

Par. 52 and 53 of Report of 1854.

This would appear the place to consider whether the effect of the antedated brevet on the 21 colonels was clearly foreseen.

In the 2d par. of the report (dated 10 July 1858) it is said "we thought it best to decline to receive oral evidence." It appears, however, that on the 28th April minutes were taken of the evidence of Major-General the Honourable Jas. Lindsay, and extracts of this evidence were recently read in the House of Commons by the Under-Secretary of State for War, with a view to show that the cases of the 21 colonels had been considered.

Report of 1858, par. 2.

Referring to these minutes of evidence it appears that two of the members were absent, viz., Lord Panmure and Sir Jas. Scarlett, and of those present, the chairman (the late Lord Herbert) and two military members, Sir F. Smith and Sir F. Williams, have stated that they did not understand that the interests of any officer specially promoted would be affected. The evidence bears out this view. In question 71 General Lindsay is asked by the chairman whether by his suggestion (67) he would get all the 115 officers passed over to stand in the same relation to one another just as if the warrant (6 Oct. 1854, clause 8) had never been in operation. His reply is "No doubt of it, but the officers promoted for distinguished service" (the 21 colonels now in question) "will occasionally intersect their dates." The chairman evidently not understanding General Lindsay's reply, says (73) "Take a higher case, Colonel Inglis was made a major-general, &c."

Appendix 1 page 45, of Report of 1858.

And again, in 76 and 77, it is clear that the point in question was not really understood.

In reply to question 78, it is unfortunate that it did not occur to General Lindsay to mention that 11 of the officers he alluded to were promoted to colonel on appointment as aides-de-camp to the Queen under a rule of long standing, and not under the 13th clause of the warrant of October 1854.

It will be observed that no mention whatever is made of Queen's aides-de-camp, either in this evidence or in the report.

It will be well in this place to point out the difference between the claims of the 11 Queen's aides-de camp and of the 10 colonels promoted under the 13th clause of the warrant of October 1854. As regards the first, the lieutenant-colonels of dates prior to 20 June 1854 could not claim protection against any such legitimate exercise of the Queen's prerogative, and consequently were not entitled to have such protection awarded them retrospectively as was given by the antedated brevet. Colonel White, a lieutenant-colonel of June 1854, might fairly have said, when the warrant of October was published, I claim protection against the new three years' clause, and I shall be fully protected if promoted on the 1st June 1857. I also claim not to have any junior lieutenant-colonel put over me under the 13th clause of the warrant, because that also is a new regulation; but he could not possibly have claimed protection up to June 1857 against the appointment of Queen's aides-de-camp, because he obtained his lieutenant-colonelcy with the knowledge that he was at any time liable to be passed over by them. Consequently, as regards the colonels, from Adams to White, they cannot complain of the promotion over their heads of 10 Queen's aides-de-camp, appointed before they had served three years as lieutenant-colonels.

With respect to the 10 colonels promoted under the warrant of 1854 the case would stand thus:—

In 1854 a new rule was introduced enabling promotion by selection to be given for distinguished service, both to colonels and to lieutenant-colonels. Under this rule several officers were promoted in 1855. Three years afterwards the rule was brought under the consideration of the Royal Commission of 1858, in which year seven officers, promoted by selection from colonel, were on the generals' list as supernumerary major-generals, and 10 promoted by selection from lieutenant-colonel were high up on the colonels' list. The Commissioners of 1858 recommended that the major-generals should retain the places to which they were promoted, and that the extra expense, above the fixed establishment, of their pay as major-generals, should fall on *the public* until they became absorbed. Had the case of the 10 colonels been considered, it is more than probable that a similar arrangement would have been proposed on their behalf. It would have been said these 10 officers were considered deserving of special promotion in the same way as the seven supernumerary major-generals. It was not foreseen at the time that their promotion under a rule introduced in 1856 would be an infringement of what may be considered the vested rights of the senior lieutenant-colonels then on the list; the cases are precisely analogous, and in justice to these 10 officers we must equally recommend that they should not be deprived of their special promotion, and, on the other hand, that the then existing interests of the lieutenant-colonels should not be allowed to suffer; they should consequently be promoted to the supernumerary list of major-generals, according to the dates of their special promotions. This, as above observed, does not apply to the aides-de-camp who were legitimately promoted under an old rule, and who may consequently be fairly promoted to major-general, according to the dates of their appointments as aides-de-camp, without entailing any expense on the public.

Appendix 1, page 25, of Report of 1858.

Par. 19.

If the fact that, 11 aides-de-camp to the Queen were ap-

pointed in the interim, had been clearly brought to the knowledge of the Commissioners, it is impossible to suppose that they would not have discussed the effect, on their interests, of the proposed changes. Throughout the report no allusion is made either to these 11 aides-de-camp, or to the 10 colonels promoted under the 13th clause of the warrant of 1854. No allusion is made to Gen. Lindsay's evidence, except at par. 29, in which his tables are adopted without any qualification, and these tables give to the 21 colonels the exact places now claimed, but which places the adoption of the peculiar mode of the "antedated brevet" as a remedy for the grievance then under consideration prevented these officers from holding. It may, therefore, fairly be assumed that the effect of the antedated brevet was not fully foreseen, and this is all the more probable, because it was contrary to the spirit of the report, and the manifest feeling of the Commissioners, to propose any change affecting the positions of any class of officers without the fullest explanation. Indeed, the greatest consideration is shown throughout to the feelings of every class affected, except to the 21 colonels specially promoted. At par. 37 the claims of 23 officers promoted for service in the field, and who were included in the 115 officers passed over, are fully discussed; some of these 23 were promoted on appointment as aides-de-camp to the Queen in 1855, some under the 13th clause of the warrant of 1854, and some were promoted to be lieutenant-colonels for service in former wars.

ppendix 10, age 45, of Report of 858.

The number of this class being nearly similar to that of the 21 colonels now under consideration, may have led some of the members of the Commission to suppose that the interests of the latter had been protected; but the cases are entirely different, and on reference to the list of the 23 it will be found that none of the 21 are there.

A still greater instance of the consideration shown for the feelings of officers affected by the proposed changes is, that the first and principal reason given for the selection of the *antedated brevet* as the most desirable mode of carrying into effect the principle of re-arranging the list, is, that it "will be less invidious to the promoted colonels, to whom "every consideration is due;" this means that instead of bringing down Col. Jones from the date of 28 Nov. 1854, to his proper place below Col. Garvock, and dating him 12 Dec. 1854 (the date of the latter officer's promotion), it would be "less invidious" to Col. Jones that he should retain his date of 28 Nov., and that Col. Garvock should be put above him with a similar date, which was done.

ee printed xtracts rom Army ists in ppendix, age 52.

Now what officers look to is their relative position to the top of the list, and the date is a matter of very secondary importance.

The only other reason given in par. 48 for the recommendation of the antedated brevet is that "it will mark "more clearly the object and intention of the proceeding." Had it not been for the special promotions in 1855 and 1856 the antedated brevet would have been as good a mode of re-arranging the list as any other; but had its effect on the colonels so promoted been foreseen, surely par. 48 would have contained some more cogent reasons for its adoption. It would have been stated (as appears to have been the impression of Sir C. Yorke's Committee) that by no other mode could the list of colonels be fairly re-arranged; and surely some expression of regret would have followed, that by this measure four-fifths of the colonels specially promoted for service in the Crimea would be unavoidably deprived of the whole or a great portion of their promotion, and that as regards the prerogative of the Queen in the appointment of aides-de-camps, it would so far necessarily be annulled. It may here be observed that, had the report of 1858 ended with par. 47, the principle of restoration of the 115 complainants would have been fully carried out, and the tables of Gen. Lindsay would have been adopted.

ppendix 10, ages 45 and 0, of Report f 1858.

Par. 48 appears to have been an afterthought, and to have been adopted because the Commissioners had hastily arrived at the conclusion that the error of 1854 consisted in not having at once promoted all lieutenant-colonels (although none of them were in danger till the expiration of three years' service), and because it appeared on the whole the most convenient mode of carrying out the principle of restoration, the special promotions being overlooked.

It may here be observed that there were three simple ways of re-arranging the list, open to the Commissioners, and that their object was simply to "neutralize" the effects of the three years' clause, and "to consider what relief it is "still possible to afford." The complainants were 115 officers passed over; if each officer had been put up into the relative place which he occupied in May 1854, with a suitable date, the grievance would have been redressed. If each of the 206 colonels, promoted under the three years' clause, had been brought down to his former relative place the same result would have been attained. If, as proposed by Maj.-Gen. Lindsay, the Army List of June 1854 had been taken as a guide for the relative places originally held by the lieutenant-colonels, and each had been dated as colonel at the expiration of three years' service as lieutenant-colonel, no officer could have complained; now by each of these modes the 21 colonels specially promoted would have retained the places they now claim. It is evident, therefore, that the only difference in the result of the adoption of either of the above modes, or of the antedated brevet, is, that by the latter the 21 colonels are turned down, all the other officers holding exactly the same relative places by each mode.

Appendix 14, page 50, of Report of 1858.

On reference to the return printed by order of the House of Commons (27th Feb. 1863, Parliamentary Papers, pages 15 and 17) it will be seen that in August 1856, and again in July 1860, the late Lord Herbert recommended the restoration of the 21 colonels to the places now claimed.

In May 1862 (page 34) the late Sir G. Lewis wrote to the Treasury recommending that they should be promoted as if they held the places claimed.

Mr. Peel, in reply (page 40), clearly points out the justice of their claims, which the Lords of the Treasury consider to be such as not to warrant any charge to the public. This opinion being made known to His Royal Highness the Commander-in-Chief in August 1862, the Military Secretary replies, Sept. 1862 (page 56), that although adhering to his former opinion, &c., "His Royal Highness will not object "to the proposal being carried into effect."

This last letter was, however, cancelled by a letter of the Military Secretary of Feb. 1863 (page 40), stating that His Royal Highness, "having further reconsidered the question, is of "opinion that the objections to the proposal are so great that "His Royal Highness does not feel justified in agreeing to "it." It may be observed that the report of Sir C. Yorke's Committee has never been confirmed; on the contrary, the report is dated July 1861, and in May 1862, Sir G. Lewis wrote to the Treasury recommending the appropriation of a sum of 11,000*l.* to enable the colonels in question to be promoted in their proper turns as supernumerary major-generals. It is therefore incorrect to suppose that the case has been fully investigated and finally settled.

The arguments advanced against the restoration of the colonels in question are as follows:—

In the letter of the Military Secretary of Sept. 1859 (Parliamentary Papers, page 16) it is stated that the Commissioners of 1858 assumed that all lieutenant-colonels of date prior to June 1854 had a claim not to be passed over by any promotions made under a regulation which did not then exist, and recommended the antedated brevet in consequence. This is so, but the Commissioners forgot that the promotion of Queen's aides-de-camp, on appointment, was not a new regulation, but dates from the reign of George I.

Again, at paragraph 6, it is said, "it is of course to be "assumed that what was then done (in 1858) should have "been done in 1854;" but, on looking back to the report of 1854, this assumption falls to the ground. The technical difficulty as regards the antedating of some of these officers is next stated as an objection; this, however, had been foreseen and met in the War-Office letter of Aug. 1859 (page 15).

It will be observed that in this letter the injurious effect of the warrant of 1858 is fully recognized; it follows, then, that the objections to the redress claimed arise from the nature of the injury inflicted; this is like saying to a transported convict, whose innocence has subsequently been proved, we regret your unfortunate position, but there is no precedent for sending you home, consequently you must remain where you are.

The arguments in the report of Sir C. Yorke's Committee (Parliamentary Papers, page 4) are as follows:—

We cannot recommend "any change in the arrangements "made by the Royal warrant of 14th Oct. 1858, a warrant "founded on the report of a Royal Commission, consisting "of His Royal Highness the General Commanding-in-Chief, "five former Secretaries of War, &c." And again, "the "more we investigate the subject the more we feel convinced "that to disturb the present order of the colonels' list, &c." But the appeal to the Committee was against one of the recommendations of the Commission of 1858, and was made at the instance of the president himself, and with the concurrence of three of the members; therefore it was no argument to say that the arrangements made by a Royal warrant should not be disturbed, nor are any reasons given for arriving at that conclusion. It is as though the Lord Chancellor, in an appeal case, were to say, the Vice-Chancellor is a very competent authority, and it is undesirable to disturb his judgment, although, as in the case in point, the Vice-Chancellor himself may have seen reason to alter his opinion.

In paragraph 3, it is stated that Sir C. Yorke's Committee entirely concur in the view of the question expressed in

Sir C. Yorke's letter (as Military Secretary) of the 26th Sept. 1859. This letter has already been alluded to.

The arguments of officers who object to the proposed changes may be classed as follows:—

1st. Letters from Lord West and Colonel Percy written under the impression that they would be affected by the change, which is not the case, although it has been repeatedly stated in military and other newspapers; these officers claim a higher position than any of the 21 colonels, in virtue of the dates of their lieutenant-colonelcies, and although they were for upwards of three years below these colonels, their claims and those of many others to stand above them is not disputed.

2d. Colonel D. George, Colonel O'Halloran, Colonel Yorke, and Colonel Nedham have written to the effect that they are in some instances older officers than the 21 colonels, that they were senior as lieutenant-colonels, and that having by the antedated brevet regained the position above these officers which they held before the Crimean war, they hope not to be again superseded by them. The date of entering the service is manifestly irrelevant, as the Army List is not arranged with reference to seniority. The fact of these officers having been senior as lieutenant-colonels is in the nature of the case the special reward given to the 21 colonels in question was their promotion over all the lieutenant-colonels then above them on the list among whom were Colonels O'Halloran, &c. All promotion is given at the expense of some one or more officers. What these officers should endeavour to prove is that they had claims to be colonels before May 1855, in which case they would, like the colonels in italics in the extracts from the Army List of April 1863, have been entitled to resume their former relative places above the 21 colonels; for instance, if Colonel Nedham, R.A., being a lieutenant-colonel of Feb. 1854, could prove that he had any real right to be a full colonel of 28 Nov. 1854 (which he became by the *antedated brevet*), then he would establish a claim to stand before Colonel Warde, who being a lieutenant-colonel equally of Feb. 1854, was specially promoted in Nov. 1855; but Colonel Nedham can prove no claim to be a colonel until Feb. 1857, when having completed three years' service as lieutenant-colonel, he might fairly have claimed promotion whether qualified or not (he was not qualified or promoted until 22 Dec. 1857). By the antedated brevet Colonel Warde's special promotion has been cancelled, and he might as well have been at home as in the field.

Appendix, page 52.

3d. Col. Brownrigg has written to object to any disturbance of the list of colonels on different grounds from the above officers. It would appear that he objects to the principle of special promotion by selection, having undergone "the bitter mortification of being passed over by eight "officers junior to myself." Col. Brownrigg having by the accident of the antedated brevet resumed his original place above those eight officers, objects to their being replaced above him, on the grounds, not that he has any claim to be a colonel of Nov. 1854, but because "it is not altogether "unreasonable to expect that, should the army again have "to take the field, those officers who are considered to have "distinguished themselves would be likely to gain employ-"ment, and I should thus find eight additional obstacles "between myself and perhaps the chance of distinction." This may be considered as a personal argument, for Col. Brownrigg could claim, in virtue of his own special promotion, to be next to Col. Brunker, 18 places higher than he now stands; but then the eight officers above alluded to would be above him.

Appendix C, page 19, of Parliamentary Papers.

In conclusion, the claims of the 11 Queen's aides-de-camp and 10 colonels promoted under the warrant of 1854 may be thus briefly summed up:—The former class complain, that having been specially promoted under a regulation of long standing, they have been turned down, without a single allusion being made to them in the report, to positions considerably lower than those they might occupy with the fullest justice to the officers passed over under the three years' clause. The latter class complain, that having been specially promoted under the same warrant as the majors-generals selected for promotion in the Crimea, they have been deprived of the whole or the greater portion of their promotion, whereas the major-generals have been permitted to retain the whole of theirs as supernumerary major-generals. Both classes consider the antedated brevet to have been unnecessary, because full justice could have been done to the 115 officers passed over by other modes of re-arrangement, and to have been adopted by an oversight, because its operation on them is not mentioned in the report, and because the president and three of the military members of the Commission of 1858 have *so stated; vide* General Lindsay's and Sir James Scarlett's evidence, Sir F. Smith's statement in the House of Commons, April 28, 1863, and Sir F. Williams' note in possession of General Peel.

---

## Copy of a Letter forwarded by Colonel Sir D. E. Wood, K.C.B., R. Art. (Received 14th May 1863.)

Sir, Littleton, April 9, 1859.

I trust you will excuse my troubling you, but as chairman of the Commission that altered the warrant of 1854 regulating the promotion of the army, on the amalgamation of Horse Guards and Ordnance, considering as I do that that through an inadvertency of that Commission an injustice has been done me, and having just returned from India, I could not before bring my claims under your notice; and I know of no one so proper as yourself to ask to take my case under your consideration.

I am a lieutenant-colonel of artillery, and as such served from the commencement to the end of the siege of Sebastopol, in command of the artillery of the 4th division, and I am the only one of my rank that never left the army, or was absent from my duty from any cause, from the commencement to the end of the siege of Sebastopol, and until the army quitted the Crimea. I was promoted for distinguished service in the field in November 1855, and the late Commander-in-Chief, on my return to England, complimented me on my service, and assured me no one would gainsay my promotion. My answer to him was, that if I had served in the French army I should have been made a general in April 1855, all officers in the French army, holding similar commands as myself, having been promoted.

Now I have just returned from India, having commanded the brigade of field artillery in the operations before Lucknow, and in the assault and capture of the place; afterwards the Right Honorable the Governor-General and his Excellency the Commander-in-Chief appointed me to command the fort at Allahabad and the brigade there, the most important station in India, with the rank of brigadier on the permanent staff of the Indian army, with a garrison varying from 3,000 to 10,000 men of all arms, with a depôt of sick and wounded soldiers from all parts of the north-western provinces, and at a time of the greatest anxiety, when Allahabad was surrounded by rebels. I successfully commanded there, and gained the approbation of my superiors. The conclusion of the rebellion induced the Indian Government to curtail their forces, and I was ordered home; and now find myself, by the alterations made by the Commission over which you presided, in the warrant of November 1854, placed back in my original, or nearly so, place in the army; and the only reward I have to acknowledge for my military life is a companionship of the Bath; whereas officers under my command have received one or two steps of promotion, and the companionship of the Order of the Bath. Belonging to a corps where promotion by purchase is not permitted, I did not feel aggrieved by officers in the army passing over my head by purchase, as I hoped for an opportunity, which did occur, of risking my life and health in the service of my country, to regain my place in the army that I had lost by those officers who had been promoted by purchase passing over my head, whilst serving at home and abroad in the subaltern ranks of the Royal artillery. Under the operations of the existing warrant, with a limited number of general officers for the Royal artillery, I see no prospect of regaining my place in the army.

The lieutenant-colonels previous to 1854, who were promoted by the new warrant and antedated brevet, gained their promotion over my head chiefly by purchase; and to this advantage has been added, by this brevet, a longer service as lieutenant-colonel, and their vested right to promotion by purchase secured to them against mine, who can only earn it by service in the field before the enemy; and when made a major-general every one of these officers who has purchased his commissions over my head is again to pass over me, who have earned my promotion only by distinguished service in the field. All I can add to this statement is, that it is the hardest trial of many that in 30 years' service I have had to endure, and it at this moment places me under the command of those who I have successfully commanded in the field before the enemy.

May I beg your powerful interest to obtain for me the rank of major-general, and release me from the position I am now placed in, hoping that when in that rank my turn comes to be again passed over by officers who have gained their promotion by purchase over my head, I may be serving in a rank which will prevent my being passed over by any but those who have distinguished themselves in the service of their country, and enable me to have an honourable ending to my military career.

I have, &c.

(Signed) D. E. Wood, Colonel,
Commanding 1st R.H.B. R.H.A.

Right Hon. Sidney Herbert, M.P.

## Statement of Major-General Stehelin, Royal Engineers.

Mr. President and Gentlemen,

Although my interests were so intimately connected with the subject, it is strange that until within the last three days, I was not aware that Colonel J. Gordon had last year made an endeavour to be promoted to the vacancy to which I succeeded as major-general.

The authorities having already done me justice in this matter, I should not have troubled the Commission with my present statement, but from the almost certainty that Colonels Gordon and Chapman have, or will make an endeavour to obtain the rank of major-general, with commissions antedated to mine, viz., 3d April 1862.

A certain military position was secured to me by Her Majesty's warrant, dated 14th October 1858, further confirmed by the warrant of 1861, and the report of a military commission. I have every reason therefore to expect and to hope that, unless forfeited by misconduct, that position will not be disturbed by any officer being placed over my head, the effect of which will be to deprive me for ever of obtaining the rank of colonel commandant of the Royal engineers—a step to which every ordnance officer on his appointment, and during the necessarily very long course of his service, was encouraged to look up to, as a reward in the latter years of his life for many years of toilsome and faithful service.

I entered the Royal Military Academy in 1813, and obtained my commission in 1816, under the expectation that this reward was secured to me by the principle of regimental succession to vacancies, throughout all the ranks of the corps; such principle having been established at the formation of the ordnance corps, and continued uninterrupted until lately, except in the instance of the late Lord Bloomfield, whose promotion to a battalion out of his regular turn in the Royal artillery was understood at the time to have been strongly opposed by his Grace the Duke of Wellington, master-general of the ordnance.

My grandfather entered the artillery under this regulation nearly 120 years ago (1746), and my father 87 years ago (1776), and both obtained battalions by regimental succession. I have been nearly 47 years in the Royal engineers, in like manner toiling through the several ranks, but whether I shall ever attain to the highest rank in the corps will depend upon the opinion which is given by the present Commission, on the endeavours that are making to place two officers, respectively 17 and 19 years my juniors, over my head, virtually placing me two steps down in the corps.

There must be seven vacancies before I can obtain the rank of colonel-commandant, and, according to the ordinary promotion, seven years must elapse before these vacancies take place. I am 65 years of age, and under present circumstances I must be 72 years of age before I can get my battalion; but, supposing two officers, about 18 years junior to me, are put over me, I may consider my chance of promotion to this step as for ever shut out, and remain the rest of my life as an unattached major-general, Royal engineers, with an inadequate income.

Out of 47 years' service on full pay I have been nearly 30 years abroad. I have served in the hottest and coldest of climates, Mauritius and Canada, and was at Bermuda during the great sickness of 1819, when one half, officers (Captain Mercer) and men of the 6th company, Royal sappers and miners, died of the yellow fever, and out of a detachment of one serjeant and his wife, one bugler, and 12 sappers, which went out with me, we lost the whole party, except one sapper and a young bugler. During the time I was battling with this malignant disease, Colonels Gordon and Chapman were still in their infancy, and before either of them had obtained his commission I had served 11 years abroad at two different stations, west and east of the Cape of Good Hope.

I have had staff employments in Ireland and Canada for 13 years, and a colonial one for three years, and I trust I need not say I have always done my duty faithfully and zealously, and to the satisfaction of the officers of the corps under whom I have served, and it would be an unmerited reflection on myself, and the other officers of my standing, to suppose we should not have done our duty in the Crimea, if we had been called upon to serve there.

The rank of colonel is a permanent one in the ordnance corps, and the brevet rank of major, lieutenant-colonel, and colonel does not exonerate, nor has not exonerated Colonels Gordon and Chapman, and other officers, while captains, from rising to lieutenant-colonel by regimental succession; and I submit to the Commission that it appears an injustice, therefore, to the elder officers, that officers holding brevet rank should be able to dispense altogether with the rank of regimental colonel, by becoming colonels, commandant over the heads of 20 or 30 senior officers of the corps.

I annex a comparative statement of the dates of my several commissions, and those of Colonels Gordon and Chapman.

I have the honour to be,
Mr. President and Gentlemen,
Your most obedient servant,
Ben. T. Stehelin,
Maj.-Gen. R. Engineers.

## Letter from Colonel Ormsby, Roy. Art.

Shorncliffe, May 14, 1863.

My dear Sir George Brown,

Seeing you are appointed one of the Royal Commissioners to investigate the claims of the "distinguished Colonels," I take the liberty of bringing to your notice how seriously my prospects would be affected by any alteration in the warrant of 1858.

Having been a lieutenant-colonel of 1854, I, together with more than 100 other lieutenant colonels, were either promoted to the rank of colonel, bearing date the 28th Nov. 1854, or antedated to that day, by the effect of the royal warrant of 1858. The colonels of 1855, whose case General Lindsay advocates, I presume, wish to be placed in the list of 1854, and evidently they do not claim the being placed at the bottom of that list, as in that case they would gain nothing by it; I can, therefore, only suppose that they desire to be placed before those who were promoted on the 28th Nov. 1854.

I beg, therefore, to submit, that if such an event took place I should consider it an injustice to myself, for instance, in the month of May 1854, just previous to the brevet of June 1854, Sir T. Troubridge, Colonel Dickson, Colonel Norcott, Colonel Lysons, and Lord Longford were majors; and Colonel Gordon, H.S.H. Prince Saxe Weimar, Sir D. Wood, Colonels Fitzmayer, Chapman, and Wetherall were all captains. If, therefore, the above-mentioned officers were antedated as colonels to Nov. 1854, they would become colonels when they were not even majors. Some did not become even brevet-majors until 12th Dec. 1854; so that if they were antedated as colonels to Nov. 1854, they would be holding commissions as colonels when actually they were only captains in the army.

Now, as all of these "distinguished colonels" had two steps of brevet-rank, and several of them three, in a little more than a year, I conceive that they have no claim to be placed over me. I having been a lieutenant-colonel in the early part of 1854 (March).

In conclusion, I beg most respectfully to state that I shall consider it a great grievance should these colonels be placed before me; none of them became lieutenant-colonels before the 20th June 1854, and I became a lieutenant-colonel before the operation of the warrant of 1854, and at that time these colonels of 1855 were not only not lieutenant-colonels, but the greater portion of them were simply captains in the army, and holding no brevet rank whatever.

I trust you will excuse the great length of these remarks, and accept my apologies for trespassing on your time.

I have the honour to be, &c.
J. W. Ormsby,
Col. Com. 9th Brigade Royal Artillery.

General Sir G. Brown, G.C.B.,
&c. &c.

## Colonel O'Halloran's Statement.

In making the following statement, I cannot hope to throw much light upon the question which is now undergoing consideration, and which, in the reports that have been so carefully, lucidly, and comprehensively prepared, and in the

recent debate which took place in Parliament, appears to me to have left little more to be said on either side; and therefore it is with great unwillingness that I intrude myself upon the attention of the Royal Commissioners; but my name having been prominently mentioned by Major-General the Honourable James Lindsay, M.P., in his speech before the House, (in connexion with Colonel George,) as protesting against the exercise of the royal prerogative, in the case of certain officers promoted to be Queen's aides-de-camp in 1855–56, I beg to say, that, so far from disputing that prerogative, I take my own stand upon it, and point to its attempted violation as regards my own rights, and those of others similarly circumstanced.

I was lieutenant-colonel some 16 or 17 months before the warrant containing the three years' qualifying rule came into existence. It ought, therefore, to have been inoperative in my case, and in that of every officer who became lieutenant colonel prior to its publication, in any way to cause us disadvantage. We were not fairly subject to its retrospective action; and in order to remedy the great wrong which we suffered thereby (a wrong which no one attempted to dispute) a Royal Commission was convened to consider the question in all its bearings; that Commission, which included General Lindsay as one of its members, submitted to Her Majesty (General Lindsay being dissentient from the course recommended) that all those lieutenant-colonels who had been superseded, in violation of regulations as they existed when they respectively attained that rank, should one and all have their commissions as colonels antedated to 28th November, 1854; and Her Majesty, on the recommendation of His Royal Highness the General Commanding-in-Chief, having graciously approved the suggestion, I conceive the royal prerogative in our case to be just as binding, and just as forcible, as the prerogative quoted in the case of the colonels who were created such for distinguished service. I cannot, therefore, accept General Lindsay's argument as affecting in the slightest degree the stability of the position which I occupy under the Queen's warrant. I have nothing whatever to do with things as they *might have been* under the operation of a different view of the claims of the distinguished service colonels, than that which was actually taken by the Royal Commission of 1858, and which has been so clearly set forth in the published report. I have nothing to do with deductions drawn from any hypothetical bases. My arguments apply to facts as they stand, and those facts are that Her Majesty having, by Her gracious will and pleasure, created me a full colonel on the 28th November 1854, no officer promoted for distinguished service at a *subsequent date* can lay claim to supersede me in that rank, or to apply with that view for a recognition of services before those services were actually performed.

Up to the year 1854, when the Russian war broke out, no officer who had attained the rank of lieutenant-colonel could possibly, under any circumstances of service, be superseded by his junior, unless through the operation of the Royal prerogative in creating that junior aide-de-camp to the Sovereign; and even that did not necessarily involve the rank of full colonel, of which fact I believe there are two instances on record, during the reign of William the 4th. Now, only nine out of the 22 officers, whose distinguished services it is proposed to antedate to a period when the very occasion for those services had not arisen—which I need not observe is a violation alike of military fact and of military usage—were created full colonel in the manner referred to; and four of them being only captains on the 28th November 1854, it was impossible for them, whether by creation as Queen's aide-de-camp, or otherwise, legitimately to become colonels on that date, inasmuch as they were two steps of rank short of the required qualification. The same remarks apply in degree to five others, who were majors at the date referred to; and in the proposed way of overcoming this difficulty, namely, by antedating the commissions of these officers, both as lieutenant-colonels and majors, I only see the awkward precedent established, that degrees of rank, which cost some men the labour of a life to attain, may be jumped over by others without the inconvenience or the drudgery of serving a day or an hour in either.

The oldest officer on the list of those who seek to supersede me is three and a-half years my junior in point of first commissions, and others were not even *born*, when I was serving Her Majesty's predecessors (William IV., George IV., and George III.,) in her distant colonies.

As regards comparative quality of services, upon which, in the recent debate, as well as in clause 33 of his counter-report dated 25th July 1861, General Lindsay has laid so much stress, *that*, I beg to observe, in my own particular case at least, has not been of my own choosing; and few, I think, would like to tread the same slow, and discouraging, and hazardous path, that I have done; slow, without escaping the necessity thereby, for purchase; discouraging, from first to last, except in the solitary instance which it is sought now to disturb; and perpetually hazardous, without hope or chance of distinction. I know that the circumstance of an officer being "unmedalled," constituting as it does the absence of a feature of service which very properly ranks as the highest in the order of consideration, places that officer at a disadvantage as compared with those who have won decorations, but who, it should be remembered, in those very decorations, have much to cheer them in the onward path of duty, and to increase alike their military contentment and their zeal.

Conceding to these gallant men their well-earned title to their country's favour, I would yet respectfully submit, on behalf of the class which I myself represent—the officer of long and hard colonial service—that no man can do more than fulfil the requirements of his Queen and country, *in the form in which they are presented to him;* cheerfully accepting the rough as well as the smooth; cheerfully encountering those risks of climate which carry with them neither distinction nor reward, and from which, therefore, most men are disposed to shrink; risks which, if my own experience, or the published statistics on the subject, be of any value, may, in their mortality, compare with any battle fields.

I served in one regiment, the 69th, for 34 years and 5 months, being present with it wherever its colours were unfurled during the above long period; and, though undecorated, I have documents to show that *that* was my misfortune, not my fault; having asked for war employment whenever a chance presented itself, namely, after the battle of Chillianwallah, during the Crimean campaign, during the Indian mutiny, and when the Trent affair broke out; offering, on the last-named occasion, to give up my retired full-pay of 20*s.* per diem for service in "any form" in the field.

It is well known that, in the Duke of Wellington's opinion, it was of small moment whether, in following the fortunes of his corps, an officer had been in action or not. His great principle was the faithful performance of *duty* in whatever form it came; and he cared not whether that duty was at home, abroad, in good or in bad climates, or before the enemy. The point to which his inquiries invariably tended was: Has the officer well done his duty? Has he gone with his regiment wherever it was ordered? Has he shared its services without evasion, at all times, and under all circumstances? He knew and felt the justice of this principle. He knew it was not in an officer's power to *select* service, except by "exchange;" and this, as leading to frequent shirking of duty, he was sternly and unbendingly opposed to. I contend, therefore, that the performance of duty, in the view taken of it by England's greatest general, ought to weigh in the balance against all adventitious influences, whether of birth, or interest, or wealth, or even the luck of being present where troops are successfully employed, a luck which seldom fails to carry with it the additional luck of rapid promotion, and decorations, and honours, and pension, and well-paid staff employment.

Finally, I would observe, that to alter our position now, after a five years' tenure of that position, would necessarily destroy, in the minds of military men, all confidence as to the present and the future of their professioal career.

H. D. O'Halloran, Col.

50, Elgin Crescent, Kensington Park, W.,
23 May 1862.

## Lieut.-Colonel Haygarth's Statement

49, Chester Square, May 14, 1863.

Lieutenant-Colonel Haygarth (late Scots Fusilier Guards), has the honor to submit to General Peel, and the members of the Commission appointed by Her Majesty to inquire into the working of the warrant of 1854, his claim to be promoted to the rank of colonel, which would now be purely honorary, but which he humbly submits he ought to have received previous to his retirement from the service in 1860, he having attained the rank of lieutenant-colonel and captain in the guards on the 14th July 1854, previous to the issuing of the warrant of October of that year, which altered all the rules of promotion. Lieut-Col. Haygarth believes that nearly 300 Lieutenant-colonels were promoted over his head previous to his retirement from the service. This he always considered a great hardship, after having served 20 years in the guards (six of which as adjutant), and having been so severely wounded at the battle of the Alma as to unfit him for active servive. He ventures therefore to submit this statement to the favorable consideration of the Board, hoping, that should the petition of Colonel Carleton be granted, the claims of those promoted to be lieutenant-colonels at the same time as him, but who have since left the service, may not be over-looked.

To Lieut-Gen. Right Hon. J. Peel,
&c. &c. &c.

# The 1858 Evidence.

Copy of Evidence taken before the Royal Commission of 12 April 1858.
(Not published with their Report.)

## Wednesday, 28th April 1858.

PRESENT:

H.R.H. The Duke of Cambridge, K.G.
His Grace The Duke of Newcastle.
The Right Hon. Earl Grey.
Major-General Lord Rokeby, K.C.B.
The Right Hon. Sidney Herbert.
The Right Hon. Edward Ellice.
Major-Gen. Sir J. M. F. Smith, K.H.
Major-Gen. Sir W. Fenwick Williams, Bart., K.C.B.
Colonel Sir H. K. Storks, K.C.B.
Colonel Henry Eyre.

The Right Hon. SIDNEY HERBERT in the Chair.

Colonel The Hon. James Lindsay, examined.

1. (*Chairman.*) What rank do you hold in the army?—Colonel and captain and lieutenant-colonel in the grenadier guards.

2. You have given, I believe, a good deal of attention to the operation of the warrant of 1854?—Yes, I have.

3. Will you state the substance of the grievance which you consider has been undergone by lieutenant-colonels since the warrant was passed, by being passed over by other lieutenant-colonels who had the command of regiments?—The grievance with regard to these particular officers is this, that officers who had risen to the rank of lieutenant-colonel before the 20th June 1854 under the then established rules of the service, have, by a sudden alteration of system, and by a new rule made to apply to that rank after they had obtained it, been passed over and superseded by lieutenant-colonels junior to them, who had the good fortune to come within the provisions of the new rule, and which is therefore retrospective in its action upon them.

4. You mean that portion of the warrant which gives the rank of colonel to a lieutenant-colonel after being three years in command of a regiment?—Yes; I had better state what the rule and practice had been beforehand. The rule and practice of the service had been, for a century and more, that when an officer had once obtained the rank of lieutenant-colonel, he rose in succession in the place which the date of his commission as lieutenant-colonel gave him, by periodical brevets, to the higher ranks of colonel and general, and no one could pass over him except in a case marked out for the special approbation of the Crown. By the new rule lieutenant-colonels in command of regiments, or brevet lieutenant-colonels on the staff, are, after having served three years in those capacities, to receive the rank of colonel.

5. In what manner have the lieutenant-colonels been affected by that rule?—In this way; on the 28th of November 1854, all substantive lieutenant-colonels who had then completed their three years in command were promoted to the rank of colonel, by which they at once went over the heads of all those who had not complied with the terms of the new rule; on that day 108 officers were so passed over, some of them lieutenant-colonels who had not served three years as such, others, regimental majors, and brevet lieutenant-colonels. Since the above date, as each regimental lieutenant-colonel completes his three years' service, he goes over those senior to him on the list who have not done so.

6. Do you hold that it is impossible to make any new regulation for the efficiency of the service, if it tends to operate injuriously upon the private interests of individual officers?—I hold this, that existing interests ought to be secured, and that the new rule which was then made could have been carried out with full security to those existing interests.

7. As I understand you, you do not object to the rule by which officers who are serving pass over the heads of those who are not serving, but you object to that rule being applied to persons already in the rank?—Yes, that is the first objection, but the objection would naturally go a little further, and which will probably be mentioned hereafter, that there are certain officers who had not then existing interests as lieutenant-colonels, but whom it might be the natural duty of the military authorities to protect, they having served a sufficient length of time under the old regulations to secure to them the full value of their general's rank and pay when they attain that rank.

8. But the lieutenant-colonels who are passed over, not being in command of regiments, will ultimately rise by seniority to be major-generals, will they not?—They will do so, but in the meantime they are passed over, and they are existing interests. When periodical brevets were abolished by the warrant of October 1854, a rule was made which limited the number of generals to 234, and enacting that until the list was reduced to that number, one colonel, one lieutenant-colonel, and one major were to be promoted for every three deaths among the generals. After the list was reduced, one was to be promoted for every death, but in the meantime, although promotion may be going on, yet those officers are undergoing continually supercession, by which that promotion is rendered more remote.

9. But the change from periodical brevets to the regular annual promotions upon every death vacancy does not affect the question one way or the other, for whether 100 men are promoted once in five years to be major-generals, or 20 are promoted every year to be generals, it comes to the same thing?—Yes, that applies to the rank of general, but the periodical brevet system could not have been conducted with this new system; under the old system the supercession would not have gone on.

10. When a general officer dies there is a brevet limited to one person, is there not?—Yes.

11. Therefore the warrant does not affect injuriously the interests of those particular officers?—It does so, because under the old system they would have been promoted without being superseded.

12. The doing away with the periodical brevet, and substituting the present system, does not affect their interests injuriously or otherwise?—No; as far as those officers are concerned they have not yet arrived at that position, and no doubt the brevet which goes on on every death vacancy is a better system than the periodical brevet; it is more just to those who are at the top of the list.

13. Does it affect the question of purchase in any way? Is it more advantageous to officers who then knew when their turn would come, and made their arrangements accordingly?—Yes, I think it gives them a better opportunity, as they are not taken so suddenly.

14. It prevents, does it not, to a certain extent, the gambling of the officers, running themselves against the probability of a brevet?—I do not see that?—

15. I mean that an officer is not caught by an unexpected brevet, and so loses the value of his commission?—Certainly he is not.

16. Will you state to the Commission the number of the officers who had obtained the rank of lieutenant-colonel before the 20th of June 1854, have been superseded under this rule, and are now serving?—The total number at present serving on full and half-pay, who became lieutenant-colonels before the 20th of June 1854, is 115. Of course, I have no official knowledge about all these transactions; I merely give an approximation. I have taken it from the Army list and from what is in the Gazettes; it is therefore subject to correction, but I believe the total number at present serving on full and half-pay is 115, 34 of whom may be excluded from calculation at present, as having been many years on half-pay, and not having served six years as field officers on regimental full-pay, they will not affect the ulterior rise of others to the rank of major-general.

17. They will not affect the case, nor occupy any of the places of the 234?—Just so; they will have an asterisk attached to their names.

18. They will not obtain that nominal rank of general so soon as they otherwise would?—Certainly not, for they have been passed over.

19. Is there any classification into which you can divide those 115 lieutenant-colonels?—Yes; there are peculiar circumstances affecting some, but I hope I may say, as I am here to express an opinion which I do, under correction, that I hold, that under no circumstances, unless a strong case of public good can be made out, could the authorities be justified in applying this new rule to officers who are in the enjoyment of the particular rank affected by the rule.

20. Under those circumstances, you would debar the Crown from ever making a change affecting any officer in the rank to which that change was to apply?—I would judge of that change when I saw it before me, but here is an instance in which neither the late Commission, nor any body that I ever heard, has attempted to make out a case in favour of the public good.

# The 1858 Evidence.

21. The late Commission made out this case for the public good:—That whereas the major-generals were very old, and as the succession to their rank was by seniority, and they were not likely to get younger, it was important to select officers from the rank of colonels, and to employ them in command as brigadiers, with a view to give them experience, which would not be lost by their becoming too old to serve again; was not that an important consideration?—Certainly; but with regard to those officers whose position is the present subject of inquiry, the Crown is fully competent to do all that is requisite, without injuring those interests.

22. By passing men who are in the command of regiments, and who are therefore still with their corps, and fresh from military experience over the heads of those who are not serving and on half-pay, do you not get younger men, and in all probability more efficient men as colonels, than you would if you left them all to become colonels by seniority, including those who were not serving and on half-pay?—It is impossible to say that you would not do so, but the practical effect as far as those particular officers are concerned has not been so. There are a great number of officers very young in the service who have been excluded from the rank of colonel under the operation of this warrant.

23. Not substantive colonels?—Not generally, but some have been passed over because they had not served three years.

24. Those are officers who have never been in the command of a battalion?—Yes, but still they were in the enjoyment of that rank before this new rule was thought of, and I think that they come under the head of existing interests, which should have been secured.

25. Do you consider that the fact of an officer having purchased that step, subject to certain conditions which have been subsequently changed, is an additional reason why no such change should have been made?—With regard to this particular body of officers only in one class of instances; I have excluded wholly the idea of purchase throughout, but still in these existing interests the question of purchase does come in in a manner which I will mention to the Commission. There are officers being regimental majors, and having the rank of brevet lieutenant-colonels, who made arrangements relying upon the faith of the existing regulations, and allowed a junior major to obtain the command of a regiment over them; that is the only instance in which I have considered the question of purchase.

26. What was their object in making that arrangement?—This was their object; they were already majors, and they became in course of time by the number of years they had served as majors brevet lieutenant-colonels, but having attained the rank of brevet lieutenant-colonel, the major says to himself, "I am now in full swing for further promotion to the rank of colonel and general; no one can go over my head; in garrison, in camp, with the army in the field, my brevet rank is good for all purposes of command. I do not care about purchasing the command of my regiment, and I will let a junior major go over my head." He does so, and the junior major becomes lieutenant-colonel commanding a regiment, and in three years time he gets the rank of colonel, while the officer who had been major and brevet lieutenant-colonel, and who had been purchased over, remains still the senior major, and does not get the rank of colonel. That is the way in which it works.

27. The case you put is that of an officer who, upon a speculation of his own, thought it advantageous not to take the command of a regiment, but to wait his turn to become, by brevet, major-general, which he might have become without having the command of a regiment?—That is so; but this officer is included in that particular body, and as the Commission of 1854 expressed itself, those officers who had relied upon the faith of the existing regulations should have their interests secured.

28. With a view to securing those interests as far as could be done, was there not an increase of retirement from the rank of lieutenant-colonel given?—Yes, but of course it is optional with the officer whether he chooses to take it. Any one wishing to serve naturally will not accept it.

29. Suppose this case, that a man may be passed over by six officers, but on the other hand six of his seniors accept the new boon in the shape of additional retired pay, he is, relatively to his rank of major-general, exactly where he was?—He is pushed on by the six who are gone away.

30. As much as he is pushed back by the six who have passed over him?—Yes, it is the same in that way so far.

31. *Pro tanto* that increase of the full pay retirement was an advantage, not only to the men who took it but to those below them who did not take it?—No doubt, the more that go above your head the better. There is another class of officers, of whom there are 21, who have been so passed over, and who have obtained the rank of brevet lieutenant-colonel for distinguished services in the field; and the question arises—what was Her Majesty's intention in conferring that rank upon those officers, and whether it was not her intention to give them the full advantage of the rank which she had conferred upon them? I think perhaps the best way of illustrating it is by taking the case of an officer who has lately been promoted out of the rank of colonel, and therefore he is no longer affected by it. I refer to Major-general Inglis of Lucknow. Major-general Inglis was promoted to the rank of brevet lieutenant-colonel for distinguished services in the field in 1849, which was five years before this new rule was issued. He had no less than 59 officers, which is a small number compared with what some have had pass over them, placed above him, but he has since had the good fortune to get out of the position of colonel. In consequence of his gallant defence of Lucknow he is now a major-general. But in the same position in which he formerly was, there are 21 officers who had been promoted for distinguished service in the field who have been passed over.

32. I understood the case to be this, that majors having obtained the rank of brevet lieutenant-colonel for distinguished service in the field, were, by the operation of the warrant, deprived of part of their reward, as the brevet lieutenant-colonelcy would take them much slower to the rank of major-general than under the old rule?—Yes, but at the same time a man who had so earned his reward ought not to have been superseded. Her Majesty approved of the warrant, but such is the opinion which, as an officer, one cannot help expressing if one is asked the question.

33. On the other hand, those officers if they reached the command of their regiments would pass over the heads of others?—In the same manner those officers not only would, but they have done so in certain instances.

34. Some of those who had been first injuriously affected have been since advantageously affected?—A few of them have been advantageously affected. A few have gained perhaps more than they lost, while others have never regained what they lost.

35. In the case of Colonel Inglis he has attained the rank of major-general?—Yes, he is benefited by the operation of another clause.

36. Is there any other class of those superseded lieutenant-colonels whose case you wish to describe?—There is another class of substantive majors who were promoted to the rank of brevet lieutenant-colonels for the length of their service as majors and are affected as I have pointed out before.

37. They will become brevet lieutenant-colonels by the operation of the old brevets?—Yes. I have now mentioned three classes. There is still a fourth class, who though they would naturally expect to be promoted, yet will have an asterisk placed against them, from not having served their period of six years as regimental field officers on full pay.

38. (*Mr. E. Ellice.*) How many are there in that class?—34. The four classes are—the officers promoted to brevet lieutenant-colonelcies for distinguished service in the field; the majors promoted to brevet lieutenant-colonelcies under the old brevets; the majors promoted to brevet lieutenant-colonelcies under the old brevets, but who had allowed themselves to be purchased over by junior majors, they having already obtained the rank of lieutenant-colonels; and a fourth class of officers, who have not completed six years of service on full pay—the asterisk officers.

39. (*Chairman.*) What is the existing rule with regard to service as a field officer, which entitles a colonel to obtain the real rank of major-general, and not the asterisk rank?—It is an old rule. I do not know the date of it, but I believe it is as old as 1840 at the least, and which has this effect. It enacts that an officer who has served six years as field officer is entitled to the pay of a major-general upon arriving at the rank, but if he has not served the six years as field officer he is entitled only to the half-pay of his last regimental commission. It has always been considered the standing rule, before the issuing of the warrant of 1854 by which if an officer had qualified himself by serving six years as a field officer he is entitled to all the progress he can make in the service.

40. Do you not think that the rule is a very sound one, as it gives an advantage to those officers who act as field officers over those who do not?—Certainly.

41. When that was introduced it must have pressed with

# The 1858 Evidence.

great hardship upon men who, but for that rule, would have obtained the rank and pay of major-general when they arrived at it?—I cannot deny that, if it did so I will ascertain that.

42. Still, admitting the rule to be good, if your principle that the vested interests of officers in all the conditions of rank in which they are, had been held good at that time, that change could not have been made?—The change was made in this way:—previous to 1814 a general officer received the full or half-pay of his regimental commission. In 1814 special provision was made for general officers, viz., general 1*l.* 18*s.* 0*d.*, lieutenant-general 1*l.* 12*s.* 6*d.*, and major-general 1*l.* 5*s.* 0*d.* a day. On the 18th Feb. 1818 these rates were abolished, and 120 generals, without reference to their rank, fixed at 1*l.* 5*s.* 0*d.* a day, in addition to colonels of regiments. A brevet followed in 1819, when the generals promoted who were on half-pay continued to receive that half-pay only. On 18th November 1822 a warrant was issued granting from 25th December 1821 to all general officers who were on half-pay, the full pay of the last regimental commission. This grant was accompanied by the condition that the officer must have served six years on full pay as a field officer of a regiment or in some military capacity. Therefore the six years' rule did not injuriously affect any existing interests.

43. Is there any other observation that you wish to make as to the six years' rule?—Simply this, that in the course of the conversations which one naturally has, and judging by the feelings of officers with whom I have communicated, they certainly are of opinion that having acted under that rule, and having qualified themselves under that rule, it is a hard case that they should be superseded by others, some of whom have not actually served their time.

44. What is the number of the lieutenant-colonels promoted to colonels who have been promoted over the 115 you have described?—Of the 115, 68 have been promoted, and 47 have not been promoted.

45. Out of the 115 who have been passed over, some again have been promoted, and passed over others?—Some have.

46. What number?—About 30, who were themselves first superseded and afterwards passed over others.

47. But they recovered their original rank, did they not?—Yes, but not their original position; they have attained a superior rank.

48. Possibly they stand as near to the rank of major-general as they would have done under the old system, though the men before them are different men, and the juniors are different?—No, I do not think they have done that; it is possible that some may.

49. Although they will have subsequently the advantage of a rise, upon the whole you think they have still suffered?—Yes. From those 115 which I have mentioned must be deducted the 34 who, by the rules in existence, will be asterisk officers. This leaves, therefore, an effective list of 81 who have been altogether superseded.

50. (*Mr. E. Ellice.*) None of them have since been promoted?—Yes. Of this number 54 have been promoted.

51. (*The Duke of Cambridge.*) There are 81 altogether, and of those 54 have been promoted?—Yes, and 27 are still lieutenant-colonels not promoted.

52. (*Chairman.*) Will they not be promoted?—Some of them may, but many will not until death vacancies promote them in succession. Some of those officers, it is right to say, have not served their six years.

53. Surely all the 81 have?—No, but they are in progress of doing so.

54. (*The Duke of Cambridge.*) They are in a position to complete the term of service?—Yes, they are working up to that point.

55. They are on full pay?—Yes. I have prepared a return, which is before the Commission. I may mention the case of Colonel Garvock, who was promoted for distinguished service; he was passed over by 55, and gradually you get down to the officer who has had the greatest number put over him, which is 151. I may mention that one of these officers is Colonel Franklin, who has served, I think, 14 years as a field officer.

56. (*Sir W. F. Williams.*) In what regiment?—He commands a depôt battalion, I think.

57. (*Chairman.*) There are three officers, Lord West, Colonel Percy, and Colonel Steele, who were made aides-de-camp to the Queen?—Yes.

58. That gave them the colonelcies, did it not?—Yes.

59. That is not under the warrant of 1854?—No, under the old rule.

60. Those three officers are not peculiar to this warrant?—No, but they are affected; they had been passed over before they became aides-de-camp.

61. (*The Duke of Cambridge.*) You place them in the position in which they originally stood before they became aides-de-camp to the Queen?—Yes.

62. The subsequent rank which they may have attained as colonels or aides-de-camp will be very different from this return?—It is different from this return.

63. (*Chairman.*) Can you state to the Commissioners the numbers of the officers who have passed over others?—I will supply that. I did not think that that was of so much consequence, the real consequence is to those who are passed over.

64. What remedy do you propose for those officers who have been passed over?—The remedy that I humbly must suggest (I do not speak invidiously, when I state that officers in the army consider the case unjust)—then in justice, I think, there is but one thing to do, which is to revise the position, and let those officers all hold the relative position which they did hold as lieutenant-colonels.

65. That is, that those who are now colonels, having obtained that rank by three years' service, would be put back to the rank of lieutenant-colonel?—By no means whatever.

66. (*Sir H. K. Storks.*) You would pigeon-hole back every man into his proper place, who was a lieutenant-colonel on the 28th of November 1854?—No, not all in that date.

67. (*The Duke of Cambridge.*) Then will you explain what you mean?—I would take the warrant of 1854, which says that a lieutenant-colonel commanding a regiment is to become a colonel in three years, as the base of the alteration. A certain number of them were promoted on the 28th of November 1854, at which time a good many were passed over. I would begin with the lowest of those officers who were promoted on the 28th of November 1854, and I would promote all those above that officer, and date them from the 28th of November 1854.

68. (*Chairman.*) Then an officer in command of a regiment at the expiration of three years would be promoted to be a colonel, and he would carry up all the lieutenant-colonels senior to him, who had been also promoted to be colonels?—Yes, as is now done by the promotion of an officer to the rank of major-general. When an officer who is qualified for general's rank and pay is promoted, all those who are asterisks above him are promoted at the same time.

69. Would not the operation of that be this, that all lieutenant-colonels in command of battalions would be promoted to colonels on the ground that they had commanded battalions, and all senior to them would be promoted, although they had not commanded battalions, on the ground that they were seniors in the army list to those who had?—Yes, and continue that system throughout the list.

70. You do not propose that as a rule for the future, but it is simply to cover the cases of those lieutenant-colonels who were affected by the warrant of 1854?—Yes; I think from all I have heard, and from the best opinion I can form upon the subject, that it is considered to be a very great hardship by those officers.

71. Do you consider that by that arrangement you will get all those officers to stand in the same relation to one another, just as if the warrant had never been in operation?—No doubt of it. But there is one class of officers who intersect them, and those are officers who have been promoted for distinguished service, and they will occasionally intersect their dates.

72. (*The Duke of Cambridge.*) How do you propose to do that?—In this way, sir. I would take an officer, qualified by regimental command to be a lieutenant-colonel, and those officers promoted to the rank of colonel for distinguished conduct will follow that officer exactly in the same place as now they do.

73. (*Chairman.*) Take a higher case; Colonel Inglis was made major-general for distinguished service?—That is quite a different case. Her Majesty may approve of the distinguished conduct of an officer in the field, and she selects that individual officer for what promotion she pleases.

74. But if an officer being a lieutenant-colonel is promoted to colonel for distinguished conduct in the field, he would not carry anybody up with him; would you not consider that an exceptional case?—Yes, in this way, if what we are calling justice was given to those officers who are passed over, they would have been promoted to colonel before the officers who were promoted for distinguished conduct in

# The 1858 Evidence.

the field, and therefore they would be above them. In that way the officers who are promoted from lieutenant-colonel to colonel will be affected and in no other way.

75. (*The Duke of Cambridge.*) You would make an exception for distinguished conduct?—Yes, but I wish to be understood when I say an exception in favour of distinguished conduct. They would fall into their places according to the alteration of the dates of others.

76. (*Chairman.*) You want to make a retrospective correction of the list before you will deal with those officers as to distinguished conduct?—Yes, but I would not alter the date of a single man who had been promoted for distinguished conduct in the field.

77. You would not apply your rule as to moving those men up to cases where officers were promoted for distinguished conduct in the field?—Certainly not.

78. Why do you make that distinction with regard to distinguished service in the field, because that is also new?—No, I do not think that is new; it may be difficult perhaps to point out instances, and the Duke of Wellington found great difficulty in promoting men from the rank of lieutenant-colonel to the rank of colonel. There are instances, although I cannot exactly point them out. It is quite competent to the Queen to do it.

79. Now it is done directly?—Yes.

80. The cases may be fewer, but it is *pro tanto* just as much an invasion of your principle with regard to the vested rights of the lieutenant-colonels as in the other case?—I do not think so. In the case of the warrant of 1854 it is adopting a new system which is made to apply to a body of men. In the other case it is Her Majesty picking out officers to reward for distinguished service in the field; it may be an individual or a few individuals, but I never heard the slightest opinion expressed in the army against the exercise of Her Majesty's privilege, except in the case of generals, where it is thought they should be supernumerary to the establishment.

81. In the one case it is Her Majesty selecting a few individuals to promote, and in the other it is Her Majesty selecting a class of officers?—No doubt it is so; but that in my opinion is the whole difference in the case.

82. Have you ascertained what would be the effect of such an alteration upon those who would be replaced in their former relative positions, as also upon those who have been promoted under the rule, and who will consequently lose their present relative positions?—I have done so, and I have taken it irrespectively of the Ordnance corps; I have two returns, one including the Ordnance corps and the other without it, but I take it irrespective of the Ordnance corps, as they have their own fixed establishment of generals, and therefore, although of course the promotion in the Ordnance corps might affect command, yet still it does not affect future promotion. Now, for instance, if the rule was altered, and those officers were antedated, Colonel Garvock would be benefited by 28, and so I have prepared the list, showing who would be injured and who would be benefited by the alteration. The case of Colonel Frazer is the case of an officer who retired from the 43d regiment; he did command the regiment, but had not served three years in that capacity, and therefore he was passed over by 62. Macqueen will be benefited by 65. In the case of Colonel Sparks, who was promoted in the last Gazette, he was rather low down in the list, and he had completed his three years in command of a regiment; he will be benefited by the alteration by as many as 89, but it varies between from 30 to 50, speaking of the benefit that it would be, while on the other hand the injury that would be inflicted on those already promoted would vary from one to about 37; that is, the senior Colonel, Jones, will be injured by one, because he only passed over one, whereas Colonel White at the bottom of the list of this number of lieutenant-colonels, promoted before the 20th of June 1854, would be injured by 37.

83. The latter half of the question was, what would have been the effect upon those who had been promoted, and who would now be repassed by those whom they had passed over; do you consider that they would have a grievance?—I cannot say that they would not consider it a grievance, but there could be no grievance in doing justice to officers who have suffered through (allow me to say) the operation of the warrant, and which I believe never to have been intended.

84. (*Sir W. F. Williams.*) Do you not mean an imaginary grievance?—No, the grievance in its effects would be substantial; I cannot but acknowledge that if officers are put back there may be a little substantial grievance, but the whole arguments of the Commissioners of 1854 go to prove that they never intended this injury to be inflicted.

85. (*Chairman.*) How do you establish that?—I found that remark upon part of the 52nd paragraph of the Report, and upon the 53rd paragraph.

86. Be good enough to read those paragraphs?—The 52d is, "We have hitherto considered the question before "us only with reference to the permanent system of pro- "motion to be established. We are, however, aware that "if this were at once substituted for that which has hitherto "been in force, without adopting some means to protect "the interests of those whose prospects would be affected "by the change, much injustice would be inflicted on many "officers who have relied on the continuance of the present "regulations. We are of opinion that a liberal view ought "to be taken of the claims of these officers, and that in "introducing a change, which the public good requires, "they ought to be carefully protected from injury and from "having their just expectations disappointed. We should "therefore humbly recommend to Your Majesty, that "before our suggestions are adopted, should they meet "with Your Majesty's approbation, a general brevet should "be granted; and also that the regulation we have pro- "posed, limiting the advancement of lieutenant-colonels to "the rank of colonel to those only who shall have served "three years in command of a regiment or in staff situa- "tions, as already described, should not apply to existing "lieutenant-colonels or majors including captains and "lieutenant-colonels of the guards." Then the 53rd paragraph goes on to say, "Should these suggestions meet with "Your Majesty's approval, as the number of general "officers would be raised by a brevet above the fixed "establishment we have proposed, we would further re- "commend that every third vacancy only in the general "officers' list should be filled up by the promotion of the "senior colonel, until the excess so created had been got "rid of. With regard to the manner and the numbers in "which existing field officers should from time to time, or "as vacancies occur in the major-general's list, be advanced "to the rank of colonel; we think this is a question which "may most conveniently be left for the consideration of "Your Majesty's servants. It is sufficient that we should "express our opinion that the principle to be followed "ought to be that of not disappointing, so far as it is pos- "sible to avoid it, the fair expectations of these officers, "and of providing for their obtaining without additional "delay that promotion which they would have obtained "under the present system."

87. That brevet was given in consequence of the recommendation?—Yes, I suppose it was, but at the same time the list of generals was at that time so low, the war then commencing, that whether the Commission had sat or not, I apprehend that in justice to the army, and perhaps following the precedent of former times, a brevet must have been given.

88. If it be true that there was great difficulty in getting that brevet, would that change your opinion?—No.

89. In your 115 you do not include any officers who were made lieutenant-colonels in that brevet?—No. I have taken all those who were lieutenant-colonels before that.

90. As I understand you, your proposal is, both in the case of those officers who had not been promoted under the warrant of 1854 and those who first being passed over subsequently were promoted, to restore all to their original position?—Yes, exactly so.

91. (*The Duke of Cambridge.*) Would you put any of those officers over some of those who had gained their promotion by three years' service?—Yes.

92. Then, in point of fact, of those officers who had gained their promotion according to the warrant by having the command of a regiment, or by holding a staff appointment, many of them would occupy a less advantageous position than they at present hold?—Yes, some of them, but not many; the difference to them is not very great, but some who apparently would be benefited will upon investigation be found not to be benefited; they would be slightly injured by putting them back to where they were.

93. (*Chairman.*) You have been looking very closely into the operation of these rules; now, putting aside the case of the vested interest of those officers, and assuming that all you wish is done, under the future operation of the warrant of 1854, will the major-generals be younger than they are now, taking the average deaths at about 20?—I have a list here with regard to the deaths since 1830, showing the number of generals who have died in each year, and also the date of each brevet, and the number promoted under each brevet and the number promoted since. It includes each brevet since 1830, including the brevets that now take place every year.

# The 1858 Evidence.

94. (*The Duke of Cambridge.*) You mean to say the promotions that take place every year?—Yes.

95. (*Chairman.*) Will you state your opinion whether, so far as you can see, the mortality continuing as it does now, major-generals will, under the future operation of the warrant of 1854, arrive at that rank at a lower age than they have hitherto done?—Yes. I think, looking at the lists, that they will, but they are very much mixed, of course. I think if you could keep up a supply—it depends upon that—of 25 or even 20, but 25 would be better, that in the next five years there is a fair prospect of having a sufficiency of major-generals to do the work. I may state to the Commission, that as far as average service is concerned, which is not always a fair criterion, there seems to have been a turning point. I think we have got to the extreme. I think the average service is rather descending now. Younger officers are promoted now more than they were before. The average service of those who were promoted to the rank of major-general in 1846 was 45 years; in 1851 it was 44; in 1854, excluding those who were promoted by selection in 1854, it was 43; the number who were promoted after the brevet of 1854 is not a fair criterion, because there were seven or eight officers who were promoted for distinguished service. In 1855 it was 39 years; in 1856 it was 39, and in 1857 it rose to 42. The average service of all major-generals who were promoted to that rank since June 1854 was 37 years.

96. (*Colonel Eyre.*) Did you intend to state, referring to those officers who were benefited at the expense of their seniors, that putting their seniors into their original places would be any grievance to them?—No. Perhaps I did not explain myself, and I may correct that by saying that perhaps a grievance might be made of it, but I think that the grievance would not be a well-founded one.

97. (*Chairman.*) Have they not derived a certain advantage from the warrant issued by the Queen?—Certainly.

98. Then will it not be a disappointment to them at any rate to find that that advantage after four years is to be taken away from them?—I cannot deny that they may suffer disappointment, but if the Commissioners will recollect, the former Commission particularly held forth that the just expectations of the officers I have adverted to ought not to be disappointed.

99. Take the case of an officer now on the list of colonels within a certain distance from the rank of major-general, will not his just expectations be disappointed if he loses the position which he acquired by the warrant?—I cannot deny that he may suffer disappointment, but I think that it was the intention that the others should not be disappointed.

100. (*Lord Rokeby.*) Are there not cases of major-generals who are so affected by that warrant as to destroy the claim they had under the warrant of May 1825?—Yes, I think that I have heard of two. I do not know how many there are, but it is a peculiar instance, and is not a usual instance. When officers go upon half-pay it is generally by their own option that they do so, but that general order of April 1825 rather requested them to go on half-pay for the benefit of the service, and those officers who went on half-pay under that warrant are upon the half-pay of their former regimental rank.

101. (*Chairman.*) Therefore their grievance is the six years' rule?—Yes, those men were promoted after this warrant was issued, and the grievance is perpetuated in this warrant.

Adjourned.

# REPORT

ON THE

# DISCIPLINE AND MANAGEMENT OF THE MILITARY PRISONS,

1862.

By George V. R. Dunbar, Esq.

*Presented to both Houses of Parliament by Command of Her Majesty.*

TO THE RIGHT HON. EARL DE GREY AND RIPON
SECRETARY OF STATE FOR WAR, &c.

War Office,
My Lord, 24th July 1863.

## Military Prisons for the Year 1862.

The same military prisons were in operation in 1862 as in the previous year. In March 1856 a temporary establishment was formed at Aldershot to provide for prisoners from the camp until the new prisons which were then about to be erected could be completed.

It is to be regretted that this temporary arrangement has continued from year to year. Though it is as well organized as circumstances will permit, and has ever been in excellent order, there do not exist there any adequate means for properly enforcing a sentence of imprisonment.

An admirable site has been selected in the neighbourhood of Reigate, on which it has been proposed to erect a large Central Military Prison for the accommodation of prisoners from Aldershot and the adjacent districts; for it must be borne in mind that the average force of the army in Great Britain and Ireland, which in 1847, when the accommodation was settled, amounted to

67,000 men, has reached during the last five years the following strength, namely:—

| | | | | |
|---|---|---|---|---|
| In 1858 | - | - | - | 100,169 |
| In 1859 | - | - | - | 105,248 |
| In 1860 | - | - | - | 105,157 |
| In 1861 | - | - | - | 93,467 |
| In 1862 | - | - | - | 85,395 |

The erection of the Central Prison at Reigate is therefore urgently required, for there can be no question that the discipline of the army has been prejudiced by the delay in making proper provision for the punishment of offenders. In the meantime a new temporary Military Prison, capable of accommodating 150 prisoners, is about to be opened at Southwark.

---

The Military Prisons in operation in 1862 were as follows:

| | |
|---|---|
| England ..... | Chatham, Gosport, Weedon, Devonport, Aldershott. |
| Scotland ..... | Greenlaw (near Edinburgh). |
| Ireland ..... | Dublin, Cork, Limerick, Athlone. |
| Abroad ..... | Gibraltar, Quebec, Halifax (Nova Scotia), Montreal, St. Elmo (Malta), Vido (Ionian Islands), Bermuda, Mauritius, and Barbadoes. |

Making a total of 19 Military Prisons, of which 10 are in the United Kingdom, and 9 at different foreign stations, the whole being capable of accommodating about 1,800 prisoners (see page 6).

---

## *Statistics of the Military Prisons.*

The following are the principal statistics of the ten Military Prisons at home for the last ten years :—

| | 1853. | 1854. | 1855. | 1856. | 1857. | 1858. | 1859. | 1860. | 1861. | 1862. |
|---|---|---|---|---|---|---|---|---|---|---|
| Total number of prisoners admitted | 3,331 | 3,307 | 5,322 | 6,376 | 5,572 | 6,488 | 6,348 | 6,719 | 6,124 | 5,341 |
| Proportion per cent. of these admissions to the force | 4·47 | 4·78 | 4·48 | 6·84 | 5·62 | 5·97 | 6·4 | 4·08 | 6·56 | 6·28 |
| Daily average number of prisoners in confinement throughout the year | 570 | 504 | 562 | 896 | 744 | 931 | 837 | 1,101 | 1,084 | 972 |
| Proportion per cent. of the average numbers in confinement to the force | 0·76 | 0·73 | 0·47 | 1·24 | 1·91 | 0·86 | 0·79 | 0·67 | 1·16 | 1·39 |
| Average length of sentences | 92 days | 87 days | 77 days | 53 days | 49 days | 53 days | 48 days | 60 days | 57 days | 66 days |
| Punishments inflicted by Visitors for serious offences, *viz.*— | | | | | | | | | | |
| Corporal punishments | 6<br>238 lashes | 4<br>125 lashes | 5<br>175 lashes | 14<br>447 lashes | 5<br>200 lashes | 14<br>540 lashes | 7<br>300 lashes | 21<br>800 lashes | 20<br>810 lashes | 15<br>613 lashes |
| Sentenced to solitary confinement | 17 | 10 | 6 | 27 | 12 | 62 | 20 | 30 | 17 | 23 |
| Sentenced to separate confinement | 9 | 4 | 9 | 9 | 3 | 35 | 7 | 17 | 26 | 22 |
| Sentenced to be put in irons | 2 | 1 | 1 | — | — | 2 | — | 2 | — | — |

The following is a statement of the ages, services, country, and religion of the prisoners admitted in the years 1853—1862 inclusive :—

| | 1853. | 1854. | 1855. | 1856. | 1857. | 1858. | 1859. | 1860. | 1861. | 1862. |
|---|---|---|---|---|---|---|---|---|---|---|
| **Ages.** | | | | | | | | | | |
| Under 20 years | 621 | 962 | 1,577 | 1,436 | 723 | 1,534 | 1,393 | 1,095 | 844 | 511 |

| Greenlaw . | 275 | 210 | 263 | 169 | 390 | 415 | 345 | 352 | 191 | 151 | 334 | 306 | 326 | 331 | 327 | 164 | 301 | 157 | 190 |
| Dublin . . | 518 | 134 | 515 | 143 | 831 | 325 | 972 | 433 | 741 | 222 | 693 | 370 | 707 | 265 | 693 | 170 | 545 | 170 | 495 |
| Cork . . . | 363 | 95 | 410 | 117 | 404 | 151 | 493 | 139 | 356 | 95 | 445 | 203 | 518 | 457 | 518 | 111 | 443 | 26 | 265 |
| Limerick . | 183 | 141 | 172 | 128 | 339 | 217 | 376 | 109 | 102 | 15 | 138 | 137 | 270 | 466 | 269 | 286 | 203 | 180 | 180 |
| Athlone . . | 233 | 476 | 126 | 157 | 262 | 343 | 359 | 555 | 209 | 227 | 203 | 290 | 312 | 435 | 292 | 811 | 250 | 895 | 208 |
| | 3,949 | 2,530 | 3,897 | 2,159 | 5,810 | 2,619 | 7,280 | 2,586 | 5,572 | 1,447 | 7,248 | 2,554 | 7,357 | 3,354 | 7,641 | 3,258 | 7,122 | 2,816 | 6,235 |

The foregoing details exhibit a considerable variation in the prison statistics of 1862 as compared with those of the two previous years; the number of punishments for minor offences has diminished greatly during 1862. The average length of sentences was 99 days in 1849, and 87 in 1854, but it was reduced in 1855 to 77 days, in 1856 to 53 days, in 1857 to 49 days, in 1858 to 53 days, in 1859 and 1860 to 48 days, and in 1861 to 57 days. In 1862 it was 66 days.

### *Crimes.*

The following statement shows the extent of crimes as compared with the force from which offenders have been committed in the years from 1847 to 1862:—

| — | Average Force. | Desertion. | | Absence without Leave. | | Drunkenness. | | Disgraceful Conduct. | | Other Crimes. | |
|---|---|---|---|---|---|---|---|---|---|---|---|
| | | Nos. | Per-centage. | Nos. | Per-centage. | Nos. | Per-centage. | Nos. | Per-centage. | Nos. | Per-centage. |
| 1847 | 67,069 | 1,481 | 2·20 | 823 | 1·22 | 703 | 1·04 | 187 | 0·27 | 656 | 0·97 |
| 1848 | 81,456 | 1,431 | 1·75 | 822 | 1·00 | 851 | 1·04 | 200 | 0·24 | 705 | 0·86 |
| 1849 | 65,897 | 970 | 1·45 | 977 | 1·48 | 795 | 1·20 | 153 | 0·23 | 638 | 0·96 |
| 1850 | 70,345 | 792 | 1·14 | 1,155 | 1·64 | 935 | 1·32 | 116 | 0·16 | 567 | 0·80 |
| 1851 | 69,968 | 642 | 0·91 | 1,115 | 1·59 | 879 | 1·25 | 98 | 0·14 | 532 | 0·76 |
| 1852 | 72,499 | 745 | 1·02 | 1,010 | 1·39 | 909 | 1·25 | 136 | 0·18 | 513 | 0·70 |
| 1853 | 74,476 | 1,069 | 1·43 | 830 | 1·11 | 778 | 1·04 | 111 | 0·14 | 543 | 0·72 |
| 1854 | 69,162 | 1,384 | 2·00 | 813 | 1·18 | 459 | 0·66 | 158 | 0·23 | 460 | 0·66 |
| 1855 | 118,717 | 2,441 | 2·05 | 1,201 | 1·01 | 593 | 0·49 | 275 | 0·23 | 812 | 0·68 |
| 1856 | 72,107 | 2,434 | 3·38 | 1,706 | 2·26 | 809 | 1·12 | 379 | 0·52 | 1,048 | 1·45 |
| 1857 | 76,360 | 1,888 | 2·48 | 1,734 | 2·27 | 619 | 0·82 | 277 | 0·37 | 1,038 | 1·37 |
| 1858 | 100,169 | 3,100 | 3·09 | 1,411 | 1·41 | 529 | 0·53 | 245 | 0·25 | 1,203 | 1·21 |
| 1859 | 105,248 | 2,774 | 2·17 | 1,426 | 1·36 | 636 | 0·61 | 251 | 0·24 | 1,261 | 1·19 |
| 1860 | 105,157 | 2,799 | 2·66 | 1,566 | 1·49 | 779 | 0·75 | 206 | 0·19 | 1,369 | 1·31 |
| 1861 | 93,467 | 2,432 | 2·61 | 1,279 | 1·37 | 736 | 0·79 | 222 | 0·24 | 1,455 | 1·56 |
| 1862 | 85,395 | 1,680 | 1·97 | 1,325 | 1·56 | 894 | 1·47 | 167 | 0·19 | 1,275 | 1·49 |

The above table shows that crime in the army has not been on the increase during the year 1862.

### *Expenditure.*

The following is a statement of the expenditure on account of the Military Prisons during the last thirteen years:—

| Expenses incurred. | 1850. | 1851. | 1852. | 1853. | 1854. | 1855. | 1856. | 1857. | 1858. | 1859. | 1860. | 1861. | 1862. |
|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| | £ | £ | £ | £ | £ | £ | £ | £ | £ | £ | £ | £ | £ |
| The total charge for pay and allowances of prison officers, and for the subsistence and washing of the prisoners, was | 13,291 | 12,451 | 12,598 | 13,488 | 14,359 | 15,933 | 18,746 | 18,232 | 18,125 | 19,849 | 21,624 | 22,431 | 22,359 |
| The full pay and beer money of prisoners in confinement not issued amounted to | 13,738 | 11,329 | 11,390 | 11,925 | 9,999 | 13,868 | 18,722 | 16,008 | 19,577 | 21,959 | 23,225 | 23,359 | 21,200 |

### *Garrison and Barrack Cells.*

In the foregoing details the offences which have led to imprisonment in the Military Prisons at home have been noticed; the following statement, which shows in addition the average occupation in the Garrison and Barrack Cells in Great Britain and Ireland for minor offences, will afford a more complete view

of the state of Military Offences in the United Kingdom since 1847:—

| | Average Number daily of Prisoners in Military Prisons. | Proportion per cent. to the Force. | Average Number of Prisoners in Barrack Cells. | Proportion per cent. to the Force. | Total Average in Military Prisons and Barrack Cells. | Proportion per 1,000 to the Force. |
|---|---|---|---|---|---|---|
| 1847 | 672 | 1·00 | 242 | 0·44 | 914 | 14·4 |
| 1848 | 784 | 0·96 | 334 | 0·50 | 1,118 | 14·6 |
| 1849 | 750 | 1·13 | 275 | 0·42 | 1,023 | 15·5 |
| 1850 | 659 | 0·93 | 277 | 0·45 | 936 | 13·8 |
| 1851 | 550 | 0·78 | 249 | 0·43 | 799 | 12·1 |
| 1852 | 542 | 0·74 | 347 | 0·59 | 889 | 13·3 |
| 1853 | 570 | 0·76 | 211 | 0·32 | 781 | 10·8 |
| 1854 | 504 | 0·73 | 193 | 0·34 | 697 | 10·7 |
| 1855 | 562 | 0·47 | 269 | 0·22 | 831 | 6·9 |
| 1856 | 896 | 1·24 | 100 | 0·13 | 996 | 11·04 |
| 1857 | 744 | 0·91 | 122 | 0·17 | 866 | 11·3 |
| 1858 | 931 | 0·93 | 239 | 0·24 | 1,170 | 11·9 |
| 1859 | 837 | 0·79 | 246 | 0·24 | 1,083 | 10·3 |
| 1860 | 1,101 | 1·05 | 196 | 0·19 | 1,297 | 12·4 |
| 1861 | 1,084 | 1·16 | 216 | 0·28 | 1,300 | 14·4 |
| 1862 | 972 | 1.14 | 191 | 0.23 | 1,163 | 13.7 |

It should be observed that the average number of prisoners in Barrack Cells, as above, includes all, whether by sentence of Regimental Courts-martial or by the award of Commanding Officers.

### *Corporal Punishment.*

The following table shows the numbers of convictions and of corporal punishments inflicted in 1845, the year previous to the establishment of Military Prisons, and during the last thirteen years:—

| | Average Effectives of the Army. | Number of Convictions. | Proportion per cent. to Effectives. | Number of Corporal Punishments. | Proportion per cent. to Effectives. | Numbers marked as Deserters. | Proportion per cent. to Effectives. |
|---|---|---|---|---|---|---|---|
| 1845 | 125,252 | 9,954 | 7·94 | 652 | 0·52 | 786 | ·62 |
| 1850 | 125,119 | 9,640 | 7·7 | 247 | 0·19 | 605 | 0·48 |
| 1851 | 113,844 | 7,954 | 6·98 | 175 | 0·15 | 414 | 0·36 |
| 1852 | 117,643 | 8,312 | 7·06 | 282 | 0·23 | 427 | 0·36 |
| 1853 | 117,953 | 7,933 | 6·72 | 391 | 0·33 | 452 | 0·38 |
| 1854 | 135,884 | 6,051 | 4·82 | 435 | 0·32 | 396 | 0·29 |
| 1855 | 213,166 | 16,184 | 7·59 | 2,217 | 1·04 | 1,517 | ·71 |
| 1856 | 158,476 | 8,368 | 5·28 | 224 | 0·14 | 1,283 | 0·81 |
| 1857 | 163,468 | 12,265 | 7·50 | 545 | 0·34 | 1,290 | 0·76 |
| 1858 | 219,739 | 18,433 | 8·4 | 918 | 0·42 | 2,371 | 1·09 |
| 1859 | 234,186 | 19,262 | 8·3 | 772 | 0·33 | 2,642 | 1·13 |
| 1860 | 228,824 | 17,318 | 7·58 | 651 | 0·29 | 1,870 | 0·82 |
| 1861 | 212,295 | 18,483 | 8·7 | 413 | 0·15 | 2,211 | 1·05 |
| 1862 | 212,718 | 15,445 | 7·3 | 368 | 0·18 | 1,492 | 0·71 |

From these statistics it appears that in 1862 there has been a considerable decrease in the number of convictions, and of cases of desertion.

### *Re-committals.*

The following is a statement of the number of prisoners committed during the years 1853, 1854, 1855, 1856, 1857, 1858, 1859, 1860, 1861, and 1862 who had at any time previously been committed to a Military Prison, showing their ages, services, &c.:—

In this statement is included every soldier who having at any one time been committed to a Military Prison at home or abroad since 1845, when these establishments first came into operation, has again been committed to a Military Prison.

As from the statement showing the crimes for which men have been committed during the year, so from this it appears that absence without leave, drunkenness, and desertion are the prevailing crimes leading to re-committals.

In order, however, to arrive at an accurate judgment of the increase or decrease of re-committals in each year, it is necessary to compare the number of such annual re-committals with the aggregate number of prisoners who have been committed to the Military Prisons since they were first established in 1845.

The following statement shows the number of men committed in 1853, 1854, 1855, 1856, 1857, 1858, 1859, 1860, 1861 and 1862, who have at any time since 1845 been previously committed to any Military Prison; also the numbers re-committed to the same Military Prisons, and the total number of admissions since 1845:—

| Average of total Re-committals to number of Prisoners | per cent. 2·39 | . . | . . | per cent. 2·81 | . . | . . | per cent. 3.35 | . . | . . | per cent. 3·27 | . . | . . | per cent. 2·83 | . . | . . |
| Average of Re-committals to the same Prisons to the number of Prisoners | . . | per cent. 1·18 | . . | . . | per cent. 1·83 | . . | . . | per cent. 1.58 | . . | . . | per cent. 1·47 | . . | . . | per cent. 1·28 | |
| Increase compared with the previous year | . . | 83 | . . | 422 | 171 | . . | 574 | . . | . . | 45 | 15 | . . | . . | . . | |
| Decrease compared with the previous year | 168 | . . | . . | . . | . . | . . | . . | . . | . . | . . | . . | . . | 84 | 86 | |

It might be expected, that as the aggregate number of soldiers who have been once committed must year by year increase for a considerable period after the first formation of Military Prisons, so the number of re-committals would multiply in a corresponding ratio. That this, however, has not been the case is shown by the decrease of the average of total re-committals compared with the total number of admissions into the Military Prisons in 1853.

### *Drunkenness.*

Drunkenness is, perhaps, the most fertile source of military crime; the number of committals for this offence has increased in the year 1862.

The following return will give the particulars for fifteen years, ending 1862:—

| — | England. | | | Scotland. | | | Ireland. | | |
|---|---|---|---|---|---|---|---|---|---|
| | Average Force. | No. of Committals for Drunkenness. | Per-centage. | Average Force. | No. of Committals for Drunkenness. | Per-centage. | Average Force. | No. of Committals for Drunkenness. | Per-centage. |

| The greatest number of prisoners in confinement at any one time was | 904 | 767 | 731 | 801 | 722 | 941 | 1,116 | 1,033 | 1,173 | 1,265 | 1,356 | 1,320 | 1,21 |
| The smallest number was | 413 | 362 | 374 | 369 | 307 | 396 | 649 | 412 | 668 | 779 | 812 | 791 | 6 |
| The daily average number was | 659 | 550 | 542 | 570 | 504 | 562 | 896 | 744 | 931 | 1,039 | 1,101 | 1,084 | 9 |
| The total number treated for sickness was. | 1,113 | 1,035 | 964 | 801 | 815 | 857 | 1,266 | 1,079 | 1,109 | 994 | 1,058 | 863 | 7 |
| The average daily sick was | 26 | 26 | .. | 19 | 19 | 22 | 26 | 18 | 27 | 22 | 25 | 23 | |
| The number of deaths was | 1 | 5 | 3 | 3 | 1 | 5 | 1 | 2 | 2 | .. | 3 | 2 | |

From the above abstract of the Medical Returns of the Military Prisons at home, it appears that the health of the prisoners during the year 1862 was satisfactory. It will be seen that the proportion of numbers treated for sickness to the total numbers in confinement in 1854 was nearly 21 per cent., whereas in 1855 it decreased to about 15 per cent.; in 1856 it was 17 per cent., in 1857 16 per cent., in 1858 15 per cent., in 1859 and 1860 it was only about 13 per cent., and in 1861 and 1862 about 12 per cent.

This result seems to prove that the improved system of prison diet in operation at Aldershot since August 1858, and introduced into all Military Prisons at home in September 1861, has had a beneficial sanitary effect.

*Comparison of the Health of the Prisoners with that of the Troops in Barracks.*

By Returns obtained from the Army Medical Department, showing the average strength of the Troops, the number of admissions into Hospital, and the number of deaths in the several Garrisons in which the Military Prisons at home are situated, during the years 1853, 1854, 1855, 1856, 1857, 1858, 1859, 1860, 1861, and 1862, it appears that—

As stated in previous Reports, there will always appear to be a large number of cases treated in the prisons in proportion to the average strength, in consequence of the continual admission and discharge of prisoners, and of their endeavours to escape a portion of their punishment by coming forward for treatment upon slight grounds.

Of the 863 prisoners treated in the Prisons at home during 1862, the greater part were not even placed in the sick ward; they were prisoners who came forward with slight ailments, for which the Medical Officer treated them without relieving them from the ordinary labour of the prison.

*Diet in Military Prisons.*

The following scale of diet for Military Prisoners was adopted in 1862,[5]

The diet of prisoners not engaged at hard labour is to be as follows at home stations:—

| | | |
|---|---|---|
| Breakfast | 8 oz. of oatmeal<br>½ pint of milk | Daily. |
| Dinner | 9 oz. of Indian meal<br>½ pint of milk | |
| Supper | 8 oz. of bread<br>½ pint of milk | |

And the following scale may be adopted for such prisoners after fifty-six days' confinement:—

Breakfast:—Oatmeal - - 10 oz.
Dinner:—Indian meal - - 12 oz.
Supper:—Bread - - 8 oz.
With ½ pint of milk to each meal.

Prisoners of the first class not engaged at hard labour shall be allowed a meat dinner, as detailed below, on Sundays.

The diet of prisoners in the second and third classes employed at hard labour shall be as follows on two days of the week, viz. Tuesday and Thursday, at home stations:—

| | | |
|---|---|---|
| Breakfast | 8 oz. of oatmeal<br>½ pint of milk | Daily. |
| Dinner | 8 oz. of beef, without bone, before cooking, 2 lbs. of potatoes or 8 oz. of bread, 1 pint of soup thickened with 1 oz. of oatmeal, and 2 oz. of vegetables per man, seasoned with pepper and salt | |
| Supper | 8 oz. of bread<br>½ pint of milk | |

On other days of the week it shall be the same as for prisoners not at hard labour. The first class shall be allowed an additional meat dinner on Sundays.

When it may be deemed necessary by the medical officer, for the health of a prisoner, to substitute occasionally bread for oatmeal or Indian meal, the following will be the proportion:—

10 oz. of bread in lieu of 8 oz. of oatmeal.
12 oz. „ „ 9 oz. of Indian meal.
8 oz. „ „ 6 oz. ditto.

If in solitary or close confinement for a prison offence, or placed on bread and water as a punishment:—

| | |
|---|---|
| 1 lb. of bread, with such quantity of water for drinking as a prisoner may desire to have, for the first three days of such confinement, which may, however, be extended to seven days, at the discretion of the Visitor; and for the remaining period the same diet as for prisoners not engaged at hard labour | Daily. |

A statement of the number of cases in which the extension beyond three days is awarded should be included in the Medical Officer's Quarterly Report.

The bread to be of the quality of ration bread.

On foreign stations the above scales of diet may also be used when deemed expedient; but if not, such diet only shall be used as may have received the sanction of the Secretary at War.

Every prisoner shall be allowed a meat dinner on Christmas Day.

TABLE showing the Number of Prisoners discharged who GAINED or LOST WEIGHT, from 1 to 27 lbs. each, during the years 1853 to 1862.

| 1858 | 953 | 2,923 | 2 13 | 4,782 | 28,987 | 6 1 | 399 | 110 |
| 1859 | 1,300 | 3,779 | 2 14 | 4,637 | 23,057 | 5 4 | 433 | 67 |
| 1860 | 1,239 | 4,195 | 3 5 | 4,861 | 27,334 | 5 9 | 416 | 70 |
| 1861 | 1,266 | 4,412 | 3 7 | 4,561 | 25,151 | 5 7 | 398 | 40 |
| 1862 | 1,303 | 5,103 | 4 0 | 3,619 | 18,187 | 5 1 | 353 | 36 |

The adoption of an improved scale of diet has considerably diminished the average loss of weight, and it is satisfactory that the number treated for sickness during the year 1862 was proportionately less than in any year since 1850 excepting 1861.

| | 1850. | 1851. | 1852. | 1853. | 1854. | 1855. | 1856. | 1857. | 1858. | 1859. | 1860. | 1861. | 1862. |

| Number of sick per cent. to the number of prisoners admitted . | 31·2 | 31·6 | 29·0 | 24·0 | 24·6 | 16·1 | 19·07 | 19·3 | 17·9 | 15·7 | 15·8 | 14·1 | 14·5 |

*Punishments in the Army.*

The measures for the improvement of the condition of the soldier which have been and still are in progress, and the discharge of many of the worst characters from the army, must be allowed their due weight in judging of the present state of discipline by the amount of punishment.

But a comparison of the number of sentences, previous to the establishment of Military Prisons, and at the present time, affords a very favourable indication of the change that has taken place.

In 1843 the number of soldiers imprisoned at any one time under sentence by Court-martial, in Civil Prisons, exclusive of those who might be in confinement by order of Commanding Officers, was in the ratio of 20 in 1,000, and at the same time the number of corporal punishments amounted to annually about 5·2, making 25·2 per 1,000.

In the three years from 1851 to 1854 the number of imprisonments was reduced to 11 per 1,000, and in the four years from 1850 to 1854 the average number of corporal punishments had been reduced to 2·5 per 1,000, being a little more than one half in both cases, and making a total of 13·5 as compared with 25·2.

During the year 1862 it will be found, by referring to the Tables, page 10, that the average number undergoing imprisonment at any one time in the Military Prisons and Barrack Cells amounted to 13·7, and the total corporal punishments in these years amounted to 1·8, making a total of 15·5 per 1,000 as compared with 25·2 in 1843.

---

The recent and sudden death of Major General Sir J. Jebb., K.C.B., Inspector General of Military prisons, causes this report for 1862, prepared by Mr. Fitz Patrick of my subdivision, to be

less copious than the reports of former years, but it is complete in all the statistics which exhibit the effects of the system in operation for the punishment and reformation of military criminals.

I have the honour to be,
My Lord,
Your most obedient humble servant,
G. V. R. DUNBAR.

# THIRD REPORT

OF THE

# ROYAL COMMISSIONERS OF THE PATRIOTIC FUND

TO

# HER MAJESTY THE QUEEN.

---

We, Your Majesty's Commissioners for the administration of the Patriotic Fund for the relief of widows and orphans of soldiers, sailors, and marines, who lost their lives in the late war with Russia, have the honour humbly to present to Your Majesty our Third Report.

2. Your Commissioners, before proceeding to the details of the Fund, must take this opportunity of humbly expressing their deep sorrow at the loss sustained by Your Majesty, and the whole nation, by the death of that illustrious Prince who presided over this Commission with so much ability, and devoted to its business so much care and attention.

Amount of contributions.

3. In our Second Report to Your Majesty, on 9th February 1858, we stated that 1,453,045*l.* had been contributed to the Patriotic Fund; since then the sum of 6,642*l.* has been received, making the total amount of contributions on 31st December 1861, 1,459,687*l.*

Appendices Nos. 1, 2, and 3.

4. A statement of the receipts in each half-year since our former Report, and an account of the investments, together with a statement of the expenditure, will be found in the Appendix to this Report.

Boys' school.

5. The sum set apart to accumulate, for the purpose of establishing a school for boys, now amounts to 32,000*l.*

Nominations to Naval School at New Cross.

6. Your Commissioners have appropriated the sum of 8,000*l.* for the purchase of seven nominations in the Royal Naval School at New Cross, for the sons of officers in Your Majesty's Navy.

New members of Committee.

7. Vacancies having occurred in the Executive and Finance Committee by the death of Major A. J. Little, R.M., and the resignation of G. C. Glyn, Esq., M.P., and W. G. Anderson, Esq., the following gentlemen have been appointed to fill their places, viz.:—

Major-General A. J. Lawrence, C.B.;
Captain J. W. Tarleton, R.N., C.B., and
Rev. G. R. Gleig, Chaplain-General to the Army.

The Rev. J. Woolley, LL.D., one of Your Majesty's Inspectors of Schools, has also been added to the Committee.

Assets and liabilities.

8. An estimate of the probable assets and liabilities of the Fund will be found in the Appendix (No. 4).

Number of widows and orphans relieved.

9. The total number of widows of non-commissioned and petty officers, privates, and seamen, placed on the lists for relief is 3,455, and of children, 4,513, (including 172 who have lost both parents), being an addition of 299 widows, and 507 children, since the date of last Report.

Deaths.

173 widows and 419 children have died since the commencement of the administration of relief, of whom 129 widows, and 224 children have died since the date of last Report.

Number of children provided for.

10. Allowances to children have been discontinued under the following circumstances:—

| | |
|---|---|
| Apprenticed to trades | 139 |
| Entered service | 110 |
| „ army | 11 |
| „ navy | 38 |
| Pupil-teachers | 11 |
| Government schools | 90 |
| Above age | 210 |
| Total | 609 |

Number of re-marriages.

1,302 widows have re-married. Some of these have lost their second husbands, and have returned to their position on the fund.

Officers' widows and children.

11. There are 130 officers' widows, and 225 officers' children in receipt of allowances according to the scale sanctioned by the Royal Commissioners (30th April 1856). Additional allowances are given for the education of 30 of these children, and there are also 21 in the following institutions:—

5 Royal Naval Female School.
6 New Cross.
10 Wellington College.

21

Lord Northwick's offer of house for school.

12. Lord Northwick generously offered to place Thirlestane House at Cheltenham at the disposal of Your Commissioners for the purpose of establishing a boys' school, but finding that a considerable sum would be necessary to make the house suitable, and that no longer term than seven years could be obtained from the ground landlord, Your Commissioners were reluctantly compelled to decline Lord Northwick's offer.

Temporary boys' school.

13. The Executive and Finance Committee have, however, availed themselves of our sanction to form a temporary boys' school, and have taken a house at Wandsworth for that purpose, on a lease of ten years, where are at present 146 boys.

Bequest of Don F. Rodriguez, native of Manilla.

14. Don Francisco Rodriguez, a native of Manilla, who died on the 30th April 1857, having bequeathed the whole of his property, amounting to between 800*l.* and 900*l.* a year, to be applied to the relief of "the families of English subjects wounded or dying "in the wars," and having named as his executors Your Majesty's Consul, and certain English residents of Manilla, the matter was reported by the Consul to the Government. A reference was made by Your Majesty's Government to ascertain if the administration of this property could be undertaken at the Office of the Patriotic Fund.

The subject having been communicated to His Royal Highness the Prince Consort, he desired that a reply should be made to the effect, that the Royal Commissioners, anxious to acknowledge the compliment paid to the nation by the deceased, would gladly undertake the distribution of the property, and that for this purpose a separate account should be kept, to be called the "Rodriguez Fund Account." Owing to disputes on the part of some of the relatives of the deceased, no money has yet been transferred to Your Majesty's Commissioners; but all litigation has recently been set at rest by a decree of the Supreme Court at Madrid, that the will of Don Francisco Rodriguez is perfectly valid.

Royal Victoria Patriotic Asylum.

15. The Royal Victoria Patriotic Asylum, of which Your Majesty was pleased to lay the first stone on the 11th July 1857, was opened for the reception of the orphan girls of the fund on the 1st July 1859, when 150 were admitted: the number has gradually increased to 268, and as soon as the Infirmary is finished, the full number of 300 will be completed.

See Appendix No. 5.

16. In the month of January last one of the inmates of this asylum was unfortunately burned to death while in solitary confinement. An inquest was held, and a verdict of "accidental death" was returned; but the Executive Committee, after a careful investigation of the circumstances, having decided that two of the schoolmistresses—the one in charge of the Asylum during the temporary absence of the Lady Superintendent, the other, to whom the first alarm was communicated—had been culpably remiss in disregarding the information they received, dismissed them both.

17. To provide in future for the better supervision of the domestic arrangements of the establishment, a Committee of thirteen ladies was formed to visit the Asylum monthly, and to report their recommendations to the Executive Committee.

The Ladies' Committee held two meetings at the Asylum, and subsequently reported defects in the management of the Institution, which led them to consider it indispensable that the Lady Superintendent and the Chaplain should be removed.

18. The Executive Committee investigated the matters so reported to them, and the general condition of the Asylum, and came to the following resolution:—

Resolved,—"That the Committee, having carefully considered the communications "and evidence which have been submitted to them with respect to the management "of the Royal Victoria Patriotic Asylum, and certain punishments which have been "inflicted, disapprove and regret the conduct of the Lady Superintendent and the "Chaplain in some instances. But considering the peculiar circumstances under "which the schools have been carried on in the absence of regular supervision, "excepting that of the Senior Honorary Secretary of the Royal Commission, the "Committee are of opinion that a recurrence of these faults may be prevented by

" improved regulations and proper inspection, and that therefore it is not necessary to
" proceed to the extreme measure of now calling upon either the Lady Superintendent
" or Chaplain to resign their situations."

The Committee have, accordingly, prepared and laid before us an amended code of rules for the future government of the Institution.

19. After perusing the documents which had been submitted to us, and hearing the further explanations of the Chairman of the Executive Committee, a majority of the Royal Commissioners, present at the meeting when the subject was discussed, approved of the decision at which the Committee had arrived.

20. We regret to have to inform Your Majesty that four of the ladies were so strongly convinced that a change in the persons intrusted with the management of the Institution was absolutely necessary for the welfare of its inmates, that they thought it their duty to decline serving any longer on the Visiting Committee, when they learned that the Executive Committee had come to the conclusion that no such change should be made. Three more of the ladies took the same view of the necessity of the measure they had recommended, but suspended their resignation until it should be ascertained whether we should confirm the decision of the Executive Committee. On being informed that we had done so, they have also signified to us that they can no longer act as members of the Visiting Committee of Ladies, so that we have lost the services of a majority of those originally appointed.

We think it right to lay before Your Majesty, in the Appendix to this Report, the correspondence which has led to this unfortunate result. Appendix 6.

21. We have the honour to inform Your Majesty that the Bishops of London and Winchester have been requested by us to visit the Institution at their convenience, from time to time, and to report anything that may come under their observation to the Executive and Finance Committee, and that these Prelates have signified their willingness so to act.

22. We insert in the Appendix the Report of the Rev. F. C. Cook, one of Your Majesty's Inspectors of Schools; and we hope that, with the revised rules carried out under regular and periodical inspection, the condition of the Asylum will be hereafter in every respect satisfactory, and give full effect to the benevolent purposes for which Your Majesty has honoured it with Your Royal patronage and support. ## APPENDIX V.

*Surrey* } INFORMATIONS of Witnesses taken on Oath at
*to wit.* } the ROYAL VICTORIA PATRIOTIC ASYLUM, in the Parish of Wandsworth, in the County of Surrey, the Tenth day of January 1862, before me, WILLIAM CARTER, one of Her Majesty's Coroners for the said County, on view of the Body of CHARLOTTE JANE BENNETT, then and there lying dead.

ELIZABETH M'DONNELL sworn, saith—I am a single woman, I am a servant here as head housemaid; the person dead I knew; her name Charlotte Jane Bennett, aged 17 years last birthday; she was a servant, but not receiving wages. On the evening of Tuesday last, the 7th instant, at about 25 minutes past 8 o'clock, I took some tea to a room in this establishment for her. I had had a knowledge she had been in that room from 9 o'clock a.m. (for punishment, having been insolent to the laundry-woman); that under the chaplain's direction. I having a key proceeded to open the door; yet when at the door I smelt a smell of burning. I did not see any fire or hear any noise. On opening the door I found the gas was alight, and I saw her, deceased, lying on the boarded floor on her back, and in a state of nudity, by reason of her clothes having taken fire. A small portion of her chemise only on her body, except her boots and part of her stockings. She appeared dead; nothing was found covering her. I went for Mr. Kirkby, the chaplain; I had seen her at ½ past 4 o'clock that afternoon; she was then in good health; she was alone. I had retained the key all day, so that no one could get access to her. I had not lit the gas; it was not burning when I last saw her alive. The room is called the bath-room, therein being a fixed bath, with taps to supply it with water, hot and cold. There was no water in the bath. She was greatly burnt on her body, arms, legs, and face. I knew there were lucifer matches on the mantelshelf, also a fire in the room composed of coal. There were newspapers in the room, and therefore had the means of lighting the gas. The gas burner projects from the wall, the supplying pipe being in the wall; that burner just at the side of the window of the room. She was lying extended from the window towards the door, her feet being next or under the window. There was a chair by her side, on its side. The burner was about seven feet from the floor. Her stature was about five feet. She could not have lighted the gas without the use of the chair, or standing on something. There was a blind to the window, which had been consumed by fire, the roller remaining up as fixed. She was there all the day of Monday, from 11 o'clock a.m. to 10 o'clock at night. Then she went to her bedroom, and at nine o'clock the next morning went of her own accord thereto, as desired by the chaplain. I had supplied her with her meals; she was not supplied with needlework, but had a book. She, however, appeared quite calm in mind and quite happy. She did on the Tuesday afternoon say she should be glad when the chaplain came to let her out, as she was tired of stopping, and was sorry for her misconduct. I feel confident she has not done any act to cause her own death. The cause of the fire, in my opinion, arose, that she got on a box that contained papers, which was immediately under the gas-light to light the gas, using a match or paper: the window blind ignited, being of cotton material, and in her trying to extinguish it her clothing caught. The bath-room is on the second floor in front; the room over is a work-room, and persons were therein from half-past six o'clock, not after, as the needlewoman was out. There was a small portion of fire near her, arising from the remains of her clothing. I conceive she would have lighted the gas at five o'clock. She did partake of her dinner; it was the first occasion after being locked up. The punishment was quite necessary.

WILLIAM KIRKBY sworn, saith—I am a clerk in holy orders, and chaplain to this establishment. The deceased person I knew as being here as an orphan, and to be instructed in household duties. On last Tuesday evening the last witness came to me, and upon her information I accompanied her to the bath room. I there saw the deceased lying on the floor as described. I have no doubt she must have lost her life from injuries by fire. I noticed the window blind was wanting, as having been consumed by fire. I noticed the window, the chair spoken of, and noticed one of her knees through the bars of the chair; the bottom of the chair was burnt out, and the back of it also. I did find the remains of a lucifer match under the gas burner. The blind was linen, and on a spring roller. I have noticed charred remains of the blind on the roller; so that my belief is, that in lighting the gas with a match she let it drop, and in getting off the box her clothes ignited; that she had ran to the door—as there were marks on the floor, with slight scorching of the paper—then had returned to the window for air, the flames arising from her clothes igniting the blind, and then fell from suffocation and died. I had placed her in the bath room, as having witnessed some insubordination on her part on the day of Monday, as a punishment by separation, as necessary for the well being of the establishment; but I did not see her after that time alive, yet knew of her by report. The smoke had cleared away, so that the fire had ceased some time to her death being discovered. I have known her for six months. I feel satisfied it was the result of accident.

SARAH REARDON, sworn, saith—I am sixteen years of age, and am now a servant here, having been a pupil. I knew the deceased person. I had been for a holiday from Monday last to the following day evening, returning at a little before five o'clock. I understood the deceased was locked up in the superintendent's bath room. At about six o'clock I was in a room immediately under that bath room, and I then heard a screaming and a knocking over head. A girl named Walters came in and said, I wonder what that girl is doing walking up and down now. I went outside and went with Jane Duncan half way up stairs. At the moment one of the teachers passed across the hall and called to Duncan, who went away, and I returned to the portress's room, yet I did not make known to any one what I had heard.

Verdict of *Accidental death.*

## APPENDIX VI.

[*Private and Confidential, for the Information of the Royal Commissioners.*]

From MINUTES of EXECUTIVE and FINANCE COMMITTEE.

25th January 1862.

RESOLVED:—That there shall be a Visiting Committee of Ladies.*

The duties of the Ladies' Committee will be—

To exercise a supervision of the domestic arrangements of the Institution, as relating to the care of the children of all ages, in health and sickness; their diet, dress, occupations out of school hours, and their training for domestic service or industrial employments.

The Ladies' Committee will please to embody their recommendations in writing, and communicate them to the Chairman of the Executive and Finance Committee for consideration.

The ladies will meet as a committee, by summons, on the second Tuesday of each month, and on such other occasions as they may think fit. Three ladies will form a quorum.

They will keep a minute book, and enter all their observations and recommendations in writing.

| Meeting of Ladies' Committee, 11th Feb. 1862. | Decisions of Executive and Finance Committee thereon, as communicated to the Ladies by Letter of 8th March 1862. |
|---|---|
| It was resolved:— | |
| 1. That separation from their companions at meals, during exercise, and at other times, be generally adopted as a mode of punishment. | It is already in practice. |
| 2. That any girl whose conduct shall have been refractory, or otherwise unmanageable, shall be brought before the Ladies' Committee at their next Monthly Meeting. | In any such case the girl is to be brought before the Ladies' Committee, and the ladies are requested to take notice of such continued refractory conduct made known to them by the Lady Superintendent; and if necessary to report thereon to the Executive Committee. |
| 3. That the Senior Mistress of the Senior School be appointed to take charge of Miss Clavell's duties, during any temporary absence,—to whom alone she should delegate her authority. Miss Clavell and this Mistress should not be allowed to absent themselves at the same time. | In the absence of Miss Clavell, the Senior Mistress present in the Establishment is to take charge of her duties. |
| 4. That girls be allowed to appeal to Mrs. Kirkby, in the event of their feeling aggrieved, or of their desiring further advice than that which they could otherwise obtain. | The Executive Committee conceive the object the Ladies' Committee had in view will be obtained by the alteration which they have authorized in Byelaw No. 16, which is as follows:—<br>"That the mistresses are to endeavour to obtain the confidence of the children placed under them, and to encourage them to state any difficulty they experience, or anything for which they may think they have a ground of complaint, and the children shall be allowed to appeal to the Lady Superintendent, in the event of their feeling aggrieved, or of their desiring further advice than they could otherwise obtain."<br>Adopted. |
| 5. Any complaint made by mothers respecting their children should be laid before the Ladies' Committee, at their next Monthly Meeting. | |

From Minutes of Ladies' Committee.

11th March 1862.

Read a letter from Lord Colchester, Chairman of the Executive and Finance Committee, enclosing the decisions of that Committee upon the suggestions of the Ladies' Committee, and the regulations to be observed when necessary to place a girl in solitary confinement.

The suggestions of last Meeting having been again read over, it was

Resolved,—That the first suggestion, as recorded, did not adequately represent the views of the Ladies' Committee with respect to punishment by solitary confinement; as the ladies were then of opinion that solitary confinement ought not to be resorted to as a mode of punishment.

The above Resolution was carried by the votes of six ladies, three being of opinion that solitary confinement might be resorted to under certain restrictions.

With reference to the decision on suggestion 3 of last Meeting, it was

Resolved unanimously, — That the ladies are still of opinion that, in the absence of the Lady Superintendent, her duties ought only to devolve upon the Senior Mistress of the Senior School; and that the Lady Superintendent and that Mistress ought not to be absent at the same time.

Miss Clavell, the Lady Superintendent, having been called in, and requested to state if there was anything she wished to bring under the notice of the Ladies' Committee, stated that several cases of petty theft had recently taken place, but she had failed in discovering any trace of the culprit. She further stated that such things had taken place for a long time past. It was thereupon

Resolved unanimously,—That the subject ought to be represented to the Executive Committee, for them to take such steps as they may consider necessary to prevent the recurrence of such practices, and to request the gentlemen to be pleased to acquaint the ladies of the result of their endeavours.

The Ladies' Committee examined ten girls in reference to the above subject.

It having come to the notice of the Ladies' Committee, in the course of the inquiry into the petty thefts, that the Laundress has been allowed to take certain girls out of the Institution for a walk, when they have opportunities of spending money, and of bringing sweetmeats and other things into the Asylum—they beg to record their opinion that such a practice is open to grave objection, and ought not to be permitted in future.

The Rev. Mr. Kirkby was requested to give the ladies information on one or two matters, and a conversation took place with him on the subject of the thefts; and he was requested by the Ladies' Committee to write at once to Sir Richard Mayne to obtain the services of a detective in the hope of tracing the culprit or culprits.

A case having been mentioned of a girl (Elizabeth Thompson), who has been in service and returned to the institution, in consequence of dishonesty—

The Ladies' Committee suggest that the return to the Asylum of girls who have not conducted themselves satisfactorily whilst in service is objectionable, and likely to lead to serious consequences by the effect they may have on other girls.

Miss Coutts having requested to see the record of punishments in the institution, Mr. Kirkby produced the small book which he has kept for his own satisfaction; and as it appeared that punishments had taken place, which she had understood were not permitted, it was

Resolved,—That the Ladies' Committee suggest that this book should be called for and examined by the Executive Committee.

From a Portion of the Ladies' Committee.

27th March 1862.

We the undersigned Ladies of the Committee for the supervision of the Victoria Asylum at Wandsworth, being aware that in consequence of circumstances lately brought to light with regard to the internal management of this institution, the Executive Committee intend to hold a Meeting on Friday next, the 28th March, for the purpose of taking into consideration the reorganization of this Establishment, we feel this to be the proper time to lay before the Executive Committee the expression of our opinion, and to state at once the circumstances under which we could not consent to continue the exercise of our functions.

Being convinced that the Institution has been entirely mismanaged, we could not continue to act with the parties to whom the Executive Committee has hitherto intrusted its local management. We could not place confidence in the channel of communication which has hitherto kept the Executive Committee in ignorance of so many important details with regard to its internal administration.

We feel that the Chaplain has assumed powers not authorized by the Executive Committee—that his punishments have been severe and totally unsuitable and revolting, especially in a girls' school.

We feel that the Lady Superintendent is unequal to the control of such an establishment, as not possessing sufficient judgment of her own, and as having consented to follow out unauthorized orders, which she herself felt to be objectionable.

We are of opinion that, in a girls' school, a woman should be the responsible head of the establishment. With regard to corporal punishment, we feel it to be totally inadmissible in a girls' school, and we have ascertained that in the Metropolitan Workhouse and Pauper Schools, an *absolute prohibition* exists against its infliction on any female child.

Such being our opinion, we should feel that too heavy a responsibility would be thrown upon the Ladies' Committee, unless a very different system of management were to be adopted, and that they were to be relieved from the fear that any degree of concealment from the Executive Committee should again occur.

Signed by,

| | |

| The Hon. Miss Sugden. | Mrs. Brown. |
| Mrs. Adair. | Mrs. Prescott. |

### Reply from the Executive and Finance Committee.

Madam, 28th March 1862.

I this day read to the Executive Committee the letter signed by yourself and other ladies of the Committee, relative to the conduct of the Chaplain and Lady Superintendent of the Victoria Asylum.

The Committee desire to thank the ladies for their opinion expressed on the conduct of the Asylum, but they are unable to receive the letter officially, not being agreed to at a meeting of the Ladies' Committee regularly summoned. They, however, have under their consideration the whole question of the future government of the Asylum, as well as the conduct of the present Chaplain and Lady Superintendent, and when they have arrived at a decision, I shall have the honour to inform you of the result.

I am, &c.

(Signed) Colchester,

Chairman of the Executive and Finance Committee.

---

### From Minutes of Meeting of Ladies' Committee.

1st April 1862.

1. Some misapprehension having arisen respecting the meeting of the Ladies' Committee of the 27th ultimo, in consequence of which their letter embodying the results of their investigations at the Royal Victoria Patriotic Asylum could not be officially received, as having been drawn up at a meeting not regularly summoned, the monthly meeting has been called to rectify that informality.

2. The ladies are aware that the Executive Committee have hitherto depended for all local information with regard to the Wandsworth Asylum upon the Honorary Secretary, Captain Fishbourne, selected by them as their channel of communication with the Asylum, whilst they have held their meetings in New Street; where they have lately examined the Chaplain, the Rev. Mr. Kirkby, and the Lady Superintendent, Miss Clavell. When the Ladies' Committee was appointed by the Executive Committee, it became their duty to go down to the Victoria Asylum at Wandsworth, and there to see with their own eyes and hear with their own ears, and to report to the Executive Committee the result of their investigations, and the opinions to which they have been led.

3. The disclosures which took place at their second meeting at Wandsworth on the 11th of March occupied so much of their attention, that the Ladies' Committee had not time to record on the minutes the very grave objections they entertained against the existing system of management at the Asylum, and their unwillingness to act with the present officials.

4. It was on this account that they determined to embody these opinions in the letter signed by eight of the ladies at their meeting on the 27th ult. (*vide* p. 10), to which they now beg, for the above reasons, to draw the attention of the Executive Committee (copy appended to the minutes); for although this letter has been set aside on a point of form, the Ladies' Committee feel they should be extremely negligent of their duty if, by any delay in the rectification of their error, the vital interests of the Royal Victoria Patriotic Asylum should be sacrificed to a technical difficulty. The gentlemen at present possess no other evidence of the opinion of the Ladies' Committee as to their conviction of the utter hopelessness of the success of their best endeavours until a system of moral control shall be established over the children—until the religious instruction which they receive shall no longer be, as at present, apparently unconnected in their minds with their practical duties—and until the whole tone of the establishment shall become more in accordance with the recognised principles of female training.

5. However, from the increased activity of the Executive Committee since they have been made aware of the real condition of the school, the ladies have every reason to flatter themselves that the whole institution will, ere long, be placed on a thoroughly satisfactory footing,—an opinion in which they are confirmed by the intimation which they have received, that the whole constitution of the Asylum, as well as the conduct of the officials, is under full consideration.

6. The ladies conclude that, after the Meeting of the Royal Commissioners, they will receive from the Executive Committee an announcement of the changes and reforms to be made in the Asylum, until which period they deem it advisable to suspend the exercise of their functions.

The foregoing paragraphs were adopted by Lady Colchester, the Hon. Mrs. Wellesley, the Hon. Miss Sugden, Mrs. Adair, Miss Coutts, Mrs. Brown, Mrs. Cook, and Mrs. Prescott. Lady Sarah Lindsay and Mrs. Lefroy, although agreeing on the other points, deferred their assent to the last part of the third paragraph until they knew the result of the further investigations which they believed were in progress by the Executive Committee.

Mrs. Fishbourne dissented, feeling that she could not pass judgment, as she knew so little of the working of the Institution.

---

### From Executive Committee to Ladies' Committee.

Madam, 9th May 1862.

I have the honour to inform you, at the request of the Executive Committee of the Royal Patriotic Fund Commission, that, with reference to communications they have received from the Committee of Ladies, they have unanimously adopted the following Resolution:—

"Resolved, — That the Committee, having carefully
" considered the communications and evidence which
" have been submitted to them, with respect to the
" management of the Royal Victoria Patriotic Asylum,
" and certain punishments which have been inflicted,
" disapprove and regret the conduct of the Lady Super-
" intendent and the Chaplain in some instances. But
" considering the peculiar circumstances under which
" the schools have been carried on in the absence of
" regular supervision, excepting that of the Senior
" Honorary Secretary of the Royal Commission, the
" Committee are of opinion that a recurrence of these
" faults may be prevented by improved regulations and
" proper inspection, and that therefore it is not neces-
" sary to proceed to the extreme measure of now calling
" upon either the Lady Superintendent or Chaplain to
" resign their situations."

In arriving at this decision, the Committee show that they are not insensible of the objectionable nature of facts which have been brought to their knowledge by the Committee of Ladies.

The Committee feel under great obligations to the Committee of Ladies for the investigations they have made, and for the information they have given; and they earnestly hope that services so valuable may be hereafter continued. The importance of the assistance and advice of ladies in the conduct of such an institution cannot be estimated too highly.

They also indulge a hope that, on reconsideration, the Committee of Ladies will not dissent from the course which the Committee deem it their duty to take.

While the Committee are compelled to view with regret the particular circumstances referred to, they feel bound to make allowance for the difficulties which are incidental to the commencement of such an establishment, and also for the want of previous experience on the part of both the Lady Superintendent and the Chaplain; and they must also express their belief that, although there may have been want of discretion in some part of the conduct of those officers, they have both of them been sincerely desirous faithfully to perform their duties.

The Committee therefore feel that, under the whole circumstances, they will best consult the permanent interests of the Institution by looking to the future rather than to the past; hoping that with improved Rules, and under more effective superintendence, both Miss Clavell and Mr. Kirkby will be able efficiently to fill their respective offices.

The Committee had hoped to send, together with this letter, a completed revision of the rules and regulations; but finding that more time will be required than had been anticipated, they prefer to forward at once this communication to the Ladies' Committee.

I have, &c.

(Signed) Colchester.

Chairman of the Executive and Finance Committee.

To the Lady presiding at the Committee of Ladies.

---

### From Minutes of Ladies Committee.

10th May 1862.

Read letter from Chairman of Executive and Finance Committee, dated 9th instant, enclosing a copy of the resolution of that date respecting the Lady Superintendent and Chaplain.

After consideration, the following letter was signed by a portion of the Ladies' Committee:—

### To the Executive Committee.

10th May 1862.

We, the undersigned Ladies of the Committee, having received your communication of yesterday's date, beg to make the following statement:—

When the fatal event which occurred at the Victoria Asylum, at Wandsworth, in January last, first revealed the

mismanagement and confusion that prevailed in the internal organization of that institution, it was considered desirable that a Ladies' Committee should be formed, which would visit the school, and report to the Executive the result of their observations on each occasion.

These visits of the Ladies' Committee having successively brought to light a variety of circumstances tending to prove the total want of judgment and discretion of the Chaplain and Superintendent (some of these of a nature so opposed to all notions of delicacy and propriety as to betray their general unfitness for the responsible charge of female orphans), and also their frequent departure from the rules and regulations appointed for their guidance in the management of the school, *eight* of the Ladies' Committee recorded to the Executive their opinion of the inefficiency of these officials, and their unwillingness to act with persons whose ideas on the subject of female training and moral education were so highly erroneous and objectionable, and who had displayed such want of energy and resource when a system of thieving had long prevailed in the school, both as to making any efforts to trace the offenders, and as to any endeavours to impress upon the minds of the children a sense of the gravity of their offence.

The ladies were also of opinion that the head of such an institution should have been a woman (more properly a widow and a mother), a person of self-reliance and decision of character, who would not have delegated her authority to servants or others, but have endeavoured to influence her youthful charge by the exercise of a firm moral control.

In consequence of these representations, the ladies received an assurance that the whole institution should be placed on a better footing, and they suspended accordingly the exercise of their functions until they should learn the result of the gentlemen's decision.

It is now, therefore, both with surprise and regret, that they learn that the same objectionable officials are to be retained, and that the gentlemen's intended reforms will be confined to a new list of rules and regulations, and some changes as to the relative authority of the existing Chaplain and Superintendent.

As the only objects which the ladies have in view are the safety and welfare of the three hundred orphans for whose maintenance the nation has so munificently provided, and as they feel that by the retention of the present Superintendent and Chaplain these objects will be sacrificed to what appears to them to be a very secondary consideration, namely, the unpleasantness of the task of dismissing incompetent officials,—

We, the undersigned, beg to state our conviction that, as members of a Ladies' Committee, we could not have been of any use to such an institution unless we had possessed sufficient moral courage to report our opinions honestly to the Executive Committee, even when we had reason to believe that some of its members did not agree with us in our notions of the kind of management suitable in a female asylum for education.

If we had abstained from the expression of our conscientious convictions, we should not only have been guilty of neglecting a sacred duty, but our functions would have been reduced to a mere farce.

Under these circumstances, feeling ourselves utterly powerless to accomplish any good, and hopeless of obtaining redress for any abuses we might hereafter detect in the establishment, we find ourselves under the necessity of declining any longer to sanction with our names a system of management of which we so entirely disapprove, and which cannot, in our opinion, either honestly and faithfully carry out the benevolent intentions of the founders of the Victoria Patriotic Asylum, or do justice to the munificent contributions of the nation towards the orphans of its Crimean heroes; and we have therefore to request the Executive Committee to have the goodness to erase our names from the list of the Ladies' Committee for the Victoria Patriotic Asylum at Wandsworth.

(Signed by) Lady Colchester.
Mrs. Adair.
Mrs. Cook.
Mrs. Prescott.

After discussion, the following was adopted by another portion of the Ladies' Committee:—

10th May 1862.

We fully concur in the sentiments expressed in the subjoined letter, and we only wish to defer our resignation until we see whether the Royal Commissioners, to whom we understand a reference will be made, adopt the view of your Committee.

The Report made to our Committee is so utterly at variance with our own feelings upon the various occurrences which have come to light, that under any circumstances we should feel some hesitation in continuing to act on the Committee.

We entirely dissent from the course followed by your Committee, as, under the present serious circumstances, we can hardly consider an original "want of previous experi-" ence" is sufficient cause for retaining the present officials, after nearly four years entire control on their part; and we further think that the persons intrusted with so serious a responsibility ought to be persons of experience and sound discretion.

We can only regret that the whole of these very painful and delicate circumstances had not been ascertained and rectified previous to the formation of the Ladies' Committee.

Signed by— The Hon. Miss Sugden.
Mrs. Brown.
Miss Coutts.

The remaining portion of the Committee adopted the following:—

10th May 1862.

As an appeal is going to be made to the Royal Commissioners, we, the undersigned ladies, wish to reserve our decision until the answer from those gentlemen has been sent to us.

Signed by— Lady Sarah Lindsay.
Mrs. Wellesley.
Mrs. Lefroy.

## Appendix VI.—*cont.*

### Additional Papers.

*Printed at the Request of the Committee of Ladies, at their Meeting of 26th June* 1862.

Letter from Chairman of Executive and Finance Committee.

Madam, 25th June 1862.

The Report of the Executive and Finance Committee having been laid before the Royal Commissioners on Friday last, the 20th instant, I beg to enclose, for the information of the Ladies' Committee, that portion of it which relates to the Royal Victoria Patriotic Asylum, and would request the particular attention of the ladies to the concluding paragraph thereof (No. 26).

After a lengthened discussion the Report was adopted by the Royal Commissioners, the accompanying Resolution having been put to the meeting and negatived.

I have also enclosed a copy of the new rules for the government of the Asylum, a copy of which will be furnished to each member of the Ladies' Committee as soon as they have been printed in a more convenient form.

I have, &c.
(Signed) Colchester,
Chairman of the Executive and Finance Committee.

To the Lady presiding at the meeting of the
Ladies' Committee of the Royal Victoria
Patriotic Asylum.

Copy of Resolution alluded to in foregoing Letter.

"That the facts which have been elicited show that "there have been faults in the management of the insti-"tution, which render it expedient that there should be a "change in the persons placed at the head of the Victoria "Asylum."

At a meeting of the Ladies' Committee, held at the Office of the Patriotic Fund, 19, New Street, Spring Gardens, on Thursday, 26th June 1862.

PRESENT:

Lady Sarah Lindsay (President).
The Hon. Mrs. Wellesley.
The Hon. Miss Sugden.
Mrs. Fishbourne.
Miss Coutts,
Mrs. Lefroy.
Mrs. Brown.

The minutes of the last meeting were read and signed,

Resolved unanimously:—

That the Ladies' Committee are of opinion that the printed Minutes, as furnished to them, do not contain the whole of their representations, some of which they consider of importance. They therefore now request that the omission may be supplied, and the Minutes, Nos. 7, 8, 9, 10, and 11, of the 1st April, and the last Minute of

10th May, may be printed, and that the names of the ladies as recorded in the minutes, and of the ladies who signed the several letters, may be furnished to the Royal Commissioners.

Read the following letter from the Chairman of the Executive and Finance Committee, dated 25th instant, with its enclosures:—

(*Vide* letter on page 12.)

The following Resolution was proposed by LADY SARAH LINDSAY, and after discussion it was deferred to the next meeting of the Ladies' Committee.

Subsequently the ladies whose names follow it, attached their signatures to record their approval, in the event of their being unable to attend at the next meeting.

"The Executive Committee, having minutely inquired "into the management of the Royal Victoria Patriotic "Asylum, and amended the regulations, and established a "more complete system of supervision, and having come "to the unanimous conclusion that there are not sufficient "grounds for calling upon the Lady Superintendent and "Chaplain to resign their offices, and the Royal Com- "missioners having confirmed that decision by a majority, "the undersigned place their services at the disposal of "the Executive Committee, in whatever manner may be "most conducive to the interest of the institution; at the "same time the undersigned submit for the consideration "of the Executive Committee, that by the selection of "ladies whose avocations and place of residence might "enable them more frequently to confer with the Super- "intendent upon the domestic concerns of the Asylum, a "more efficient supervision might be attained.

(Signed) "SARAH E. LINDSAY.
"CHARLOTTE ANNA LEFROY.
"ELLEN M. FISHBOURNE.
"M. WELLESLEY."

Resolved:—

That the Ladies' Committee postpone their answer to the communications of the Executive Committee until they have had more time to consider them; in the meantime they request that the first Resolution may be submitted to that Committee before the next meeting, on the second Tuesday in July.

At page 17 of the papers marked "Private and Confi- "dential for the information of the Royal Commissioners," Miss Coutts is the lady alluded to as having requested to see the punishment book.

Page 18 of the same papers, the eight ladies who signed the letter of the 27th March were:—

---

Page 21. The following is a continuation of the Meeting of the 1st April:—

| From Minutes of Ladies' Meeting, 1st April. | Remarks or Decision of Executive and Finance Committee, 12th April 1862. |
|---|---|
| 7.—Mrs. Adair stated to the Ladies' Committee that, on her visiting the Royal Victoria Patriotic Asylum last week with Mrs. Prescott, they were surprised on inquiring for Mary A. Lane, the pupil-teacher (whose desk had been stolen previously, and replaced during the ladies' meeting), to find that she was absent, having been allowed to go for a holiday; the ladies therefore beg to record their opinion of the impropriety of allowing a girl to leave the Asylum, pending an inquiry into anything with which she was connected. | |
| 8.—The Ladies' Committee beg to suggest, for the consideration of the gentlemen, the question of girls returning to the Asylum and mixing with other girls, after they have once been in service, such a course, in their opinion, being open to grave objection; and Miss Coutts stated that, in the case of one institution, she had tried it during the time she was connected with it, under circumstances likely to prove favourable, but it entirely failed of producing the good result she had anticipated. | The Committee will not permit any girl who has been engaged as a servant to return to the Asylum as an inmate without special leave obtained from the Committee at one of their monthly meetings. |
| 9.—The ladies further beg to suggest, for the consideration of the Executive Committee,—<br>(*a.*)—Whether or not the girls are retained in the Asylum to too great an age.<br>(*b.*)—Whether the children being allowed to go home to their mothers for the holidays is not calculated to prove injurious to the best interests of the children. | A return has been called for of all girls of 16 years of age and upwards, with a view of removing them from the Asylum.<br>Permission to go home must hereafter be subject, in each case, to the approbation of the Committee, according to the conduct of the mother and child. |
| 10.—The ladies desire to know the position of the medical man of the institution, whether his wishes and instructions are at all times attended to, and whether in the cases of two girls, who, they have heard, used to come to London to be mesmerised, such a course was sanctioned by him. | [Dr. Paul, (the medical officer), having been called in, stated, in reply to questions, that he visited the Institution every day, except Sundays, and then if necessary; that his wishes were at all times attended to; that he heard of girls being sent to London to be mesmerised—they were not sent by his sanction; was under the impression that the instructions for the girls to be mesmerised came from the Committee; that he had been assisted in every way by Captain Fishbourne and Miss Clavell; and that everything in his department was now working like clockwork.]<br>[Captain Fishbourne stated that, having found a girl lying faint on the grass, suffering in the same way as a boy who had been cured by mesmerism, he authorized her to be sent to London to be mesmerised, and he believed the nurse went with her.] It occurred in the latter part of 1859—the girl was sent to the Mesmeric Infirmary.<br>Resolution 3.—The Committee disapprove of any medical treatment of inmates of the Asylum, except under the direction or with the sanction of the medical officer of the establishment. |
| 11. The ladies also think it right to mention to the Executive Committee, that a lady told two of their body that, having tried two or three girls from the Asylum, she had been so disappointed at the manner in which they had conducted themselves, that she certainly would not, for the present, be induced to make trial of another. | |

MINUTES OF LADIES' MEETING, 10th MAY 1862.

The four signatures to the letter terminating on page 25 of the printed papers marked "private and confidential," were those of :—

LADY COLCHESTER. MRS. COOK.
MRS. ADAIR. MRS. PRESCOTT.

The three ladies who signed the statement on page 26, were :—

THE HON. MISS SUGDEN.
MRS. BROWN.
MISS COUTTS.

And the remaining portion of the Committee who signed the short statement beginning "As an appeal," were :—

LADY SARAH LINDSAY.
THE HON. MRS. WELLESLEY.
MRS. LEFROY.

Resolved unanimously :—

That a request be made to the Executive and Finance Committee for the whole of the Minutes of the ladies' meetings, and of the replies and observations of the Executive Committee thereon, to be printed; and that a copy may be furnished to each member of the Ladies' Committee.

At a meeting of the Ladies' Committee, at the Royal Victoria Patriotic Asylum, on Tuesday the 8th of July 1862,

PRESENT :—

MISS COUTTS (President).
THE HON. MISS SUGDEN.
MRS. FISHBOURNE.
MRS. BROWN.
MRS. LEFROY.

The Minutes of the last meeting were read and confirmed.

Mrs. Fishbourne stated that she had received a note from Major-General Lindsay, expressing the regret of Lady Sarah Lindsay at her inability to attend the meeting from indisposition, and signifying her desire that her name should be attached in the event of the resolution as originally proposed at the last meeting being again submitted for consideration, and which contained the words, "The Ladies' Committee having now learnt that upon "many points they have been misinformed," it was resolved by the following ladies that they do not desire the reinsertion of those words, as they are of opinion that there has been nothing adduced to show that the Ladies' Committee had incorrect information, as fully proved by the Report of the Executive and Finance Committee, and the new bye-laws, in which they are pleased to find that the Committee have taken cognizance of nearly every representation of the Ladies' Committee.

ANGELA G. BURDETT COUTTS.
CHARLOTTE SUGDEN.
CHARLOTTE ANNA LEFROY.
HANNAH BROWN.

Mrs. Fishbourne did not sign, as she considered it important to consult Lady Sarah Lindsay.

Resolved unanimously :—

The Ladies' Committee desire to call the attention of the Executive and Finance Committee to the second section of the 19th paragraph of their Report to the Royal Commissioners, in which they convey the impression that the ladies' opinion of the punishment having been unsuitable and severe was limited to corporal punishment, whereas the ladies never used the word "corporal," but expressed their opinion of the punishment in general.

---

The following letter was adopted by Miss Sugden, Mrs. Brown, and Miss Coutts :—

TO THE EXECUTIVE AND FINANCE COMMITTEE.

8th July 1862.

We, the undersigned ladies, in announcing our intention to join the four ladies who have already resigned, namely, Lady Colchester, Mrs. Adair, Mrs. Prescott, and Mrs. Cook, in withdrawing our names from the Visiting Committee of Ladies of the Royal Victoria Patriotic Asylum, beg as briefly as possible to refer to the circumstances under which the committee was appointed, and to the facts which have led us to the conclusion that the true interests of the children of the Institution would not be secured under the management of the present Superintendents of the Asylum, and that we cannot therefore continue to act with benefit to them or satisfaction to ourselves.

The Ladies' Committee was appointed by a resolution dated the 25th of January 1862, as we now learn by the Report just issued for the information of the Royal Commissioners, and, we have been informed, in consequence of the irregularities which had taken place in the Asylum, and which had to a limited extent come to the knowledge of the Executive and Finance Committee, through the frightful occurrence of the death by fire, in the early part of January 1862, of a young woman named C. J. Bennett, acting as servant in the Institution, and who was placed in solitary confinement for some offence—we believe, rudeness to the laundress.

At the second meeting held by the ladies at Wandsworth, the general mismanagement and want of proper discipline in the Asylum became very apparent from circumstances which then transpired. Amongst these may be mentioned—

First—The existence of petty thieving and pilfering, which were admitted to have prevailed for a length of time, and the following fact may be stated as affording proof that such habits existed, and that there had been apathy and negligence on the part of the authorities. While the Committee of Ladies was actually sitting and making inquiries on the subject of thefts, a desk, which had been stolen from a pupil-teacher's room some time six weeks before, was replaced in her room.

Secondly—The allowing young girls to go out alone on the common, and also to London and Woolwich. On one occasion two young girls—one of them to be mesmerised—were sent up to London by themselves.

Thirdly, the fact that corporal punishment had been inflicted on a girl nearly sixteen, by order of the Chaplain, acting under Captain Fishbourne, and carried out by the Lady Superintendent herself, on the refusal of the servants to obey the order.

These facts were brought under the notice of the Executive Committee, and subsequently eight of the ladies expressed their unwillingness to act with those to whom the Executive had intrusted the management of the institution.

To this communication the ladies received an answer on the 10th May, in which they were informed that the Executive Committee "disapprove and regret the conduct of the "Lady Superintendent and the Chaplain in some instances; "but considering the peculiar circumstances under which "the schools have been carried on in the absence of regular "inspection, excepting that of the senior honorary secre- "tary of the Royal Commission, the Committee are of "opinion that a recurrence of these faults may be prevented "by improved regulations and proper inspection, and that "therefore it is not necessary to proceed to the extreme "measure of now calling on the Lady Superintendent or "the Chaplain to resign their situations. In arriving at "this decision the committee show that they are not insen- "sible to the objectionable nature of the facts brought to "their notice by the Committee of Ladies; they also state "they feel bound to make allowances for the want of pre- "vious experience on the part of both the Lady Super- "intendent and Chaplain."

Upon the receipt of this reply, Lady Colchester, Mrs. Adair, Mrs. Prescott, and Mrs. Cook resigned, feeling with us that the disqualification of inexperience, and the absence of regular supervision, could scarcely be accepted as excuses after four years' trial, even supposing inexperience at the first were admissible in the management of children in matters which were not mere errors of judgment, but of common sense and feeling.

The six* remaining ladies of the Committee, of whom the three undersigned fully concurred in the sentiments of Lady Colchester's letter, decided not to act until the decision of the Royal Commissioners should be known, considering it probable that they would adopt the course usually followed in public institutions according to our experience, when there has been a failure in the management.

We rejoice to find, by the revised rules and bye laws, that the Executive Committee have admitted the force of the principal facts stated by the Ladies' Committee, and that they have seen the necessity of greatly altering the rules and regulations of the asylum; but we consider it is more than probable, however good these rules may be, that those who allowed such evils will relapse into their former habits of mismanagement and indifference, nor can we anticipate that those who for four years have acted together should now in such different relative positions carry out new regulations, with a due sense of their own responsibility, free from the influences to which they have so long submitted; moreover, we hold the opinion that no clergyman

---

* *Note by Executive Committee.*—This passage refers only to the ladies of the Committee then present; "the remaining ladies of the Committee" were, in fact, nine.

or lady can be fitted for so delicate and responsible a task as the education of children who are satisfied to give as a reason for their conduct that they acted under the authority of Captain Fishbourne, "to whom, as stated in "writing by the Chaplain, everything that happened or "was done, of the most trivial description, was made "known, as their only means of communication with "their rulers, and whose decision was considered by them "to be final, and his arrangements indisputable, whether "according to their views or not."

At a meeting of the ladies still remaining on the Committee, which took place on June 26th, we were informed that the majority of the Royal Commissioners present at their last meeting adopted the view of their executive, in retaining the Lady Superintendent and the Chaplain; we therefore consider that we have no alternative but to resign, as we feel that, anxious as we are for the welfare of the children for whom the nation has so generously provided, our co-operation cannot be useful whilst such a difference of opinion and feeling exists. But before our connexion with the asylum finally ceases, we venture to express our regret that we find in the new rules for the asylum no guarantee against the unsuitable and exciting religious meetings (partaking apparently of the character of revivals) which caused hysterical affections among the girls, and which, we have been informed, were permitted by the Chaplain, though we have no means of judging whether they were held with his own approval, or under the orders of the gentleman to whom alone he seems to have considered himself responsible.

(signed) Charlotte Sugden.
Hannah Brown.
Angela G. Burdett Coutts.

Since our letter of resignation was written we have received a copy of the omitted portions of our Minutes. We regret that the Royal Commissioners did not see them before they came to a decision on those parts before them, and we request that, for our justification in declining to act further with the present management, the printed sheets of the omitted Minutes and a printed copy of our letter of resignation may be sent to the Duke of Newcastle and to the Royal Commissioners, and we shall be glad to be informed when this has been done, as this is the last meeting we shall attend. We think it advisable to send a copy of this letter to the Duke of Newcastle, as Chairman of the Royal Commissioners.

(signed) Charlotte Sugden.

Hannah Brown.

When printed, we shall be glad to be furnished with copies of the proceedings of this last meeting, in order that the series of papers in our possession may be complete.

---

Royal Commission of the Patriotic Fund,
19, New Street, Spring Gardens, S.W.

Madam, 15th July 1862.

At the request of the Committee, I have the honour to enclose, for your information and that of Mrs. Brown and Miss Coutts, a copy of the Minute which has been this day unanimously adopted by the Executive and Finance Committee, in reply to the communication of the 8th instant, in which you and the two ladies above mentioned announced your retirement from the Ladies' Committee of the Royal Victoria Patriotic Asylum.

I have, &c.
(signed) Colchester,
Chairman of the Executive and
The Hon. Miss Sugden. Finance Committee.

---

(Copy) Colchester, Chairman.

Minute of 15th July 1862.

The Executive Committee have received with extreme regret the communication of Miss Sugden, Mrs. Brown, and Miss Coutts, dated 8th July, intimating their intention, in consequence of the decision of the Royal Commissioners with respect to the proposed dismissal of the Lady Superintendent and Chaplain, to retire from the Ladies' Committee.

The Committee well know the benevolent motives which have influenced the members of the Ladies' Committee in all their acts, and desire, as much as heretofore, to abstain from argument and controversy upon a subject which has given them so much pain; and upon which, in its whole bearing, the Royal Commissioners have now pronounced their judgment in confirmation of the unanimous report of the Committee.

The Committee, therefore, will not refer to the assumed reasons for the appointment of the Ladies' Committee, nor to other parts of the letter before them, which relate to points already decided, but will pass to the consideration of the allegations of a want of due supervision of the children in their absence on temporary leave or for medical treatment.

The three retiring ladies urge, in support of their views, "that young girls have been allowed to go out alone on the "common, and to London, and to Woolwich; and that on "one occasion two young girls, one of them to be mesme-"rised, had been sent to London by themselves." With respect to these statements, the ladies appear to have been misinformed. The Committee have inquired into the circumstances. They find that sometimes pupil teachers were sent out to shops, or the portress to the post office, but otherwise young girls were not sent out alone either upon the common or elsewhere; nor were they sent alone to London or to Woolwich, except in the cases of girls going home to their mothers, with the knowledge and by the desire of those mothers; nor were two girls sent to London by themselves for one to be mesmerised, except on some occasions when the nurse was occupied at home, and a steady servant girl was selected in her stead; otherwise when girls were sent to the mesmeric or other hospitals, they went under the care of a nurse. The visits to the Mesmeric Hospital were under circumstances which exonerated the Lady Superintendent and Chaplain, but the Committee disapproved of them, and they cannot occur again, unless directed by the medical officer.

It does not appear to the Committee that the reference made by these ladies to "the unsuitable and exciting "religious meetings" has much, if any, bearing upon the object of their letter, viz., to explain why they must retire because the Lady Superintendent and Chaplain were not dismissed.

The ladies admit that they "had no means of judging "whether the religious meetings were held with the Chap-"lain's approval," but they do not mention the Lady Superintendent, and the Committee are therefore bound to state that Miss Clavell disapproved of them, and expressed that disapprobation at the time.

The statement that the religious meetings referred to "caused hysterical affections," the Committee believe to be unfounded.

There have been cases of hysterical affection in the institution both before the religious meetings commenced and since they were discontinued, but the Committee cannot ascertain that any such affections can be traced to those meetings.

But the Committee have disapproved of those meetings; they have made the Chaplain directly responsible for all religious teaching; and they have made regulations which are entered in their own Minute Book, and which have been communicated to him, and by which he must abide.

In the letter of 10th May the retiring ladies say: "Feeling ourselves utterly powerless to accomplish any "good, and hopeless of obtaining redress for any abuses "we might hereafter detect in the establishment, we find "ourselves under the necessity of declining any longer to "sanction with our names a system of management of "which we so entirely disapprove."

In a resolution passed by the three ladies who have last retired, on the day on which the letter of resignation now before us was adopted, they refer to "the new byelaws in "which they are pleased to find that the Committee have "taken cognizance of nearly every representation of the "Ladies' Committee."

The Committee rejoice that the opinions entertained by these ladies on 10th May have been so far modified, but the Committee regret the more deeply that they have not thought it right to await the effects of the improvements which they admit, and have considered it their duty to persevere in demanding the expulsion of the principal officers, for reasons which seem now to be reduced to the opinion that "it is more than probable, however good the new rules "may be, that those who allowed such evils will relapse into "their former habits of mismanagement and indifference, "&c. &c."

# APPENDIX VII.

SENIOR SCHOOL.—The girls have been carefully instructed in elementary subjects, and their attainments are in general quite sufficient to enable them to do their duty in the situations which they are likely to occupy. They can keep accounts correctly, write an intelligible letter, and read with fluency and fair intelligence any book likely to be of use to them.

They have a good knowledge of the text of Holy Scripture, and their tone under examination is reverent, and indicates religious feeling.

The manners of the girls are pleasing; they are somewhat timid, excepting when examined by the Chaplain.

I do not consider that they are so neat and cleanly as might reasonably be expected. There is some improvement, but greater attention should be paid to this most important matter.

MIDDLE SCHOOL.—This school was conducted with ability by Miss Branen, lost ground under her successor, but with careful and able teaching it may be soon raised to a satisfactory condition, so far as regards all subjects of elementary instruction.

The children are intelligent, read with ease and fluency, write very fairly on paper from dictation, and have made fair progress in arithmetic. Their religious knowledge is good, and sufficiently extensive.

There is room for improvement in habits of personal neatness and cleanliness. I have called the attention of the Mistress and Lady Superintendent to this point.

INFANTS.—The children are getting on very fairly. The present Mistress is thoroughly conscientious, and pays due attention to elementary subjects.

The needlework is carefully inspected by the Superintendent in all these schools.

The Chaplain has evidently worked hard and successfully in all the schools.

The Pupil Teachers are not very efficient, and some of them may be displaced.

# APPENDIX

TO THE

# REPORT OF THE COMMISSION FOR IMPROVING THE SANITARY CONDITION OF BARRACKS AND HOSPITALS.

## INTERIM REPORTS ON BARRACKS AND HOSPITALS.

### I.—LONDON DISTRICT.

SIR,

IN compliance with instructions received from Lord Panmure, we have inspected the several barracks in the London district, and inquired into their sanitary condition, and we have now the honour of transmitting this *interim* report on the more important sanitary defects which have come under our observation.

The following is a list of the barracks we have examined within the London district :—

1. Wellington barracks.
2. St. George's „
3. Waterloo „ Tower.
4. St. John's Wood „
5. Portman Street „
6. Magazine, Hyde Park.
7. Knightsbridge Cavalry barracks.
8. Regent's Park „
9. Old Cavalry barrack, Kensington.
10. Old Infantry „ „
11. New Cavalry and Infantry, Kensington.
12. Windsor Cavalry barrack and hospital.
13. „ Infantry „ „
14. Hampton Court Old Cavalry barracks.
15. „ „ New „ „
16. Guards' barrack and hospital, Croydon.
17. Hounslow Cavalry barrack and hospital.

To enable us to estimate the comparative healthiness of the different Guards' barracks, we requested Dr. Balfour to prepare for us a statement of the sickness and mortality in those within the metropolis for seven years from 1847 to 1854, from which it appears that the mortality in the different barracks has ranged as follows :—

| | Deaths per 1,000 of Strength. |
|---|---|
| Tower | 17·81 |
| Portman | 15·17 |
| St. George's | 15·12 |
| St. John's Wood and detached barracks | 14·70 |
| Wellington | 13·33 |

This death rate is very much what might have been expected from the sanitary condition of the different barracks.

Perhaps a more important test of the sanitary condition of these barracks may be derived from the admissions into hospital from diseases usually connected with sanitary defects. The following table exhibits the admissions into hospital per 1,000 of strength from the more prominent zymotic diseases for the same seven years :—

| —— | Fever. | Diarrhœa. | Zymotics. |
|---|---|---|---|
| Tower | 71·08 | 104·96 | 176·04 |
| Portman | 53·19 | 53·40 | 106·59 |
| St. George's | 47·21 | 54·05 | 101·26 |
| Wellington | 44·78 | 49·88 | 94·66 |
| St. John's Wood and Detached Barracks. | 43·06 | 44·32 | 87·38 |

This table shows approximately the loss of efficiency from zymotic diseases, which are known to arise chiefly from impurities of the air, produced by overcrowding, defective ventilation, and nuisances.

Before proceeding to show to what extent these predisposing causes exist in the different barracks, we shall state briefly the general nature of the sanitary defects of the establishments in this district.

The barracks in the London district, exclusive of the new barracks at Kensington, not yet occupied, and the two small old barracks there which are about to be abandoned, furnish accommodation, according to the barrack-master's returns, for 4,232 men.

Some of the barracks, such as those of New Kensington, Tower, Wellington, and St. John's Wood, although of comparatively recent erection, do not exhibit those advances in healthy structural arrangements that might have been anticipated. Portman barrack, Knightsbridge barrack, and both the Old Infantry and Cavalry barracks at Kensington are much out of repair, and of bad construction.

The sites of some barracks, St. George's, Knightsbridge, and Portman Street especially, are more or less objectionable, on account of their being in the immediate vicinity of dense populations, or surrounded by lofty buildings which impede the circulation of air about them.

There is one defect common to all, even to the newest barracks, and that is, a very deficient amount of window space, and there are, moreover, important structural defects of other kinds. The large increase of window space in dwelling houses of modern construction in the last few years is very remarkable. But it has been met by no corresponding increase of window space, even in the most recently constructed barracks. A cheerful room means a light room, and in the lightest the inmates generally so place themselves as to obtain the greatest amount of light from the windows. In a room inhabited, as in a barrack, by 16, 18, or 20 persons, who cannot all sit close to the windows, the light should pervade the whole room as much as possible ; nor would this increase of light entail any expense, but the contrary, for in buildings of solid construction the window space is less costly than the masonry of the wall.

Generally, the staircases in the metropolitan barracks are much too narrow, and the ablution-rooms, bath-rooms and kitchens are defectively planned and constructed.

As an example of this, we may notice that in the New Kensington Cavalry barrack, the most recently constructed barrack in the London district, the kitchen and ablution-rooms, exposing a large wet surface, are placed on either side of the upper landing of one of the principal staircases, at the entrance to the corridor which communicates with every room in the barrack.

We may also point to a repetition in this barrack, of a very questionable arrangement—that of placing the rooms of the men over the stables. The arrange-

ment may be convenient, but as relates to health, it should always be avoided, if possible.

We shall afterwards give the details of accommodation in each barrack; but we may state here generally that, in six of the principal and largest barracks, we find the cubical space per man to range from 341 feet, the minimum (in St. John's Wood), to 690, the maximum (in Regent's Park).

The average in the Wellington barracks is 500; in St. George's, 520; in St. John's Wood, 341; in the Tower, 483; in Regent's Park, 690; in Knightsbridge, 458; about 380 in the Magazine barracks, Hyde Park; in Portman Street, 374.

We have reason to believe that even this moderate cubic space is liable to considerable reduction, according to the wants or distribution of different regiments.

Captain White, the barrack-master of the Wellington barracks, states in his return, that "the present "requirements of the head-quarters of a regiment "not being sufficiently provided for when barracks "are built, misappropriation takes place, and con- "fusion and discomfort ensue." "The orderly-rooms, "reading-rooms, tailors' and shoemakers' shops, "quarters for regimental staff serjeants, as marked "by authority, are so often insufficient for their "purposes as almost to force the misappropriation of "the soldiers' sleeping-rooms. This is the case at "present."

Captain White further states:—"The barrack- "master cannot alter the 'construction' sent to him "by the Inspector-General of Fortifications, or the "'occupation' sent to him by the commanding officer. "One deducted from the other is called available "accommodation, when in reality it is nothing of the "kind."

The largest amount of cubic space now allotted by regulation in infantry barracks is not sufficient to maintain health, and when the space is extended to 600 cubic feet as directed in our instructions, this space ought to be considered as no more subject to diminution than is the soldiers' diet.

It is true that no amount of space can give security to health in a polluted, stagnant atmosphere. It is, however, the only means of rendering such an atmosphere less dangerous, and no class of barracks requires it so abundantly as those in towns. Stillness of atmosphere, produced by high walls, multiplicity of buildings, small courts, culs-de-sac, and other obstructions to free perflation, as well as atmospheric impurities arising from the greater accumulation of decomposing matter, necessarily consequent on increasing the population on a given surface, can only be compensated by the most liberal allowance of cubic space, and the best sanitary arrangements of every kind possible under the circumstances.

We think, therefore, that commanding officers should be instructed that no misappropriation of sleeping-rooms can be sanctioned for any reason whatever.

We have found a very general adoption of the common methods of ventilating, either by ventilators in or near the ceiling of rooms, in the centre of floors, or in the skirting. In some rooms Dr. Arnott's ventilator in the flue of the chimney is added. But in no one instance is there any satisfactory method in use for supplying a sufficiency of pure air, and at the same time preventing draughts.

In most of the attempts to ventilate the London barracks, the principle has been followed of admitting fresh air at or near the level of the floor, and providing more or less effectually for the escape of heated air above; but the position of the inlets is objectionable from their introducing cold air among the men's feet, while no provision has been made for breaking up the current or for diffusing the air. As a consequence the ventilation is universally imperfect by the lower ventilators being interfered with by the men, and not unnaturally so when the orifice is barely six inches from the bed on which the soldier is lying, and the stream of fresh air, which is to supply 18 or 20 men, blows directly on one.

It appears to us that the walls and ceilings of the barrack-rooms are not cleaned often enough for health, and we therefore recommend that quick-lime washing should be used at least twice a year in all barracks.*

In addition to the evils of defective ventilation, the air in barrack-rooms is further deteriorated by the use of gas-light, without any means of carrying away the effluvia from the burners.

The latrines in the London district admit of being flushed into main sewers. They are not always well constructed; they are dark, damp, and noisome.

The evils are in some instances aggravated by the urinals being placed in the same confined buildings with the latrines, and being unsupplied with water for purification.

The privies at the Wellington barracks are placed in the centre of the inner yards, with urinals in the same building. The building covering them is badly ventilated and lighted, and any effluvia from the latrines and ash-pit must necessarily diffuse themselves through the still atmosphere of the court, already too confined from the nature of the buildings.

In common with all others, except that at St. John's Wood, the latrines at Wellington barracks are open to the objection of having the soil receptacle too broad and too deep, and in consequence there is an unnecessarily large surface left for noisome exhalations. The sides too, which the water cannot reach, become rough and filthy, not admitting of being kept clean. Their internal arrangements have been planned without sufficient regard to decency, there being no divisions between the seats. In the new barracks which we have seen at Portsmouth and Aldershot, this latter evil has been avoided.

The sources of impurity in a barrack are so numerous, the facilities for their accumulation often so much greater than those for their removal, that all filth or refuse ought to be immediately removed, and ash-pits and other similar receptacles upon the scale now used, and near the buildings, should be abolished.

In the case of barracks situated in towns, the ash-pit, if moved away from the barrack-rooms, is probably brought into close proximity with some other buildings, the inhabitants of which are as injuriously affected as were the troops, and the ash-pit is objected to accordingly.

The great evil of these ash-pits is, that they permit and in fact provide for, the accumulation of decomposing refuse close to barrack-rooms. They are generally capacious, and expose a large surface; they are not judiciously placed in relation to the barrack-rooms, and they are universally uncovered.

The last circumstance may be taken as proof of the little suspicion attaching to these places of deposit, though in reality they are dangerous to health, especially in the vicinity of crowded buildings.

The utmost vigilance cannot prevent vegetable and other decomposing matters, as well as ashes and dust, being thrown into them, as also slops of all kinds. These, aided by alternate rain and sun, are known to generate emanations injurious to health.

The only safe principle on which to dispose of the refuse of barracks, is to remove it at once and completely; the present practice is to remove part, and that, of course, the upper part, at the convenience of the contractor, which results in the most dangerous portion, namely, the lowest and the oldest stratum being left in the ash-pit.

Daily removal of the whole ought to be insisted on. We therefore recommend that each large barrack

* See Warrant and Barrack Regulations, Instructions relating to Buildings, Art. 186, and App. No. 16, Arts. 4 and 9.

should be provided with two iron carts, each capable of containing the daily refuse, one of which should remain at the barrack as a receptacle for the refuse, to be taken away and emptied every morning, when it would be replaced by the empty one.

In the barracks of the London district the construction and position of the lavatories are not what they ought to be for health.

These washing-places are a modern concession to cleanliness. The older barracks were not originally provided with any room for the purpose, out-door ablution at the pump being then the practice.

The coldest, gloomiest, and least eligible part of the building is generally allotted to them, namely, the basement. They are, in consequence, distant from the majority of the sleeping-rooms, and must be reached through cold and gusty passages. To be thus suddenly transferred from a hot and close barrack room to a cold, gloomy cellar, saturated with moisture, would require constitutions of iron : it is an unnecessary risk to health, and a wear and tear not in any way required by the service.

The evil does not stop here. The free use of cold water, the best protection against the effects of early morning exposure to weather, is apt to be only partially resorted to, or probably altogether dispensed with, at the proper hour by the men whose constitutions are most sensitive to the effects of damp air and rapid changes of temperature.

The arrangements for bathing are equally defective. At the Wellington barracks, where there are five baths for 1,500 men, we are informed that a large number of men may sometimes be seen waiting for their turn. Encouragement should be given to any disposition to cleanliness, as not only the comfort and health of each individual is thereby promoted, but greater purity is ensured in the atmosphere of barrack-rooms, the state of which is greatly affected by the want of personal cleanliness of individuals sleeping in them. When sufficient accommodation for bathing shall have been provided, we venture to suggest that it would be desirable that means should be taken, subject to medical control, to ensure that every soldier should wash his whole person once a week.

We have found libraries provided in most of the barracks. In all such instances they are objects of care and attention. But, in several instances, the ventilation and lighting of these libraries are exceedingly defective.

In the Wellington, St. George's, and Tower barrack, good-sized school-rooms and convenient fittings have been provided on a plan supplied by the chaplain-general.

The infant schools are not so well accommodated ; the rooms are generally small in proportion to the number of scholars. In several instances the ventilation of the day and infant schools is very defective, and the air is, in consequence, close and impure.

Except at the Portman and St. John's Wood barrack, in which the want has been accidentally supplied by a disused riding school, there is not a day-room in any of the London barracks.

Such a room, we consider, is required in every large barrack as a place of recreation, and perhaps it might be used as a refectory. It would obviate the necessity of making-up the beds before they have been aired and even before they are cool, in order to enable the men to breakfast, and would thus conduce to the purity of the barrack-rooms and the health of the men.

We have found accommodation set apart for married soldiers within several of the barracks. But the sanitary condition of the rooms is not sufficiently attended to.

The rooms specially designed for married non-commissioned officers are often much too small for families. They are generally placed in confined and badly ventilated parts of the barracks.

At Knightsbridge the married privates, as also the non-commissioned officers, are accommodated in the entresol of the building—often in large barrack-rooms, divided by curtains, some of the divisions having no access whatever to the external air. The atmosphere of these rooms is very close and foul. In the same part of the building are also the kitchens, laundries, shops, and several other offices. The atmosphere is in consequence unwholesome, and likely to communicate its impurities to the rooms above.

One or two of the non-commissioned officers' rooms at Portman Street, from darkness, damp, and want of ventilation, are absolutely unfit for human habitation. Those in the Wellington barracks are also bad. They are reached by a long narrow staircase; they are very small, badly ventilated, and, from being over the kitchen, they are close and unwholesome, the thermometer standing in them, in summer, sometimes at 80° F.

In Knightsbridge barracks the sanitary condition of the staff officers' quarters is little if at all better than that of the serjeants and privates. They are placed in a confined corner of the barrack-yard, over the infirmary stables and sick horse-boxes, the effluvia from which at times pervades them.

The laundries in all the barracks we have inspected in London are mere wash-houses. The apparatus in the Wellington barracks is the best in any of the metropolitan barracks, and, indeed, is very good, but the soldier is not allowed to use it. It is reserved for the use of the barrack department. The appliances for properly getting up linen are wanting in all ; none are provided with drying apparatus, a deficiency which without doubt frequently exposes the soldier to the risk of wearing damp linen.

We have since seen a very complete laundry and married soldiers' establishment at the Anglesea barracks, Portsea, with drying apparatus, wringing machine, and other conveniences.

In all the barracks the kitchen arrangements have been very imperfectly considered. The want of space and light, which is in kitchens synonymous with filth and neglect, the paucity of appliances for any but the roughest cooking, show that the meals of the soldier can be but mere sustenance, if, in their vapid sameness and moderate quantity, they are even that. Gas roasting-ovens have been erected in two or three of the kitchens.

Steam, smoke, blackness, filth, and disorder are the normal conditions of these places in some of the barracks we have visited.

There is no difficulty in erecting suitable apparatus for cooking so far varied as to include baking and roasting, as well as boiling, which would work well and cleanly in place of those sombre, clumsy constructions which seem to offer a premium for neglect and bad cooking.

All the barracks in the London district, except the Tower, are abundantly supplied with good water, either from the Government artesian well, or from the West Middlesex and other water companies.

The Tower is partly supplied by the Mint well, from which it receives 2,000 gallons per day, partly by Thames water, which is unfit for drinking.

We would advert here to an arrangement in the water supply of the Tower hospital, which has been remedied since our inspection, so far at least as the kitchen is concerned. In a small court behind the hospital were placed close together two water taps, one supplying foul Thames water, drawn opposite the Tower, though filtered; the other supplying water from the Mint artesian well. The former is absolutely unfit for use, and yet by a very easy mistake it might have been drawn for the use of the sick. Again, the only water tap in the hospital kitchen is supplied with the same Thames water, and there is no security that it may not be drawn for

cooking for the sick. This singular arrangement is the more unaccountable as the barrack kitchens are supplied solely by the artesian well water.

The large and widely-spread heaps of stable manure in the cavalry barracks are nuisances dangerous to health. We are of opinion that these accumulations should be daily removed from the cavalry barracks of the metropolis.

Having described generally the sanitary condition of these barracks, we now proceed to notice, shortly, the defects of individual barracks, and to point out the means for their removal.

## 1.—WELLINGTON BARRACKS.

These barracks stand in an enclosure occupying altogether 7a. 3r. 3p. in extent, and are constructed to contain, under the existing regulations, 1,530 non-commissioned officers and men ; the space per man varying from 435 to 564 cubic feet.

They consist of four blocks, A. B. C. and D., built at different periods, forming an irregular quadrangle, with interior yards, the ends of which form culs-de-sac. The external ventilation of these parts of the barrack is very defective. The privies, urinals, and ash-pits are placed in the centre of each court, so as to add to the impurity of the already stagnant air.

The principal building, named block "A.," is three stories high. The barrack-rooms in it are placed back to back, four rooms on each floor. The fire-places are in the middle of the wall, between each set of two rooms, and the windows, three in number in each room, are opposite the fire-place. Some of the rooms have large square openings, protected by sliding shutters, for the purpose of ventilation through the centre wall into the adjacent rooms ; the men complain of the discomfort occasioned by the noise through these openings. They are of no use for ventilation, and except when the windows are open, they merely allow of the interchange of the foul air between the two rooms.

In this block each room is provided with openings for ventilation in the ceiling, having valves, capable of being closed. There are also openings by means of air bricks near the level of the floor, which, however, are almost always stopped by the men, on account of draughts. And none of the ventilating openings are provided with means for breaking the current or diffusing the air.

The chimney breast is three feet or three feet six inches from the ground.

In "B." block, all the rooms have two windows at one end ; and two at the other, of smaller dimensions, opening into a closed corridor 9 feet broad. Each room has four ventilators, 10 inches square, near the floor, and four in the walls near the ceilings, communicating with flues running to the top of the building.

In "C." building, all the rooms are arranged similarly to those in "B." The rooms and corridors are ventilated by gratings in a hollow skirting, and air flues near the ceiling, carried into flues in the roof, terminating in a shaft at the top of the building, where ventilation is assisted, in hot weather, by gas burners. Air-bricks are provided between the rooms and the corridor, and the corridor is fitted with stoves and hot-water pipes, to enable the air in it to be warmed, the object being that warm air should pass into the rooms, and thence to the central shaft. These stoves and pipes have not been used.

In "D." building, the rooms extend from the back to the front, with two windows in each end. They have also ventilators similar to those in "B." building.

The following table shows the number of men accommodated in the rooms according to the existing barrack regulations, as contrasted with the number they will accommodate under the required space of 600 cubic feet per man :—

| Buildings. | Number of Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |

| „ | 1 | 20 | 17 | 3 | 20 | 17 |
| „ | 8 | 112 | 88 | 24 | 14 | 11 |
| „ | 1 | 13 | 11 | 2 | 13 | 11 |
| „ | 1 | 20 | 17 | 3 | 20 | 17 |
| D. | 1 | 21 | 17 | 4 | 21 | 17 |
| „ | 2 | 40 | 34 | 6 | 20 | 17 |
| „ | 2 | 36 | 30 | 6 | 18 | 15 |
| „ | 1 | 14 | 12 | 2 | 14 | 12 |
| — | 89 | 1,354 | 1,134 | 220 | — | — |

This table shows that while the existing regulation makes provision for 1,354 men, the barrack-rooms will only, at 600 cubic feet per man, accommodate 1,134 men, and hence that additional accommodation is required for 220 men ; showing an actual deficiency of 16 per cent. of accommodation.

The regulation accommodation, however, does not give a correct idea of the number of men in barracks; for the actual number of men in the occupied barrack-rooms is 1,447, which exceeds the regulation number by 93. To effect this an additional number of men is placed in 56 out of 89 rooms.

In 22 rooms there is one man in each above the regulation number.

In 36 rooms there are two men above the regulation number in each room.

In two rooms there is one man in each below the regulation number.

In two rooms there are two men below the regulation number.

The barrack-rooms, as we have shown, will only hold 1,134 men, if each man has the minimum space requisite for health, namely, 600 cubic feet ; and there are thus 1,447 men in the cubic space necessary for 1,134 men, and hence 313 men should be removed out of the barracks and accommodated elsewhere.

There are 12 soldiers' sleeping-rooms capable of containing, perhaps, 110 men in all, misappropriated, as follows :—

Two are used as orderly-rooms, one as a library, and nine rooms are occupied by regimental staff-serjeants, &c. No other available accommodation exists for any of these purposes.

The misappropriations should either be deducted permanently from the barrack space, or else they should be restored, and space for the library, orderlies' and staff-serjeants' rooms provided elsewhere. But, even if this latter course were taken, there would still be a deficit of sleeping space for 200 men. There is misappropriation of barrack-rooms also as tailors' and shoemakers' shops.

There is nominal accommodation for 20 serjeants per battalion, but many of the rooms, 11 feet by 9, are too small for a family. They are close and unwholesome, approached by a narrow staircase, and over the kitchen, the heat and smell from which is so great as to be intolerable in warm weather. Even in winter the thermometer in the rooms frequently stands at 70°. The families of married soldiers live out of barracks.

Gas is used for lighting throughout the building, but without ventilators.

There is no separate day-room.

School-rooms have been built expressly for adults and infants, but they are not sufficiently large.

There is a school-room for the men, in which the gas-lights are inconveniently placed. It has two fire-places, but fuel for one fire only is allowed.

There is a library and reading-room, to which those who subscribe are admitted, the books being furnished by the Government; but the space is obtained by misappropriation of a soldiers' barrack-room.

The ablution-rooms are placed on the basement story. In one of them two baths only are provided, although the room in which they are placed could conveniently hold 10; it is stated that 100 baths per day are taken. There are in the whole building five baths, two heated by steam, and three by hot water, supplied from an adjacent laundry. Two rooms are appropriated as soldiers' laundries; but there are no drying-rooms. The wives of non-commissioned officers only being allowed to live in the barracks, part of the soldiers' washing is consequently done outside.

There are four cook-houses, fitted with ordinary ovens, two for each battalion.

The cook-houses stand in rear of the barracks. They are narrow and lofty, and contain a row of coppers, arranged against the wall, and an oven for baking. The space is confined, and they are not light enough. In the same building are placed the non-commissioned officers' quarters, so much complained of.

There are six cleaning-rooms, all in the roofs of the buildings. When they are in use, the air of these rooms is charged with a cloud of fine pipe-clay dust, which is breathed by the men, and is very likely to be injurious to health. Any one who has had an opportunity of witnessing this method of cleaning the white undress jackets of the men cannot fail to be struck with its injurious tendency, and with the expediency of providing undress jackets of some other colour.

Between the buildings there are two covered ways, used for drill.

The tailors' and shoemakers' shops are situated in the basement, but are so dark as to lead to the misappropriation of the soldiers' sleeping-rooms for workshops.

The water supply is of excellent quality, abundant and uninterrupted, from the Government artesian well.

The present system of drainage was laid down in 1851, and consists of glazed pipes properly trapped, which discharge themselves into the main sewer in York street.

In the confined court-yards behind the barracks, surrounded by the non-commissioned officers' quarters and the barrack-rooms, stand the ash-pits, privies, and urinals. The ash-pits are large, uncovered, and generally full of refuse. The privies and urinals are under one roof; the privies are dark and offensive; the back wall from the seats to the water is in a continually filthy state; they have no divisions, and the seat is what is customary in old barracks, consisting simply of cross bars at intervals, as if a ladder had been laid over the trough.

The guard-room is too small and confined for nine men, and the cells, the privy, and the urinal attached, are all almost under the same roof with it.

It is necessary to advert here to the practice of using large quantities of sand in cleansing these barracks. As much as four tons a week have been so used in the Wellington barracks. It fills the staircases and barrack-rooms with fine sand dust, which is inhaled by the men, and is deposited over the whole building. The inhalation of sand dust is a predisposing cause of chest diseases; and without attributing to it unnecessary importance, we are of opinion that sand should cease to be used for cleansing, as has been the case in the barracks of the line.

*The following requirements are necessary for securing the healthy condition of Wellington Barracks:—*

1. Misappropriated rooms to be restored to their use as barrack-rooms, and suitable buildings erected for library, offices, day-rooms, workshops, &c.; or otherwise the misappropriations to be confirmed, and the space deducted from the "available accommodation."

2. Numbers in every room to be reduced, so as to increase the cubical space to 600 feet per man.

3. Every barrack-room in which there are no air shafts to be ventilated by an air shaft, carried up from the ceiling of the room, above the roof of the barrack, and fresh air to be admitted to every barrack-room by inlets and perforated zinc cornices at the top of the room. This method of admission to be substituted for orifices in or near the skirting boards in all the rooms. These latter orifices to be permanently closed.

4. Special accommodation to be provided for library and for day-rooms.

5. Windows in lavatories to be enlarged, and the number of baths to be increased as far as the space will allow.

6. Wash-houses to be provided with drying apparatus.

7. Married non-commissioned officers' quarters to be ventilated by inlets, and means to be adopted for thoroughly ventilating the kitchens under these quarters.

8. Reconstruction of privies and urinals throughout, with proper divisions and doors, and increased light by means of glass tiles in the roof.

9. Daily removal of barrack refuse to be provided for.

10. Kitchens to be provided with roasting ovens for varying the cooking of rations, and with means for supplying boiling water for tea.

11. The use of sand for cleaning to be discontinued.

## 2.—ST. GEORGE'S BARRACK.

These barracks are surrounded on all sides by lofty buildings, which prevent that free circulation of the air, so necessary for health, when large bodies of men are congregated together.

They are situated behind the National Gallery. They occupy with the barrack-yard an area of 1a. 2r. 3p., and are constructed to contain 540 non-commissioned officers and men. The front faces the east, and is from 200 to 250 feet from the nearest buildings; the back is not much more than 20 feet from the houses in rear, and the interval is partly occupied by offices.

The barracks are three stories high; the rooms run from front to back, and have windows on both sides,—an arrangement which affords the best barrack-room ventilation, so far as it can be obtained by open windows alone. Two rooms open upon the central landing and staircase on each floor; the fire-places are in the centre of the side opposite the door.

The cubic space per men ranges from 506 to 531 feet. The rooms used as barrack-rooms are 31 in number, and contain from 14 to 16 men each.

Twenty serjeants' rooms have been constructed on the landings of the staircases at the back, but are far too small, being only 11 feet by 9. There is no accommodation for married soldiers.

The barrack-rooms have almost all been provided with a ventilating shaft, carried up in the chimney stack.

There are also, in most rooms, ventilators in the ceiling, connected with openings in the wall outside; these can be closed by valves, which, being under the control of the men, are generally shut at night.

There is no day-room.

The barrack is lit by gas.

As St. George's barrack contains none of the re-

quirements for the head-quarters of a regiment, or for schools, there is considerable misappropriation of rooms for such purposes.

One barrack-room is taken for a school-room, for which it is much too small. Another barrack-room has been taken for a library, and others are occupied by non-commissioned officers.

There is one ablution-room in the basement, and another in the rear of the buildings, with one bath. The ablution-rooms are well supplied with water, but are dark and damp, and are without wooden gratings for the men to stand on. The women's wash-house is dark and ill-ventilated.

There are two kitchens in the basement, one fitted with a gas apparatus for roasting, and one with boilers only. The roasting apparatus does not appear to give satisfaction.

The laundry is in rear of the barracks, in a room which measures 20 × 15 × 16 feet high.

There is one cleaning-room in the basement, from which the pipe-clay dust makes its way to the top of the building, entering the windows as it ascends—a sufficient proof of the extent to which the use of pipe-clay for cleaning may injure the purity of the atmosphere.

There is no covered shed for drill.

There is no tailor's shop. A room in the rear is marked for a shoemaker's shop, but not used, on account of being too dark.

The water supply is excellent and abundant, and is derived from the Government artesian wells.

The guard-room is of a good size; but it is dark and wants ventilation.

The privies and urinals are in rear, close under the windows. The ash-pit is also in rear; it is large and uncovered.

There is by no means sufficient space for circulation of air between the privies, urinal, ash-pit, and the barracks.

The sewerage is sufficient, and does not pass under the buildings. The drains are trapped.

The latrines are flushed out into the sewers and afterwards filled with water every morning, and oftener, if required. But they have no divisions or doors.

The urinals are without water and offensive.

The following is the accommodation in occupied rooms in St. George's barracks :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 21 | 336 | 294 | 42 | 16 | 14 |
| 10 | 140 | 120 | 20 | 14 | 12 |
| 31 | 476 | 414 | 62 | — | — |

The number of men on the schedule of St. George's barrack is 540.

There are seven sleeping-rooms turned to other uses.

The number of men which ought to be placed, according to the existing regulations, in the occupied rooms is 476.

The actual number in these rooms, 517.

The number of men which the occupied sleeping-rooms ought to contain, at 600 cubic feet per bed, is 414.

The probable number the barrack could contain at 600 cubic feet, if all the sleeping-rooms were occupied, is 450, leaving a deficiency of accommodation in the occupied rooms for 62 men.

It hence follows—

Either that the misappropriated rooms should be permanently deducted from the schedule, and the number of men on the schedule reduced from 540 to 414.

Or, that the misappropriated rooms should be given up for sleeping-rooms, and the number in the schedule reduced from 540 to 450.

In either case 600 cubic feet of space should be given to every bed.

Captain White remarks, that all the requirements for the head-quarters of a regiment are deficient in this barrack, and all have consequently been taken from the sleeping accommodation intended for the men.

*The following are the Sanitary Improvements required for St. George's Barracks:—*

1. The estimated "available accommodation" to be reduced, so as to give the space required at the rate of 600 cubic feet per man. Mal-appropriations to be discontinued, and additional buildings to be provided for school-rooms, day-rooms, tailor's shop, &c., in which this barrack is at present deficient.
2. Better accommodation for non-commissioned officers to be provided.
3. Ventilation of rooms to be improved by perforated zinc inlets in the cornices of the rooms.
4. The laundry to be better lighted and ventilated, and to be provided with suitable means for drying linen.
5. Kitchens to be provided with roasting ovens.
6. Seats of latrines to be properly divided: to have doors, and to be better lighted by glass tiles in the roof. Urinals to be supplied with water.
7. Improvement of ablution-rooms by additional light, the use of wooden gratings to stand on, and an increased supply of baths.
8. Ashes and dust to be removed daily.
9. A covered shed for drill to be provided.
10. Guard-room to be better lighted, and to be ventilated through the roof.
11. Use of sand for cleaning floors to be discontinued.

## 3.—WATERLOO BARRACKS, TOWER.

These barracks stand within the precincts of the Tower; they were built after the fire; they are calculated to contain 766 non-commissioned officers and men under the existing regulation, with a cubic space per man varying from 432 to 535 feet.

The accommodation is allotted as follows :—

| Number of Rooms. | Present Regulation Number of Men. | Number of Men at 600 Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 2 | 34 | 30 | 4 | 17 | 15 |
| 11 | 198 | 165 | 33 | 18 | 15 |
| 2 | 34 | 30 | 4 | 17 | 15 |
| 12 | 216 | 180 | 36 | 18 | 15 |
| 2 | 34 | 26 | 8 | 17 | 13 |
| 12 | 216 | 156 | 60 | 18 | 13 |
| 41 | 732 | 587 | 145 | — | — |

The rooms now occupied as sleeping-rooms will only accommodate with safety 587 men, instead of 732, their present number.

It is necessary, therefore, to reduce the number on the schedule to 587, and to apportion the accommodation at the rate of 600 cubic feet per man, which will necessitate either the removal of 145 men from the barracks, or providing additional barrack-room for that number at the same ratio of cubic space.

The barrack-rooms are lofty, but they exhibit an obvious error in construction in being built back to back, and being ventilated into each other by openings in the partition walls. In the lower, and indeed in all the rooms, the bottom of the windows is above the level of the eye, which makes the rooms far from cheerful. Some rooms are very dark. The fire-

places are on the sides, opposite the doors. Ventilators are provided for each room at two feet above the floor, close upon the men's beds, and as a necessary consequence they are closed up at night, when fresh air is most required. With a few exceptions there are 18 men in each room, and there is no misappropriation of rooms. The ventilation of these barrack-rooms is most imperfect.

The non-commissioned officers have 34 sleeping-rooms, which are small and inconvenient, being placed in the projecting ornamental towers.

There is no special accommodation for the wives and families of non-commissioned officers and soldiers.

The serjeant's mess-room is very dark and ill-ventilated; there is a blank window in the architecture, not now pierced, which might be rendered available for increasing the light.

The school-room at the time of our inspection was badly ventilated. It is small for the number of men. The ventilation has, however, been since improved by a trifling alteration.

The soldiers' library is above the cook-house, and consequently very hot and close in summer. The whole building is lit by gas, but without ventilators over the burners. There is no day room.

The guards' ablution-rooms are good; there are two baths. Additional baths are required.

The artillery ablution-room is dark, and badly ventilated, and has no bath.

There is one laundry, supplied with water inside.

The cook-houses are all provided with coppers, but not all with ovens. They require ventilation.

The privies and urinals are in a circular and very spacious room; the privies are of the usual form, without divisions, and the urinals are very offensive; but the drainage is sufficient, and does not pass under the buildings; the drains are trapped, and the latrines are flushed daily.

There is only one privy for all the women attached to the troops in the Tower.

There are two cleaning-rooms under the roof of the barracks.

There is no shed for drill.

There is a tailor's and a shoemaker's shop.

The guard room is not well ventilated; and the ventilation of the lock-up room is most defective.

The *hospital* belonging to these barracks has been formed out of dwelling-houses, which have been adapted for the purpose. The wards consist of rooms, thrown together; they are small, low, confined, and insufficiently ventilated. The kitchen, in the basement, is badly ventilated. The urinals at the back are offensive, as no water is turned through them.

The Tower barracks and hospital are supplied with water from two sources:—

1st. From the well at the Mint, which gives 2,000 gallons daily.

2nd. From the Thames.

The water from the Thames is unfiltered, but is pumped into large tanks, where it can settle when not drawn off too rapidly.

We thought it right to submit the water from these two sources to Mr. Witt for analysis.

The water from the Mint is not very good, but the Thames water is entirely unfit for use, especially in warm weather, when it rapidly begins to emit a smell from the decomposition of organic matter.

The latter water at the time of our inspection was the only water supplied to the hospital kitchen, but this defect has been since remedied.

Quarters for schoolmaster and schoolmistress are wanting, also an infant school-room.

*The following are the Requirements for Health:—*

1. All the barrack-rooms to be ventilated by shafts, with inlets for fresh air near the ceiling. Present inlets to be closed.

2. Artillery ablution-room to be better lighted, and to be provided with wooden gratings and a bath.

3. Guards' bath accommodation to be increased.

4. Laundry to be provided with drying closet.

5. Non-commissioned officers' quarters to be ventilated.

6. Increased supply of water from the Mint, or from some water company, and the use of Thames water to be discontinued.

7. Quarters for schoolmaster and schoolmistress to be provided.

8. Better ventilation for kitchen, and additional ventilation for school-room and library through the roof.

9. Ashes and refuse to be removed daily.

10. Numbers of men in barracks to be reduced so as to allow 600 cubic feet per man.

11. Windows of barrack-rooms to be lowered by addition of another tier of mullions, and an additional window to be pierced in the officers' mess-room.

12. Wards of *hospital* to be ventilated by shafts through the ceiling, and proper inlets for air close to the ceiling of the room. It would be very desirable that a better hospital should be provided.

13. Sand for cleaning floors to be discontinued.

14. Guard-room and lock-up to be ventilated by suitable openings near the ceiling.

15. Day-room to be provided.

16. Privies to be ventilated and divisions and doors to be provided. Urinals to be ventilated and supplied with water.

## 4.—ST. JOHN'S WOOD BARRACKS.

These barracks stand in a comparatively open position in Ordnance Road, St. John's Wood, and are within an enclosure of 4A. 2R. 19P. in area.

They are placed along the southern end of the inclosure, and a riding school and quarters for two officers occupy a portion of its northern end.

The barracks were originally intended for cavalry, but no stables were ever built, and the riding school, which is the finest and largest in London, remains as the only record of their original destination.

The barrack is two stories high. It consists of five separate blocks, three appropriated to the men, and two, at the ends, to non-commissioned officers, and to the kitchen. Two rooms open out of each landing or staircase; the fire-place is opposite the door, and the windows open into the barrack-yard. As the barracks are placed close to the boundary wall, no openings can, as we are informed, be made through the walls at the rear of the barrack-rooms, and they cannot, therefore, have any thorough draught for effective ventilation. The dead wall referred to runs along the whole of one side of the range of buildings. The windows face the north on one side only, and the rooms exhibit sanitary defects incident to back-to-back cottages, from the atmosphere in them being always more or less stagnant.

The following table shows the accommodation, in contrast with what it would be at 600 cubic feet per man:—

| Number of Barrack Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 11 | 220 | 121 | 99 | 20 | 11 |

The barrack was unoccupied when inspected by us.

There is no misappropriation of barrack-rooms. All the rooms are allotted according to the schedule.

Ventilation is partially provided for by openings seven inches square, placed in each barrack-room, communicating with air bricks in the external walls. But the condition of the atmosphere, even when the

rooms were empty, showed that the ventilation is very defective.

In the serjeants' rooms there is no provision for ventilation. The guard-room is not ventilated.

The building is lighted by gas, without any provision for removing the products of combustion.

There is a library. The school-room and an exercise or day-room for the men are placed in a space partitioned off from the riding-school.

The lavatory, which is in a detached building, is supplied with water from a slate cistern.

There is a bath supplied with a boiler, and a washhouse, fitted with two coppers. But there are no means of drying linen in moist weather.

There is no accommodation for married privates.

The kitchen is supplied with Deane and Dray's gas-stove for baking, and six ordinary boilers. The kitchen is too close to the latrines, and suffers much from the effluvia arising from them.

The cleaning-room is a lean-to building, in continuation of the washhouse. The riding-school is used for drill in wet weather. There is an armourer's shop, but no other means of affording employment to the men.

The water supply is derived from the West Middlesex Water Company.

All the drains are trapped, but said to be frequently out of order. The drains are principally stoneware pipes, jointed in cement. None pass under the buildings.

The latrines are placed in brick and slate covered sheds: they have no divisions between the seats, and require light and ventilation. They are flushed by the ordinary flushing apparatus, and are not constructed on the best principles, for they give rise to nuisance.

There is no day-room.

The refuse and dust are allowed to accumulate before removal, instead of being taken away at once.

*The following are the Sanitary Improvements required for this Barrack:—*

1. Latrines to be ventilated, improved, better lighted, and provided with divisions and doors.
2. Quarters of non-commissioned officers to be ventilated.
3. All the barrack-rooms to be ventilated by shafts in the ceilings, carried above the roof, and by perforated zinc ventilators to admit air near the ceiling.
4. A drying-stove to the washhouse.
5. Reduction of the number of men in each room, so as to afford 600 cubic feet per man.
6. Refuse and dust to be removed daily.
7. Bath accommodation to be increased as far as the space will allow.

## 5.—PORTMAN STREET BARRACKS.

These barracks are in a very confined situation, between Portman Square and Oxford Street. They do not belong to Government, but are held on a lease. The term has expired for some time, but they have been taken on for short periods on several occasions.

The present term would expire in September of this year, but we have been given to understand that they have been taken for a further period of one year.

The area occupied by the inclosure in which the barracks are situated is about 1A. 0R. 13P., and the buildings are intended to hold 539 men, including non-commissioned officers, with a cubic space of 374 feet per man.

They consist of very old two-story brick structures, forming an oblong quadrangle; one end through which is the main entrance by archway, contains the officers' quarters; at the opposite end is the riding-school, now used as kitchen and mess-room; right and left is the accommodation for the men, consisting of 27 rooms, containing (according to schedule) 21 men each.

The following is the allotment of the accommodation:—

| Rooms. | Regulation Accommodation, 21 Men in each Room. | Number of Men capable of being accommodated at 600 Cubic Feet each. | Number of Men for whom there is Deficiency of Accommodation. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 23 | 483 | 276 | 207 | 21 | 12 |

Leaving a deficit of regulation accommodation for 207 men. The actual number of men in barrack is, however, under the regulation number. But there is, nevertheless, great overcrowding.

| | |
|---|---|
| Of the 22 occupied rooms, 20 have 20 men in each, giving accommodation for - - - | 400 men. |
| One room has - - - | 12 „ |
| One room has - - - | 10 „ |
| The total present inmates in the barrack-rooms are - - | 422 men. |
| At 600 cubic feet of space, each room would hold 12 men, or in all - - - - | 264 „ |
| There is a deficit, therefore, in the occupied rooms of accommodation for - - - | 158 men. |

But one room has two fewer than it would accommodate (10 instead of 12), and one room is unoccupied; the actual deficit is therefore 154 sleeping places, or 36½ per cent. of the regulation space.

If this barrack is to be used, it will be necessary to reduce the number on the schedule of occupied rooms from 483 to 276. Also at once to remove 154 men out of it, and to allot the space among the remainder in the proportion of 600 cubic feet for each.

The range of barrack-rooms on the south side of the square is placed with its back close against the very narrow back premises of the houses in Oxford Street; the northern range, on the opposite side of the parade ground, is a very short distance within the limits of the inclosure, and in the long narrow yard which intervenes are placed canteen and barrack-stores, privies, stables, ablution-house, laundry, and ash-pit; the whole space being narrow and confined, and likely in hot weather to be noisome, if not dangerous.

The entire establishment is in very bad repair, the flooring worn out, and the walls in parts projecting several inches beyond the foundation. The surface drainage of the court was very defective at the time of our visit, and allowed water and filth to lie on the surface.

The barracks are two stories high; the rooms run through from front to back; two rooms on each floor open upon the landing or staircase. In the upper rooms, the walls are so low, that the ceiling has been carried up into the slope of the roof, taking the rafters into the room, and the windows being very low also, great stagnation of air takes place in the roof space above them.

The beds are placed close together, and seven feet from foot to foot.

The rooms have two large windows each, one at each end. On the north side the light and ventilation are tolerably good, considering the position and construction of the buildings; on the south, both are deficient, from the rear windows being close upon houses.

Ventilating shafts and ventilators are provided in the ceilings and floors. The ventilators on the floor, in the lower rooms open at the level of the yard, close to the filthy gutters.

The whole of the buildings are in so bad a state of repair, that they may be said to be pervious to air. And there is hence a certain amount of ventilation independent of the windows, and of ventilating openings and shafts.

The barrack-rooms are misappropriated, one to a school room, and one to a library.

The ablution-room is in a ricketty shed in the rear of the northern range of barracks, but there is no bath, and it only contains 22 basins for 422 men.

The privies are near the ablution-room. They are made in ordinary form in the London barracks, without divisions, but they have trap ventilation at the back, over the seat. The sewers and drains are trapped.

The cooking is carried on in this barrack in a large room, formerly a riding-school, where the men also sleep, and which they occupy as a day-room. There are three sets of boilers for cooking, but there are no places for roasting or baking.

Four rooms are appropriated for the serjeants' mess.

The library and school-room are badly lighted and ventilated, and close to the ash-pit.

There is no laundry; nor accommodation for them.

The prison cells are unventilated and unwholesome.

Portman barracks are in a very dilapidated state, and are hardly fit for occupation. They could only be improved by a large outlay of money, and as they are to be evacuated, the only recommendation we were to offer is that this may be done as soon as possible.

## 6.—MAGAZINE BARRACK, HYDE PARK.

This is a small barrack for 83 non-commissioned officers and men, situated on high ground, in the centre of Hyde Park.

The site and isolated position of this barrack, and the structure of the rooms, are conducive to health.

The barrack contains two large and three small barrack-rooms, of which two are appropriated to non-commissioned officers. The larger rooms hold 29 men each, and have a fire-place at each end, and windows on both sides. Each room has ventilating openings in the ceiling, which appear to be habitually closed.

The accommodation is as follows :—

| Rooms. | Number of Men according to Regulation. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Men's Sleeping Spaces in Barrack Rooms. | Actual Number of Men in Barrack. |
|---|---|---|---|---|
| 1st | 14 | 7 | 7 | School. |
| 2nd | 29 | 19 | 10 | 22 |
| 3rd | 5 | 3 | 2 | 1 |
| 4th | 26 | 17 | 9 | 20 |
| 5th | 5 | 3 | 2 | 1 |
| 5 | 79 | 49 | 30 | 44 |

In rooms 2nd and 5th, which are the soldiers' rooms at present occupied, the regulation number of men is 55, while, if each soldier had 600 cubic feet, the number would be 36, showing a deficiency of 34½ per cent. in the accommodation. The actual number of men, however, in these two rooms is 42, or six more than there ought to be.

One room is set apart for a school-room, and ought to be deducted from the schedule.

The rooms are light; they have windows on opposite sides, and also inlets for air.

The ash-pit is badly placed, and too close to the barrack.

The ablution-room is good, but small, and has no bath.

The soil from the privy is flushed into the Serpentine. There are neither doors nor division of seats.

The water supply is derived from a well close to the privies.

The kitchen is very small; it has four boilers, but no means of baking.

There is no laundry, the men's ablution-room being used by the women for that purpose. The cleaning shed is in the rear.

The privy of the guard-room is in a very bad condition.

*The following are the Improvements required for this Barrack:—*

1. If all the rooms are to be used, and if it be necessary to accommodate 79 men in this barrack, additional barrack accommodation will have to be provided for 30 men. But if the school-room is to be continued, the space ought to be deducted from the available accommodation, and the number of men on the schedule reduced from 79 to 42.
2. A wash-house, with drying-stove, to be provided.
3. Coal-store and ash-pit to be removed farther from barrack-rooms.
4. Cleaning-shed to be boarded.
5. Privy to have divisions between the seats, and to be provided with water-trough and flushing apparatus.
6. New privy to be constructed for guard-room.
7. Kitchen to have means of roasting and baking meat.
8. Barrack-rooms to be ventilated by shafts carried through the ceiling to above the roof.

## 7.—KNIGHTSBRIDGE CAVALRY BARRACK.

These barracks occupy an area of 3A. 2R. 35P., being built on a strip of land about 1,142 feet long, and varying from 202 to 92 feet in breadth, bounded by the Knightsbridge road on one side, and by Hyde Park on the other.

They are separated from the Knightsbridge road by a high wall, and the barrack buildings form the boundary on the side of the park. The court-yard is confined, and there is very little circulation of air.

The men's rooms are placed over the stables. Each room opens into a corridor on the side towards the court-yard, with windows looking into the yard, opposite the room doors. On one side, the dung-heap is under the windows, and was very offensive at the time we visited the barrack. The rooms are large but low.

The accommodation, according to the schedule, is for 536 non-commissioned officers and men. The actual number in the barrack is 385.

The space is allotted as follows :—

| Wings. | Rooms. | Number of Men to be accommodated according to existing Regulation. | Number of Men who can be accommodated at 600 Cubic Feet each. | Number of Men for whom there is Deficiency of Accommodation. | Actual Number of Men in Barrack Rooms. |
|---|---|---|---|---|---|
| North 2nd floor | 1 | 11 | 8 | 3 | — |
| „ | 1 | 13 | 10 | 3 | 12 |
| „ | 9 | 180 | 151 | 29 | 155 |
| South 2nd floor | 1 | 13 | 10 | 3 | 1 |
| „ | 1 | 11 | 8 | 3 | 1 |
| „ | 9 | 180 | 160 | 20 | 155 |
| „ | 1 | 13 | 11 | 2 | 10 |
| „ | 1 | 12 | 10 | 2 | 1 |
| „ | 1 | 12 | 8 | 4 | 1 |
| North 1st floor | 1 | 19 | 15 | 4 | 10 |
| „ | 12 | 1 | 3 | — | 1 |
| Married - - | 10 | 1 | 3 | — | 1 |
| East 1st floor - | 1 | 19 | 15 | 4 | — |
| „ 2nd floor - | 1 | 20 | 16 | 4 | 6 |
| Total - - | 50 | 505 | 428 | 81 | 354 |

Of the 50 rooms in this barrack, 26 are appropriated to one man each, and are set apart chiefly for married people and their families.

Excluding those rooms in which there is one man only in each, according to the regulation, and two troop-rooms unoccupied, the regulation number of men in the 22 remaining rooms is 425; but the number these rooms would contain, at 600 cubic feet per man, is 363. The regulation number, therefore, exceeds the available space by 62 men.

The actual number of men in these 22 rooms is 348, which is 15 less than they would hold.

The men are unequally distributed, thus :—

1st.—In every room the actual number is below the existing regulation.

2nd.—In one room there are 12 men where the existing regulation gives 13, and where only 10 should be, at 600 cubic feet each.

3rd.—In 9 rooms there are 155 men, where 151 ought to be, at 600 cubic feet each.

4th.—In 9 rooms there are 155, where 160 might be, at 600 cubic feet each.

5th.—In 1 room there are 10, where 11 might be.

6th.—In 1 room there are 10, where 15 might be.

7th.—In 1 room there are 6, where 16 might be.

In the occupied rooms, then, some re-arrangement might be advantageously made; but, with one single exception, no room contains more than the proper number.

One room, with accommodation for 11 men by regulation, but actually for 8, is unoccupied.

One room, with regulation accommodation for 13, but actually for 10, has 1 occupant.

One room for 11, but actually for 10, has 1 occupant.

Two rooms for 24, but actually for 18, have 1 occupant each.

The additional available space in the barrack (exclusive of 22 rooms set apart for 1 person each, by regulation) would thus accommodate, according to regulation, 59 men, but the cubic space would hold only 46 men.

If we deduct from this the 4 occupants of these rooms, it will leave available space for 42 men, which, added to 363 men (the number that can be accommodated at 600 cubic feet for each) will give an available accommodation for 405 men. The actual number in barracks is 352.

Hence, according to the regulation proposed by the Royal Commission of 600 cubic feet per man, the troop-rooms would hold 53 men more than the present number.

Deducting the 22 married men from the total regulation number 536, the troop-rooms, if all occupied, ought to hold 514 men, according to regulation; but at 600 cubic feet they would hold only 405, showing a deficiency of accommodation for 109 men. It will be necessary, therefore, to reduce the regulation number to $405 + 22 = 427$ in the barrack, and allot 600 cubic feet per man room by room.

The ventilation of the barrack-rooms is effected by openings under the windows, and by ventilating openings in the ceiling into the space under the roof; also by windows in the partition separating the rooms, an arrangement which is much complained of.

The non-commissioned officers and married privates occupy some of the rooms, with spaces partitioned off for four families in each room; many of these partitioned spaces are without openings to the external air, and are close and unwholesome.

The building is lit partly by gas and partly by candles.

There are a school-room and library, both of tolerable size. There is no day-room.

There are two ablution-rooms, with slate benches, and a good supply of water, but they are damp and ill-ventilated, and are not provided with baths.

Two rooms are appropriated as a laundry, with coppers and an open fire-place. A proper drying-stove is much required.

There are four kitchens, which have neither ovens nor any means of cooking except boiling.

There are two cleaning rooms.

All the above offices are situated on the entresol, which is low-pitched, close, and unwholesome.

There is a tailor's shop, very close and unventilated. Also a shoemaker's and saddler's shop, and a farrier's and shoeing shed.

8,000 gallons of water are supplied daily by the Chelsea Water Company. Up to 1849 this barrack was supplied from the Serpentine.

Barrel drains run under the whole extent of the barrack-yard, and under part of the building, to the main sewer in the road adjoining. All are trapped.

The latrines are provided with Salter's self-acting apparatus, which, when we inspected the barrack, was out of order. They are connected with the main sewer by drains. They are dark and offensive, and without separation of seats.

The cells for prisoners are damp; and the ventilation is obstructed by proximity to the wall of the barrack.

The guard-room is large but not well ventilated, and dark.

There are four urinals in the corners of the inner quadrangle; they are without water.

The hospital of this barrack is very badly placed. It is only nine feet from the barrack wall, in front, and 12 feet from the buildings in the rear. The wards have no thorough ventilation across them, although there are ventilators in the ceilings. The store-rooms are dark and damp. There are no baths attached to the wards.

There are three wards on the first floor, one spacious and good. There are water-closets between the wards.

The dispensary, consulting-room, and store-rooms on the ground floor are damp and dark. The packs and bedding are in the same store.

The ash-pit is in front of the hospital, close under the windows, and uncovered.

The whole of this barrack is saturated with a smell of the stables, which are separated from the living-rooms by the flooring, and a lath and plaster ceiling only. As we have already stated, the dung-heap is, in one place, under the windows of the men's rooms, and very offensive.

The staff officers' quarters, which are over the infirmary, stables, and boxes for sick horses, are much complained of.

*The following are the Sanitary Improvements required :—*

1. Ablution-rooms to be ventilated, wooden gratings to be laid down for the men to stand on. Baths to be provided.

2. All the rooms of non-commissioned officers and married privates, and all barrack-rooms to be ventilated by shafts carried up from the ceiling of each room above the roof, and air to be supplied by air-bricks and perforated cornices close to the ceiling of each room. Similar ventilation in the tailors' and other shops to be provided.

3. Means of roasting and baking to be supplied to the kitchens.

4. The stables to be thoroughly ventilated by shafts carried directly above the roof.

5. The stable doors opening into the passages at the foot of the staircases to be built up, and new doors to be opened into the court-yard.

6. Separation of seats in latrines.

7. Additional ventilation of cells for prisoners.

8. Horse infirmary to be removed from under the quarters of staff officers, or staff officers to be accommodated elsewhere.

9. Arrangements to be made for the daily removal of stable manure and barrack refuse.

10. Re-arrangement of men in each room, so as to give 600 cubic feet per man.

11. If this barrack is to continue in use, it will be necessary to provide a new hospital upon a proper plan on a suitable site.

## 8.—REGENT'S PARK BARRACK.

These barracks stand in an open situation, on high ground, between Albany Street Regent's Park, and the Regent's Canal. They occupy, with their enclosure, an area of about 8A. 1R. 7P.

The hospital is within the enclosure, and a school and a chapel are in course of erection.

The barrack-rooms are over the stables; they open out of a central passage. The ventilation, such as it is, is effected by perforated openings in the ceilings, and gratings in the skirtings of rooms. But it is not sufficient.

The passage between the rooms is badly ventilated.

The barrack is lighted by gas.

There is in this barrack accommodation, according to the schedule, for 397 men, including non-commissioned officers.

There are 30 troop-rooms, each accommodating 10 men under the existing regulation, or in all 300 men. There is 1 troop-room for 13 men; 1 for 16; 1 for 14.

The entire number of rooms ought, according to regulation, to accommodate 343 men. This number would have from 640 to 722 cubic feet per man.

300 men in these rooms would have by present regulation 640 cubic feet each.

At 600 cubic feet each, the rooms would accommodate 20 men more than the present practice requires, that is, they would hold 363 men instead of 397, the number on the schedule.

The actual occupants of the troop-rooms are 282 men.

No re-allotment of space or reduction of present numbers is necessary. But the number on the schedule should be reduced from 397 to 363, and the space divided in the ratio of 600 cubic feet per man.

The non-commissioned officers' rooms near the street require additional ventilation, and the passage leading to them is dark and badly ventilated, from the absence of windows towards the street. Windows can be so placed as to light these passages, without enabling the men to look out from them to the annoyance of the inhabitants of the opposite houses. This necessary improvement should be carried out.

There are three ablution-rooms, with one boiler and bath. Of these ablution-rooms one is good, the others damp and narrow. The water supply is not sufficient to allow the men to have baths, and even if it were, the number of baths is insufficient.

The cook-houses only provide for boiling the rations, and are unprovided with ovens.

There is a laundry, with three coppers, but it is not complete in other conveniences. It has no means of drying linen.

There is no special accommodation for married soldiers, but only for married non-commissioned officers.

There are five cleaning-rooms, a farrier's shop, and forge, and a tailor's and saddler's shops, the latter of which are very badly ventilated.

The drainage is in good condition; the drains are constructed partly of brick and partly of earthenware pipes, and are all trapped. One drain passes under the building, several feet below the foundation.

The latrines are provided with Salter's self-flushing apparatus, but are without divisions or seats.

The ash-pits and manure heaps, when we saw them, were full of refuse, uncovered and offensive.

The hospital of this barrack is commodious, and adapted for its requirements as a regimental hospital. It is ventilated from the ceilings.

*The following Sanitary Improvements are required:—*

1. All the barrack-rooms and shops to be ventilated by shafts from the ceiling rising above the roof, and with air-bricks and perforated cornices near the ceiling, on the plan recommended for the other barracks. Windows to be opened so as to light and ventilate the long passages on the side next Albion Street.

2. Division of seats, and doors to be placed in the latrines.

3. Stable manure receptacle to be raised and paved, and arrangements to be made for the daily removal of the manure and barrack refuse.

4. Parade ground to be drained.

5. Accommodation on the schedule to be reduced from 397 to 363 men, and 600 cubic feet of space to be allotted for every man.

6. Bath accommodation and ablution-rooms to be enlarged and improved. Water supply to be increased.

7. Kitchen to be provided with means of baking and roasting meat.

8. Laundry to be provided with drying stove.

9. Married soldiers' quarters to be provided.

## 9.—OLD CAVALRY BARRACK, KENSINGTON.

This consists of one long room for 44 men, with serjeants' and officers' quarters. The men's room is over the stable.

The whole is in a very old and bad state. We were informed that it is to be pulled down, which is the best thing to be done with it, as it is not fit for habitation.

## 10.—KENSINGTON INFANTRY BARRACKS (OLD).

These are old barracks for 80 men, placed at the back of Kensington Palace.

The rooms are low pitched, and badly ventilated.

The staircases are of wood, narrow, and circuitous.

As this barrack is to be abandoned, further remark is unnecessary.

## 11.—KENSINGTON NEW BARRACKS FOR CAVALRY AND INFANTRY.

These barracks have just been completed; they are intended to contain about 200 infantry and 60 cavalry. They cover with their enclosure an area of 1A. 3R. 2P.

The infantry barracks are three stories high, and the cavalry two.

They consist of two main buildings, running north and south, of which the eastern one is appropriated to the infantry, and western one to the cavalry.

The infantry barracks have rooms on both floors; in the cavalry barracks the men's rooms are over the stables, an arrangement to which we have already objected, although, in this instance, additional precautions as to ventilation and for preventing the passage of effluvia into the men's rooms have been adopted.

The non-commissioned officers' quarters are at the ends of the buildings.

The men's rooms open out of a corridor, the windows are opposite the door, and the fire-places in some cases between the windows, and in some cases in the side wall. These rooms have windows to the outer air only on one side.

The rooms are lofty; they have ventilating openings on a level with the floor, which will to a certainty be closed by the men, and also openings in the ceiling; these latter are connected with wooden flues, which all unite, and are carried up into one shaft, passed through the roof.

The window space throughout the building is too small, but the windows giving a borrowed light from the corridor can be enlarged.

The non-commissioned officers' rooms are altogether deficient in ventilation.

There is no accommodation in the cavalry barracks for married non-commissioned officers, or privates whose wives are "allowed."

There is neither laundry, school-room, nor non-commissioned officers' mess room. The staircases

and floors of corridors are of wood instead of stone, and the window space throughout the building is much too small.

In the infantry barrack the ablution-rooms are in the basement, and are objectionably dark ; and a bath is to be provided, which will still further diminish the quantity of light. There should be two baths for this barrack. The cook-house is also in the basement, an arrangement which should always be avoided wherever practicable, on account of the damp and fumes which are apt to pass into the men's rooms above.

In the cavalry barrack the ablution-room is on the same floor as the barrack-rooms ; close to the landing a bath is provided, and the cook-house has been placed on the opposite side of the landing.

But this cook-house is objectionable, both on account of its position and from its having no communication at all with the external air, and being surrounded with lath and plaster walls.

The cook-house of the infantry barrack is very small, confined, and dark.

The privies have been constructed with divisions, in consequence of a suggestion which we have made to the officer commanding Royal Engineers. They are flushed by Salter's apparatus.

We recommended certain improvements in this barrack on the spot ; such as the lighting and ventilation of the kitchen in the cavalry barrack, and the introduction of inlets for fresh air into the upper part of the corridors and rooms, for improving the ventilation ; also the admission of more light into the reading room, &c. The other requirements we have specified ought also to be supplied, as far as consistent with the state of the works.

This completes the list of barracks occupied by the Household Brigade in London.

## 12.—WINDSOR CAVALRY BARRACK.

These barracks form three sides of a quadrangle, the officers' quarters forming the centre, and the men's rooms and stables the two wings. The site is open and airy, at a little distance from the town. Each wing of the building consists of a long line of stables, over which are the barrack-rooms. These rooms are ranged on two sides of a central corridor, running the whole length of the building, and lighted only at the two remote opposite ends. The rooms enter right and left from the corridor, and have a window opening to the external air only on one side.

The following is the accommodation in this barrack :—

There are eight cavalry serjeants' rooms, with two men in each, affording 1,120 cubic feet per man.

Eight serjeants' rooms, with two men in each, and 896 cubic feet per man.

Four serjeants' rooms, with 25 men in the four, and 750 cubic feet per man.

There are 15 soldiers' rooms, which afford 448 cubic feet per man.

There are 19 soldiers' rooms, which give 500 cubic eet per man.

The following table gives the details of the men's accommodation :—

| Number of Rooms occupied by Men. | Total present Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 15 | 120 | 90 | 30 | 8 | 6 |
| 19 | 171 | 133 | 38 | 9 | 7 |
| 34 | 291 | 223 | 68 | — | — |

In the occupied soldiers' rooms there is, therefore, considerable overcrowding, and, in order to give to each man the due allowance of 600 cubic feet, two men will have to be removed from each barrack-room.

Eight rooms have been misappropriated for school-rooms, library, serjeants' mess, and kitchen, band practice and store-room.

These eight rooms, if otherwise suitable, would give about half the additional accommodation required for the men to be removed from the other rooms.

Besides deficiency of accommodation, this barrack has no day-room, no bath-room, no laundry, no specific accommodation for married non-commissioned officers and soldiers, no means of cooking in the kitchen, except boiling ; there is want of room for staff-serjeants ; the means of removing the stable manure appear to be inadequate, and there was a large accumulation at the time we were there. The soldiers' quarters present the great defect of being over the stables ; the ventilation is imperfect, the long corridors are dark and unventilated.

The privies are flushed by Salter's patent apparatus, but they have no divisions or doors.

The barracks are stated to be well drained. They are supplied with water partly from the waterworks, partly from wells.

The rooms are warmed by fires and lit with candles; the stairs and passages are lit with gas.

*The following are the Requirements for Health in these Barracks :—*

1. Ventilation of every barrack-room, by a shaft carried through the ceiling and roof, and means of admitting fresh air and diffusing it close to the ceiling.
2. Ventilation and lighting the corridors by grated openings in the floor, corresponding with ventilating skylights in the roof above.
3. Reduction of numbers to give every man 600 cubic feet of space.
4. An oven for baking and roasting to be put up in the kitchen.
5. Bath accommodation to be provided.
6. Manure to be removed at shorter intervals.
7. Latrines to have division of seats and doors.

These are the measures more immediately necessary ; but the other deficiencies above enumerated ought also to be attended to with as little delay as possible.

### Windsor Cavalry Hospital.

This hospital contains 36 beds and four wards, with nine patients in each. The average cubic space afforded to each bed is 733 feet.

The wards are of good height, light, having seven windows in each, and with ventilators in the ceilings, not carried above the roof, and acting imperfectly. There are two fire-places in each ward.

There is neither lavatory nor bath-room, and the only means of bathing is by one slipper-bath.

There is no laundry nor pack store, nor is there any proper store for provisions, or for bedding and other articles.

There is a good dispensary.

The kitchen and means of cooking are both good ; the supply of water is good. The water-closets are sufficient and good, but outside.

No hospital accommodation is provided for soldiers' families.

*We would recommend for this Hospital :—*

1. That a bath-room and lavatory be constructed.
2. That the hospital-yard, which is rather small, be extended rearwards, to afford means of exercise for convalescents.
3. That a privy, lately built outside the hospital walls, not more than 20 feet from the windows of the ward, but having its supply tank actually in the hospital, be removed.
4. That, as nearly as possible, 1,200 cubic feet of

space be allotted for each patient, by removing three beds out of each ward.

5. That the ventilation be improved by foul air-shafts carried from the ceiling above the roof, and by inlets for fresh air near the ceiling.

## 13.—WINDSOR INFANTRY BARRACK.

These barracks are situated in the town of Windsor. They are enclosed among high walls, and are built in the form of three sides of a square. The buildings are three stories in height. The men's barracks are in the centre, and the two sides are made up of quarters, &c., for officers and non-commissioned officers. The buildings are in separate blocks, close to each other at the ends. The local position and the construction of the barrack, surrounded by high walls and buildings, and having the back boundary wall close to the barrack-rooms, renders a thorough ventilation and movement of the external air difficult, if not impossible.

The basements are deep sunk, dark, and damp. They are at present used for lavatories, for which purpose they are not suitable.

The barrack-rooms run from back to front of the building, and have two windows at either end. The distance between the back and front windows is 52 feet, which is much too great to admit of free diffusion of light and ventilation within the rooms.

The staircases leading up to the barrack-rooms are of stone, but the landings are of wood.

There are 29 men allotted to each room by regulation, giving 373 cubic feet per man.

The following is the accommodation :—

| — | Number of Rooms. | Total Number of Men by Regulation. | Total Number of Men at 600 Cubic Feet of Space. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|---|
| | 30 | 870 | 540 | 330 | 29 | 18 |
| Attics | 13 | 52 | 39 | 13 | 4 | 3 |
| Total | 43 | 922 | 579 | 343 | — | — |

The barrack-master's return shows that the actual number of men in barracks, at the time the return was made, was 724. The accommodation, at 600 cubic feet, amounts to 579 men. The number on the schedule is 922 men, showing a deficiency of space for 343 men of the regulation number, and an excess in actual occupation of 145 men over the accommodation at 600 cubic feet per man.

The barrack-rooms are ventilated by air-shafts, carried from the ceiling to the open air above the roof, but as these air-shafts are twice unnecessarily bent in their course, the velocity of the air in them is considerably diminished. Besides which, as they are not separately supplied with air, the fire when it is lit draws the cold air down the shafts on the men's heads, and the shafts have consequently to be closed.

The lower rooms are dark and close, on account of the near proximity of the lofty boundary wall to the windows. The basements under them are also dark and damp. The air is, therefore, liable to become stagnant and moist. These rooms are chiefly inhabited by non-commissioned officers and their families, and on account of their defective sanitary state, arising from darkness, dampness, and defective ventilation, scrofula has appeared among their inmates.

There is neither day-room, covered drill-shed, bath-room, nor laundry belonging to this barrack.

There is no special accommodation for pursuing trades : two rooms were (at the date of the return) misappropriated for the purpose in consequence, one for a tailor's shop, and another for a drill-room.

The kitchen is provided with boilers, and there is an oven in a separate room. But it is not suitable for roasting meat.

The latrines and ash-pit are situated at one end of the buildings, in a narrow confined space, bounded by high walls, and close to the barracks. The latrines are merely open troughs, flushed out with water, but they were very offensive at the time of our inspection, and require improvement. The ash-pit should be abolished, and a suitable space provided instead of it, where an iron cart might stand to receive the refuse, and be removed once a day.

The water supply is partly derived from the water company and part from wells, and appears to be sufficient. The sewers are stated to be in good condition, and the drains trapped.

The defects of this barrack are partly structural. The high wall close to the back of the buildings interferes seriously with the light and ventilation. Unfortunately a public pathway runs immediately outside it, which would require to be diverted if the wall were to be removed further off.

There are rooms with windows opening into gloomy passages ; and the basements are not suitable for lavatories or bath-rooms.

These defects should be remedied with as little delay as possible.

*The following Requirements for Health should be immediately attended to :—*

1. Reduction of numbers of men in every one of the barrack-rooms, from 29 to 18, and in the attics from 4 to 3, and fixing these as the regulation numbers.

2. Admitting sufficient fresh air near the ceiling of each barrack-room to supply the ventilating shafts, through a partial wire gauze, or perforated zinc cornice, removing the bends from the ventilating tubes, and carrying them straight up to the roof. Ventilating non-commissioned officers' rooms.

3. Increasing the light and ventilation of the lavatories, as far as practicable. It would be much better, however, to provide new lavatories and bath-rooms at once.

4. Converting the flushed privies into water latrines, and providing them with suitable divisions of seats with half doors.

5. Filling up the ash-pit and providing an iron cart for the reception and daily removal of barrack refuse.

6. Roasting oven to be provided for the kitchen.

7. Day-room to be provided. The other deficiencies mentioned, as also the want of staff-serjeants' rooms, require to be supplied ; but the points above stated include what is immediately wanted for health.

### Infantry Hospital, Windsor.

This hospital is situated at some distance from the barrack.

It contains 10 wards, giving accommodation for five, six, and nine beds each, and an average cubic space of 767 feet per man.

The passages and staircases are rather narrow. The windows have the upper sash on pivots. There are ventilating beams in the lower, and perforated openings in ceilings of the upper wards, but they do not act satisfactorily, and the ventilation is imperfect.

There are two good waterclosets on both floors, built outside the body of the building, ventilated, and supplied with water.

The hospital is warmed by ordinary fire-places.

The kitchen is good, but means of roasting are wanted.

There is no ablution or bath-room, and the common slipper bath has to be supplied with hot water from the kitchen.

On the outside of boundary wall there is a stagnant noisome ditch, which should be drained and covered over.

There are three rooms for orderlies or nurses.

The passages only are lighted by gas; candles are used in the wards.

There are two water tanks, one supplied from the Thames, the other by rain water. The supply from the former occasionally fails, and is considered too small on that account.

The sewerage is effected by earthenware pipes; it is stated to be good.

There are no pack or bedding stores, and a hospital-serjeant's quarter is much wanted.

*The Improvements required for this Hospital are* :—

1. Allotting 1,200 cubic feet of space for each patient.
2. Draining and covering the ditch outside the boundary wall.
3. Providing a lavatory and bath-room.
4. Improving the ventilation by shafts from the ceilings of some of the wards.
5. Means of roasting for the kitchen.
6. Stores, and a hospital-serjeant's quarters.

## 14.—HAMPTON COURT CAVALRY (OLD) BARRACK.

This barrack is placed in an open, healthy situation near to the palace. It consists of one strip of building, containing stables, with dwelling rooms over them. There is a thoroughfare in front of and around the barrack, without separation by wall.

The building is constructed to accommodate 73 men. It contains two troop-rooms, the larger capable of accommodating 45 men according to regulation, and the smaller 25 men. Both numbers exceed the available space, which in the larger room would afford the regulation number of men no more than 530 cubic feet per man, and in the smaller room only 350 cubic feet per man. To give 600 cubic feet per man would require the regulation number in the larger room to be reduced from 45 to 40, and in the smaller room from 25 to 14. The present occupants of both rooms fall short of both these numbers, so that at present there is plenty of cubic space.

For ventilation there are numerous apertures in the ceilings, with slides to open and close when necessary. In No. 2 room there are five air bricks in the front wall, placed in the centre of piers 4½ inches from the floor, and eight ventilators with slides in the ceilings for foul air.

This barrack was formerly appropriated for the servants of the household when the palace was in the occupation of the Court, and from the large size of the rooms the barrack-master states that they are cold in winter, and that the means of warming are deficient. The fire-places are very open and lofty, and allow of great waste of heat up the chimney.

The guard-room is on the same floor with the troop rooms. It has not sufficient means of ventilation. All the rooms are rather low-pitched, but having windows on both sides, they are light and may easily be ventilated. A screen, or partition, thrown across the larger room would add to the comfort of the men in winter.

There are two staircases of wood leading to the rooms, one of them having communication with the stables by a door on either side of the entrance, which affords every facility for effluvia ascending to the rooms above.

The ablution-room, which is without a bath, is a small portion partitioned off from a small uncomfortable day-room on the ground floor. The latter is fitted with forms and tables, and, being close to the kitchen, is used by the men to dine in.

The wash-house, which serves also as a cleaning shed, is close to the stables.

There are no means of baking or roasting meat in the kitchen.

There are quarters for two officers adjoining the men's barracks. The others, as well as the mess establishment, are accommodated in a hied house.

The stables are lofty, but too crowded.

The surface drainage is carried off by pipes. The latrines are without water or drainage, and are connected with a cesspit. They might be easily arranged as water latrines, and flushed with water.

Close to the latrines, and at the entrance and front of the barracks, are the manure heap and ash-pit, very objectionably placed. This is unavoidable, however, on account of the circumscribed site and want of space; but the nuisance arising from them might be materially diminished by draining and flushing the latrines, and by frequent removal of the stable manure and barrack refuse.

The whole of this barrack is old and in bad repair, and it would not be advisable to expend much money on it. But as in all probability it will continue to be occupied, we would propose to limit our recommendations barely to those matters required for health and decency.

*These are as follows* :—

1st. Reduction of the regulation number of men in the larger room from 45 to 40, and in the smaller room from 25 to 14.

2nd. A wooden partition to be run across the middle of the larger room.

3rd. The throat of each fire-place to be contracted, without diminishing the height of the chimney breast.

4th. The staircase leading up from the stables to be ventilated through the roof, to prevent the effluvia entering the troop-rooms.

5th. Latrines to be reconstructed, and converted into water latrines, and flushed daily; also to have division of seats and doors to them. Manure and ash-pit to be improved.

## 15.—HAMPTON COURT NEW BARRACK.

This barrack contains accommodation for 51 men.

The buildings form three sides of a square, enclosing a very small barrack-yard, in which on one side are placed the kitchen, a small wash-house, privies, ashpits, and urinals, the latter being close to the gate. In the same line are also the manure heap, privy cesspit, and the well which supplies water for the barrack, the latter about 30 feet only from the former.

Opposite to these offices are the stables, with the men's rooms over them.

The rooms are reached by a light and well ventilated staircase, unconnected with the stables, leading to a light central passage, with windows at both ends, and giving access to three rooms on each side.

The rooms accommodate eight men each. They are six in number. In two of the rooms each man has 585 cubic feet of space, and in the remaining four the cubic space per man is 577 feet. The doors open close on the fire-places. They require to be removed to the opposite ends of the rooms.

For ventilation there are two apertures in the ceiling of each room, with slides that can be opened and closed at pleasure.

There is no day-room, library, store-room, or covered shed for drill.

There is no accommodation for pursuing trades, or special accommodation for married soldiers, neither is there any separate sleeping or mess accommodation for non-commissioned officers.

The cook-house is provided with two boilers, but has no means of baking.

Water is obtained from two pumps. It is said to be disliked by the horses, and as the well is dug in a gravelly soil at so short a distance from the cesspit, there is great risk of the well being polluted.

The ablution-room is on the ground floor, between the stables. It is not supplied with water.

The latrines have surface drainage only. The soil is collected in an adjoining cesspit. There is no water for flushing, no division of seats, and the whole arrangement is extremely offensive.

Opening from the principal yard is a still smaller enclosure, containing three loose boxes and dispensary for the veterinary surgeon.

This barrack is built on a gravelly soil, in an open and airy situation, without any houses close to it, to which circumstances alone it probably owes a reputed healthfulness to which its internal structure and arrangements give it little claim. The small extent of area, the arrangement of out-offices, and deficiency in conveniences, render it inadequate to the ordinary wants of even the small number of men it is intended to accommodate.

*The following Improvements might be carried out with advantage to Health:—*

1st. Ventilation of each room by a shaft carried through the roof, and apertures for admitting air through perforated zinc close to the ceiling.

2nd. Moving the doors to the end of the rooms furthest from the fire-places.

3rd. Supplying a roasting oven for the kitchen.

4th. Drainage of the entire barrack to a suitable outfall, and removing the whole drainage of the latrines, stables, urinals, midden-stead, &c., to a safe distance instead of allowing it to penetrate the subsoil and endanger the purity of the water supply as at present.

5. Reconstruction of latrines, and introducing the water latrine with divisions of seats and half doors.

## 16.—GUARDS' BARRACK, CROYDON.

These barracks were originally built in 1797, for the Waggon Train; part of them were used as stables, and they are of slight temporary construction: they are situated on the western side of the town of Croydon, on low ground, about one eighth of a mile from the banks of that branch of the Wandle which rises near Croydon. They are chiefly appropriated to the recruits of the Foot Guards, and are scheduled to accommodate 500 men.

The subsoil on which the barracks are built is gravel, and the surface is raised very little above the water level of the country.

The barracks occupy an area of about 10A. 3R. 2P. in extent.

They consist of three blocks, of two floors each, identical in form. On the lower floors are ablution-rooms, stores, school-rooms, reading-rooms, and barrack-rooms; and on each upper floor are placed two barrack-rooms and non-commissioned officers' quarters; there is a fourth block which contains four large rooms with a passage between them, occupying one floor on the ground.

There are in all 18 rooms, 3 of which are on the construction for 38 men, 7 for 20, 7 for 28, and 1 for 10. Three of the rooms for 20 are temporarily appropriated as school-rooms. Deducting the misappropriations, there are at present 30 men in the rooms beyond the regulation accommodation.

The accommodation in Croydon barracks is as follows:—

| Number of Rooms. | Total Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 7 | 140 | 112 | 28 | 20 | 16 |
| 7 | 196 | 126 | 70 | 28 | 18 |
| 3 | 114 | 87 | 27 | 38 | 29 |
| 1 | 10 | 8 | 2 | 10 | 8 |
| 18 | 460 | 333 | 127 | — | — |

The total deficiency of accommodation is that for 127 men, and the total accommodation will only afford space for 333 men.

To effect the necessary reduction in numbers every room of the first seven in the list must have its number of inmates reduced from 20 to 16.

The numbers in each of the second seven must be reduced from 28 to 18. In the third set of three rooms the numbers must be reduced from 38 to 29 in each; and the room with 10 inmates must have two taken from its occupants.

An addition to the number, over and above that already given, of two men to each room, has been made by order, so that our estimate of deficiency refers solely to the regulation number, and not to the actual number in barracks.

Within the enclosure are situated—a hospital, a building for the officers, covered sheds for drill, a riding-school, and cook-house, privies, &c.

The several buildings are at a distance from each other, leaving the barrack-yard open and airy.

The walls of the barracks are of brick for a height of about four feet, above which they are of wood. The roofs are tiled.

In the three main buildings the rooms are low and deficient in light and ventilation.

The joists supporting the floor boards of the lower rooms, which were originally stables, are laid on the ground, and have no ventilation beneath them.

It is stated that the rooms, especially the upper ones, are cold in winter and oppressively hot in summer. Dampness is also complained of in some of the lower rooms.

Since the beginning of January there have been 26 cases of scarlet fever, 10 of them having originated in the lower rooms of No. 4 barrack. This disease, it is stated, is of frequent occurrence, and is no doubt to be attributed to the nature of the site, overcrowding, and want of ventilation, (also to other circumstances mentioned in the report on this disease appended.)

The upper floor of each block is approached by an outer staircase and gallery, and besides barrack-rooms, contains accommodation for serjeants. Behind each barrack-room, under the slope of the roof, is placed a store closet.

The ablution-rooms are at the ends of the buildings, and occupy what were formerly stables; each contains a bath with means of warming water. The lavatory floors are rough boulder stone pavement, the benches of wood, and of the rudest construction.

A small wooden building, designated as a laundry, is deficient in every convenience and is misappropriated as married quarters. There are two cook-houses, each of which is built round a central chimney; one is fitted with boilers only, the other is supplied with an oven; but this oven is not sufficiently large to bake for more than 100 men.

The seven barrack-rooms are warmed by stoves, the others by fire-places, stoves being placed in the lower rooms. The flues pass through the upper rooms, and assist in warming them. There are three ventilating openings in the ceiling of each room, one of them under control. There are also ventilating openings near the floor.

The privies are flushed every day, but they have no divisions between the seats nor doors.

The water for the barracks is derived partly from the Croydon Waterworks Company, who supply 5,000 gallons daily, for which 100*l.* per annum is paid, and partly from wells which furnish any further quantity necessary for the trouble of pumping.

The guard-room is close and unventilated.

Even were the site unexceptionable, the expense of putting this barrack into good order would be very great, on account of the dilapidated condition of buildings, and the temporary materials of which they are constructed. It would be better to provide another barrack rather than to incur the cost required to put the present one into a thoroughly efficient state. To do so, it would be necessary to take up the floors which are laid on the ground, to raise the roofs, and to introduce ventilation under the floor-

boards, besides other expensive repairs and alterations throughout the entire buildings.

As it will be necessary to occupy this barrack until other accommodation can be provided, we shall restrict our requirements to what are barely requisite for health.

*They are as follows:—*

1. Reduction in the numbers of inmates in every barrack-room to the extent pointed out.

2. The barrack-rooms to be ventilated by means of shafts through the ceilings and roofs and an arrangement to be made for admitting fresh air near the ceiling, through perforated zinc plates.

3. The four large one-floor barrack-rooms in the separate shed near the riding-school should be ventilated through the roof, provided with additional light and with additional fire-places. In their present state they are unfit for occupation. Even the men's boots get mildewed in them, and it was in these sheds that scarlet fever first appeared.

4. The ablution rooms to be put in order, properly paved, and additional bathing accommodation provided.

5. An oven to be provided for each kitchen, in which meat could be both baked and roasted.

6. The ash-pits to be covered, and the privies to have divisions and half doors.

### *Croydon Barracks Hospital.*

The hospital is built of brick, and is situated close to the boundary wall, overlooking a field where pigs are kept, with a manure manufactory connected with the Croydon drainage at a short distance beyond. It is a small defectively constructed building; the rooms are low, badly arranged for ventilation, and much overcrowded. These rooms contain four and eight beds each. The ventilation might be improved by introducing shafts through the ceiling, with a means of admitting air near the upper part of the room, and diffusing it through perforated zinc. It would also be of advantage to enlarge the door leading from the staircase to the gallery, and to shift the present doors of wards from the corners of the latter, by which the waterclosets now close to the entrance of wards would be isolated.

The arrangement of out-offices of the hospital is very defective; there is no bath-room, and the kitchen requires an additional oven, and also ventilation.

The dead house, which is in a confined yard at the back, is very badly placed, small, and inconvenient.

The provision store consists of a small cupboard under the staircase, and there is no accommodation for either packs or bedding.

There is no ablution-room, nor waiting-room for patients.

It is stated that in winter the hospital is cold and damp; that the windows are bad and insecure, and admit the wind.

*The following are the Sanitary Requirements for the Hospital:—*

1. The cubic space per bed allowed in the hospital being not much more than a third of what it ought to be, two-thirds of the beds to be removed out of the wards. Under the special circumstances of the case, and unless additional accommodation can be provided on the spot, we would propose to remove half the beds as a temporary expedient, and that every ward be ventilated from the ceiling in the manner already recommended for the barrack-rooms.

2. A bath, with hot and cold water laid on, to be provided; also an additional oven to the kitchen.

3. Pack, provision, and bedding stores are also much wanted; but to supply these, and other requisites, would necessitate considerable additions being made to the hospital. And, after all, it would hardly be fit to receive sick.

The best course would be to provide a better barrack and hospital on a less exceptionable site.

## 17.—HOUNSLOW CAVALRY BARRACK.

The site of this barrack is not much raised above the level of the Thames, but it is open and airy, and at some distance from other buildings.

It forms three sides of a square, close to the high road, the officers' quarters forming the centre block, and the men's barracks the two wings. The barrack is constructed to accommodate 259 non-commissioned officers and men.

The following is the men's accommodation :—

| Number of Rooms. | Regulation Number of Men. | Actual Number of Men. | Accommodation at 600 Cubic Feet per Man. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 29 | 232 | 290 | 174 | 10 | 6 |

There are 2 non-commissioned officers' rooms with 1 man in each, and 1,954 cubic feet of space. There are 12 non-commissioned officers' rooms with 2 men in each, and 977 cubic feet per man.

There are 29 troop-rooms. The regulation number of men in each of these rooms is 8, giving a cubic space of 488 feet per man. The actual number of men in each room is 10 instead of 8, so that the present cubic space per man is only 390 cubic feet. Each barrack-room would practically contain only 6 men at a little more than 600 cubic feet per man, so that the regulation number of men in these 29 rooms exceeds the accommodation by 58 men, and the actual number in the rooms exceeds the accommodation by 116 men.

The barrack-rooms are over the stables, and are entered right and left from a long central passage, lighted imperfectly by windows at the end, and skylights at long distances from each other. The ventilation is by means of a sliding fanlight over the door, and two apertures in the ceiling of each room with slides, that can be opened and closed at pleasure. There is one large window opposite the door in each room.

The rooms and passages are low pitched and defectively ventilated.

There is no day-room. There are two good cookhouses, one for each wing, with boilers and a pump in each, but no means are provided either for baking or roasting meat.

One room is set apart for a serjeant's mess, but the cooking has to be done in it, owing to there being no kitchen for the purpose.

There is no special accommodation for the families of married soldiers.

There are several misappropriations of men's rooms for school-rooms, library, &c.

The wash-houses are very bad, and wanting in every convenience, excepting boilers. There is no drying apparatus or laundry stove.

There is one detached ablution house placed at the end of each wing. It is inconveniently distant from most of the rooms; is supplied by a pump only. There are no baths. Three at least are required for the strength in barracks.

The forge and other shops for trades are too small.

The manure heaps are here allowed, as in cavalry barracks generally, to accumulate to too great an extent before the dung is removed, and the manure pits require entire reconstruction.

The whole barrack is without drainage in the proper sense of the term, and there is at present no available outlet for the barrack sewage.

The men's privies are the worst we have yet seen. They are neither drained nor supplied with water, and are most offensive.

The privy of the guard-room is badly placed, and communicates damp and unwholesome effluvia to the adjoining cells.

The drainage in rear of the officers' quarters is

complained of. A long open ditch runs along the whole of one side of the boundary wall, and receives the water from urinals, stables, and manure heaps. This ditch is a constant source of complaint, and requires to be properly drained and covered over.

*The following are the Requirements for Health in this Barrack :—*

1. Reduction of the numbers on the schedule of each room from eight to six men, and providing additional accommodation for the men removed from the rooms.
2. Ventilating every room by a shaft, carried up from the ceiling through the roof, and an inlet for air in the wall, near the ceiling, properly covered with perforated zinc.
3. Drainage of the barrack, ablution of cesspools, and draining and covering the offensive ditch on the east side of the barrack.
4. Water latrines, with suitable flushing apparatus, to be provided.
5. Drying stove to be provided for laundry.
6. Bath-room, with hot and cold water, to be provided.
7. Kitchen to be provided with means of roasting and baking meat.

*Hounslow Cavalry Hospital.*

This hospital consists of three stories. It is badly placed, behind the officers' quarters, near to the infirmary stables and their manure heap, and close to the open noisome ditch already mentioned, outside the boundary wall of the barrack.

There are six wards and 38 beds, and the average cubic space per bed is 649 feet.

There are four windows in the larger wards, two at each end. The staircase is narrow, but light and well ventilated.

The wards are partially ventilated by iron gratings placed near the floor, and they have also circular openings in each ceiling communicating with the external air. The ventilation is defective. The lower inlets should be closed, and each ward should have a shaft carried from the ceiling above the roof, and suitable inlets close to the ceiling.

There are no water-closets within the building, and much inconvenience is felt in consequence.

The ablution-room is small and damp ; it is provided with a slipper bath, but there is no fixed bath and no boiler.

There is a covered shed for exercise in the small yard at the back.

There is no laundry, and no hospital accommodation for soldiers' families.

The provision store is only a small cupboard.

Water is obtained from a force pump in the kitchen.

The outside privy is badly constructed, in a damp yard, and is without water. It is close and ill ventilated. This privy is drained to a cesspool in the vicinity.

*We recommend with regard to this Hospital :—*

1. That ventilating arrangements similar to those required for the barrack-rooms be introduced into the wards, and the lower air-gratings closed.
2. That 1,200 cubic feet of space be set apart for each patient.
3. That water-closets connected with the hospital, but separately ventilated, be constructed and drained, and the privy cesspool abolished.
4. That additional bath accommodation, and a suitable lavatory, be provided for the sick.

## 18. THE HOSPITALS OF THE REGIMENTS OF GUARDS.

All these hospitals are situated in streets of Westminster, a low and rather confined locality for the purpose, and they are all, more or less, enclosed among the habitations of the civil population.

All have small yards in front towards the street ; and only one of them, that occupied by the "Coldstream Guards," is open at the back as well as at the front.

The hospital of the "Grenadiers" is more shut in by other buildings than the others, but in accommodation and general construction it stands next to the "Scots Fusiliers," which is greatly superior to the others in every respect, except the site, in which it is inferior to the "Coldstream" hospital.

With the exception of the defects alluded to, the hospitals of the "Grenadiers" and "Fusiliers" are used for the accommodation of about 100 patients each. Some of the wards are of good size, and the offices convenient, especially those in the latter.

The Coldstream hospital is an old building. The staircase is narrow and circuitous, the wards small and low pitched, and the whole inconvenient and ill-adapted. A new building on the same site is, we understand, contemplated.*

These hospitals, though defective as to site and construction, are in good order and kept very clean, especially that of the Fusiliers. They are the property of the regiments, and supported from the stock purse fund of the Guards, consequently they provide for their own improvements.

## 19. GUARDS' LODGING HOUSE FOR MARRIED SOLDIERS.

The lodging house for married soldiers of the Guards is situated in Vauxhall Road. It is of good construction, and gives accommodation to 54 families.

The staircase is spacious, light, and well ventilated. The rooms, which have access from a narrow central passage, are convenient, of good size, well ventilated, and are provided with ranges containing oven, boiler, &c., with other conveniences.

In the basement are laundries, which are provided with a drying apparatus and a wringing machine.

These, as well as other offices, are small and somewhat confined on account of the restricted area of the site. The buildings are, however, at present, at some distance from other buildings, and the position is generally airy.

From 3*s.* to 4*s.* a week is paid by the occupants, who have either two or three rooms each.

There is an abundant supply of water, by high pressure, from large cisterns on the flat roof, which latter is formed of asphalt.

In water-closets, shafts for refuse to basement, sinks, and water supply to each house, general cleanliness, arrangement, and means of ventilation, the whole is admirable, and affords an example well worthy of being followed.

We are informed that this building has been erected at their own risk and cost by the officers of the Guards.

## GENERAL SUMMARY OF IMPROVEMENTS FOR THE METROPOLITAN DISTRICT.

It appears to be advisable to conclude this our first interim report with a few general considerations on the nature of the sanitary improvements suggested by our examination of the barracks of the metropolitan district.

*Cooking.*—We have directed trial kitchens to be constructed in the Wellington barracks, which, we hope, may serve as models on which barrack kitchens ought to be framed, in terms of the requirements for cooking laid down by the Royal Commission.

*Overcrowding.*—One of the most important points in this *interim* report is that of increased barrack accommodation. According to our instructions, we are required to fix the number of men in each barrack-room ; to have the number painted on the door, and to report to the Secretary of State for War the extent of accommodation which ought to be provided, in order to enable the requirement of 600 cubic feet

* These remarks apply to the old hospitals, since rebuilt.

of space, as laid down by the Royal Commission, to be provided for each soldier.

If, in endeavouring to comply with our instruction, we leave out of calculation the new barracks at Kensington, and also the old infantry barracks, the question of barrack accommodation will stand as follows :—

In Wellington barracks there were at the time of our inspection 1,447 men (the regulation number being 1,354) in the cubic space for 1,134 men, showing an excess of 313 men over the accommodation.

In St. George's barracks there were 517 men (the regulation number being 476) in the space for 414, showing an excess of 103 men.

In the Tower barrack there were 732 men in rooms which ought to contain no more than 587, the excess in this case being 145 men.

St. John's Wood barrack was unoccupied, but its rooms would accommodate no more than 121 men instead of 220 on the schedule, showing an excess of 99 men.

Portman barrack contained 422 men in rooms, the regulation number in which is 483 men. The number that can be accommodated at 600 cubic feet each is 276, showing that the actual occupants were 146, and the regulation occupants 207 in excess of the accommodation.

In the Magazine barrack the regulation number of men is 79. Deducting 14 men for a room misappropriated as a school-room, the regulation accommodation would be for 65 men. But the accommodation would only be suitable for 42 men. The actual number of men in the barrack-rooms was 44, a little more than the proper number.

Excluding the excess of occupants over and above the proper regulation number, as having no right to accommodation, the following table shows the comparison between the *regulation* accommodation and the accommodation at 600 cubic feet per man :—

| Accommodation according to existing Regulation. | | Accommodation at 600 Cubic Feet per Man. |
|---|---|---|
| | Men. | Men. |
| Wellington - | 1,354 | 1,134 |
| St. George's - - | 476 | 414 |
| Tower - - - | 732 | 587 |
| St. John's Wood - | 220 | 121 |
| Portman - - - | 483 | 276 |
| Magazine (exclusive of school-room) - | 65 | 42 |
| | 3,330 | 2,574 |
| | 2,574 | |
| Excess of regulation number over accommodation - - | 756 | |

It hence appears that the regulation accommodation in these barracks is intended for 3,330 men, while the actual accommodation is sufficient for no more than 2,574 men, leaving a deficit of space for 756 men. If all the infantry barracks were occupied up to their accommodation at 600 cubic feet per man, they would hold 2,574 men, and no more. If we suppose that Kensington new barrack would accommodate the men displaced by the demolition of Kensington old barracks, it follows that barrack accommodation must be provided for every infantry soldier beyond 2,574, in order to enable our instructions regarding cubic space to be carried out.

The cavalry barracks, with one or two exceptions, are not overcrowded by their present number of occupants, but to prevent overcrowding in the event of any increase of force, the numbers on the schedule of each barrack should be reduced, as already pointed out, and 600 cubic feet allotted to each man.

*Ventilation.*—Another of our recommendations, namely, the ventilation of barracks, involves practical points of considerable difficulty. These we have had under consideration for some time, and, in order to aid us in the solution of them, we have consulted the most competent authorities ; and we have, besides, introduced experimental works which are now in operation, and so soon as we shall have had sufficient experience of their comparative value, we shall report the results in detail.

We have in the meantime laid down as a standard to be attained, that in barrack-rooms provision should be made for the removal of 1,200 cubic feet of air per man per hour.

After a careful consideration and trial of several plans of ventilation, and after examining others in operation in various localities, we have come to the conclusion that in barracks and hospitals already constructed, any general system of ventilation for the entire building would be expensive and difficult to apply ; and that it is therefore necessary that each room should be made independent of the rest, so far as its supply of fresh air is concerned.

In hospitals, the medical officer and the nurses can keep a constant watch over ventilators and prevent them from being tampered with ; but, in barracks, although it is essential that the ventilation should be placed under the supervision of the medical officers ; yet its operation could only be inspected occasionally, and between the times of inspection it must be left very much to the mercy of the soldiers.

It is, therefore, essential that, in arranging for the admission of fresh air, draughts should be avoided as far as possible ; that is to say, that the air intended for the purification of a whole room should not be delivered into it as at present in a mass close to one of its occupants.

The result of our experiments on various systems of ventilation, so far as they have gone, is, that the following arrangement appears to be the cheapest and most effectual method of ventilating barrack-rooms.

The chimney should form an essential part of the room ventilation. But in addition to the chimney, ventilating shafts should be carried from the ceilings of the rooms up through the roof, terminating in a louvred turret to prevent the rain from beating down.

The inlets afforded by the spaces under and round the doors and windows are not sufficient to admit the air necessary to replace that which should be removed by the shaft and chimney ; and hence, when the fire is lighted, these shafts, if their draught is not supplied with air from without, will not only not remove the heated air, but will act as inlets for the supply of air to the chimney and room, and will thus occasion down draughts on the heads of the men. This can only be remedied by providing additional openings as inlets to supply fresh air both to the shaft and chimney.

In order that the air may be brought in with as little inconvenience to the occupants of the room as possible, we have found it desirable to break the force of the current by placing the inlets near the ceiling, and covering them with a board which slants upwards ; the bottom of this board is fixed against the wall, inside the room, below the lower part of the opening which admits the air ; the board itself being inclined at an angle of 45° towards the ceiling, so as to throw the air which enters the room up towards the ceiling. This board extends on each side of the opening. The open space between the upper part of the board and the wall is covered with perforated zinc, the holes of which are from 1-10th to 1-8th of an inch in diameter ; but the part immediately over the opening is boarded over so as to prevent the air from entering the room directly, and to compel it to seek an entrance into the room through the whole area of the perforated zinc. The object of this arrangement is to cause the air to enter with a diminished velocity into the room, and to be more thoroughly diffused, and the area of the perforated

zinc should therefore be from six to eight times, at least, that of the inlet from the outer air.

By removing air from a room and supplying its place with air from the outside, the temperature of the room is lowered; and if the circulation takes place with sufficient rapidity, the temperature would be assimilated to that of the outer air. The velocity with which the air is removed depends partly on the difference of temperature between the inside and outside of the rooms; and as the temperature in the room is diminished, the velocity of circulation is also diminished or arrested.

In very cold weather it is possible that, in some cases, inconvenience would be experienced by a proper amount of ventilation, unless means were introduced of warming the air. It is, hence, very important that whilst the removal of foul air and the supply of fresh air should be ample, the amount of heat maintained in winter should also be sufficient.

The simplest way of effecting this for existing barracks, would be to place an earthenware stove in the passages, under which the fresh air could be admitted and warmed, inlets for admitting air into the rooms being placed so as to open into the passage, at least in cold weather. But this plan has the objection that it would make the ventilation of the rooms opening out of the passage common to all of them; the principle of supplying fresh air to the rooms directly from the outer air would be interfered with, and the rooms might be supplied with each other's foul air; all the dust of the passage would pass through the ventilators into the room, and the noise from the passage would also be considerable in the room.

According to the present construction, all barrack-rooms are provided with fire-places, and we think that it is most desirable that (even as a means of ventilation only) this system should be continued; hence, in the case of all new barracks, and of any existing rooms where the cost would not be very great, we have thought it worthy of consideration whether an arrangement could not be made to introduce air into a chamber formed behind the fire, and separated from it by means of firebrick, from whence the air moderately warmed would pass up and be admitted into the rooms, near the ceiling, as before described.

By this means a saving would be effected in the fuel otherwise necessary to warm the rooms when ventilated during cold weather. We have found that the fireplaces in most barrack-rooms have been constructed without any reference to that form of grate which would afford the largest amount of heat with the smallest expenditure of fuel. We have thought this subject deserving of immediate consideration, because even if, by furnishing properly devised grates, no saving of fuel is obtained for the public, the present allowance of fuel would be much more effectual for providing for the comfort of the men. The principles upon which fireplaces in barrack-rooms should be constructed are, that the grate should be placed as forward as possible; the sides and back should be of fire-brick; the sides should be splayed so as to throw the heat as much as possible into the room; the opening into the chimney should never be closed by a *register;* and the height of the chimney breast should never be less than 3 feet 6 inches.

In guard-rooms, where the application of the method of warming the air suggested above would be easy, and not very expensive, we think it desirable that the admission of air should be managed so as to ensure its being warmed, a shaft for exit being provided at the ceiling.

In serjeants' rooms, married quarters, and small rooms, a similar arrangement for the admission of warm air is desirable. An Arnott's ventilator, with a silk valve, should be placed in the chimney to assist the removal of the foul air when the fire is not lighted; or, when gas is used, it would answer quite as well to lead a pipe, about two inches in diameter, into the chimney from a funnel in the ceiling, over the gas, through which the products of combustion, as well as much of the impure air of the room, would pass into the chimney.

We would here observe that the contents of quarters for married men consisting of single rooms should not be less than from 1,500 to 2,000 cubic feet.

In hospitals the amount of impure air to be removed by open windows, chimneys, and foul-air shafts, should be at least 3,000 cubic feet per hour per patient.

We think it very desirable that the air of each ward in a hospital should be derived directly from out of doors, without the possibility of mixing with the air of other wards.

We should therefore propose that, when it can be done, the air should be brought in behind the fireplace, to be warmed in a chamber lined with firebrick, and admitted into the room near the ceiling, an inlet for air being also placed so as to bring in air directly from without, and a shaft being carried up from the ceiling to remove air from the top of the room.

In other words, we propose to introduce *natural ventilation* instead of any artificial method, only facilitating, by the proper arrangement of inlets and outlets for air in a room, that circulation which naturally takes place as soon as the balance of the atmosphere has been disturbed in any particular place by difference of temperature or by winds.

Besides the simple methods indicated above, various forms of ventilators for barracks and hospitals have been proposed to us for ensuring more or less perfectly similar results. It would be premature at present to enter into any discussion as to their efficiency, but we shall do so on a future occasion.

*Privies, Urinals, and Urine Tubs.*—In the privies of the barracks in London, the almost universal arrangement is for the soil to fall into a receptacle containing water, which is flushed once or twice a day.

Having regard to the trouble which is required for keeping ordinary water-closets, or even common soil pans, free from being choked, and also having regard to the very large number of privies required in a barrack, we do not think that any other arrangement would be so simple and effectual as the one in use, provided the receptacle be not too deep, and the means of flushing be ample, and be used frequently.

The seats should be separated by a partition, and *doors*, or rather *half doors*, should be provided to cover the upper part of the opening between the partitions where it can be done without difficulty.

For ventilation, a louvred turret should be placed above the roof, inlets for air being provided in the most convenient places, either by air-bricks or perforated panes of glass.

With regard to light, we think that there should be, at least, one superficial foot of opening to each seat, but more would be desirable where it can be introduced without difficulty.

Urinals should not be under the same roof with the privies, but should be protected from rain, and should, if possible, be constantly supplied with water.

We have considered very carefully the question of what substitutes should be made for *urine tubs*.

We have examined a great variety of fixed urinals, but we fear that they would be found offensive if placed in barrack-rooms or on the staircase landings, and that if employed at all, it must be in recesses projecting from the main building and admitting of thorough ventilation.

The expense of making such an arrangement in existing buildings would be considerable. We think that in new barracks it would be desirable that a fixed urinal should be placed near each barrack-room, and a water-closet erected for each staircase.

For existing barracks freedom from nuisance would apparently be best secured by the use of a

moveable utensil, and we have a number of forms on trial; but as yet no positive results have been arrived at sufficient to warrant us in recommending any general substitute for the present urine tub.

*Cooking.*—The means for baking and roasting, as well as boiling and stewing, together with a small supply of hot water, should be provided in all permanent barracks.

The apparatus for these purposes should be of simple construction, and capable of being easily cleaned.

A boiler and roasting oven, with means of regulating the fire, will, so far as we have had experience, afford every required means of varying the soldiers' cooking.

For camp purposes we believe that the most economical arrangement will be to adopt Soyer's iron stoves; they are very simple, and not liable to get out of order. They dispense with brickwork, which becomes injured by the fire.

We have various simple and economical arrangements of ovens and boilers for barrack and hospital use at present on trial, the result of which will no doubt enable us to introduce improved forms of cooking apparatus.

But something more than a mere cooking apparatus is wanted. The soldier requires instruction as to the best mode of preparing his food, so that he may derive the greatest amount of nourishment it is capable of yielding. At present, his ration of meat is not unfrequently issued in small portions instead of joints; thrown into cold, warm, or boiling water, as may be most at hand, and a large and strong fire kept up from the beginning to the end of the process. The result is indifferent soup, and nothing more. It is all the soldier gets in the shape of nourishment from the meat. We, therefore, recommend that a few plain directions as to boiling, roasting, and stewing should be hung up in a conspicuous place in every barrack kitchen.

The adoption of this recommendation would, in our opinion, tend greatly to improve the cooking of the army.

We further recommend, that for a limited period one man in each regiment should be told off to learn and teach such a system of cooking as may be approved of, until the method be thoroughly established among the men.

*Conclusion.*—The barracks of the London district may be considered to be a favourable type of the barracks which exist in the United Kingdom. The main feature for notice in them is, that no uniform system has been pursued in originally designing them. No doubt when the officer in charge took an interest in works of this description, details have been attended to, and improvements made; but these details and improvements have not generally been the result of any system laid down by a central department, but have depended upon the energy or knowledge of the officer employed.

Neither has there been any method pursued in respect of sanitary requirements. Ventilation has not been systematically attended to; in the rare cases where the privies have been improved, it has been done upon no uniform plan; the cook-houses contain conveniences or not, according to the more or less importance attached to them by the designer.

It is not that money has not been spent upon sanitary arrangements, but the money so spent has not been applied upon defined principles, and hence barracks exhibit so few of those systematic arrangements for health and convenience which have been introduced of late years into the model dwellings for the labouring classes.

At the same time we must call attention to the fact that the barrack department has for the last two or three years appropriated 40,000*l.* per annum to improving existing barracks, which sum has chiefly been systematically spent in providing married quarters.

Previous to the Russian war, before the Ordnance was transferred to the War Department, Sir John Burgoyne had directed the commanding engineers, at the principal home stations, to consult the surgeons, barrack-masters, and commanding officers, upon the defects of the newly constructed barracks, to obtain a sound basis for future improvements, and valuable reports were received in reply.

With these remarks we beg to conclude this interim report, which we have thought it right to prepare, in order that the Secretary of State for War may be made acquainted with the character of the more prominent sanitary defects in these buildings.

We append a rough estimate of the cost required for the removal of the evils which we have pointed out, from which it will be seen that independently of the *additional accommodation* required, it is not so much a large expenditure of money, as the application of the money in a judicious manner which is necessary for the removal of the principal existing sanitary defects of the barracks in the London district.

SIDNEY HERBERT.

## ADDENDUM TO REPORT ON CROYDON BARRACKS.

### *Report on the Fever in the Guards' Barracks, Croydon.*

In compliance with the request contained in Lord Hardinge's letter of the 4th November 1858, to the Right Hon. Sidney Herbert, the Barrack and Hospital Improvement Commission have made inquiry and personally examined into the circumstances connected with the occurrence of fever among the recruits of the guards in the barracks at Croydon, and into the alleged connexion of a manure manufactory in the vicinity of the barracks with the appearance of this fever, and they now have the honour to report the result, briefly, as follows:—

The returns made to the commission by the medical officer in charge, show that between the 1st August and 8th October, ult., there were 18 cases of fever and two deaths among the recruits, out of a mean strength of 239; that the proportion of attacks was much higher among the grenadiers than among the other detachments, and that the two deaths likewise took place among them. The fever is described as a simple gastric continued fever, which passes into typhoid fever, after being eight or ten days in hospital, while among the cases which recover the convalescence is very tedious and the men return to health very slowly.

From inquiries made in Croydon itself, it appears that during the same period there were a number of cases of fever in the town, and that nine deaths were registered from typhoid, typhus, and bilious remittent fevers. There was at the same time a considerable amount of sickness over the district in which the barracks are situated, proving that the troops were not the only sufferers.

It is necessary here to mention that the present fever is by no means the only epidemic disease which has prevailed in these barracks. They have frequently been affected before, and scarlet fever prevailed in them to some extent during the last spring and summer, from causes similar to those now existing.

With this brief statement of the facts, we proceed to describe the causes:—

1. The ground occupied by the barracks is very low, and its means of drainage most defective. The whole district, except the higher parts of Croydon, is exposed to the influence of wet undrained land, and

the site occupied by the barracks is on that account alone objectionable. So strongly was the commission impressed with this fact, that in their report on the metropolitan barracks of 8th June ult., they recommended the removal of the whole establishment, rather than to incur the cost of rebuilding it in a healthy manner, a recommendation, the propriety of which has been further confirmed by what has just taken place.

2. At a distance of about 200 yards from the barracks is situated the outlet for the whole sewage of Croydon, which passes into a covered tank, where it is filtered, and from which it flows into open shallow reservoirs to be deodorized by charcoal and converted into manure. The process gives rise to great nuisance, as the prevailing winds blow over the place towards the barracks, and the faint sickly odour proceeding from it can be detected all over the barracks. There has been so remarkable a coincidence between the degree of direct exposure of different barrack-rooms to the air moving from this nuisance and the proportion of attacks of fever among the men, that we cannot escape from the conclusion that this manure manufactory has been an instrumental cause in predisposing to the fever. There is besides another similar nuisance in a line between the manure manufactory and the barracks, which has no doubt added to the evil. It is a large pig-sty, where pigs are fed on slaughter-house offal, from which offensive effluvia proceed, but to a very inferior degree as compared with those from the manufactory.

3. Besides these external causes of disease, there are other causes within the barracks themselves, which were described in our former report alluded to. The two fatal cases of fever did not occur in that part of the barracks most exposed to the nuisance, but in one of the No. 4 shed barrack-rooms, each of which has 38 men in it. The flooring of these sheds is laid on the damp subsoil, without any ventilation below, and the rooms were, moreover, much overcrowded, and they were still unventilated at the time we examined them on the present inquiry.

The ventilation recommended by the commission, in its report referred to, is now being carried out in the other barrack-rooms, but no reduction in the numbers of men has yet taken place in these rooms. The total number of recruits in barracks has been reduced, but this has been done by evacuating rooms. The large barrack-room, where the two fatal cases occurred, has been emptied, a step of which we entirely approve, and two men have been removed out of each of the thirty-eight-men rooms, but the numbers in the other rooms remain as they were.

The causes, then, which, in our opinion, have predisposed the men to fever, are—1. Low damp locality. 2. Impure air from nuisances. 3. Overcrowded rooms. 4. Defective ventilation. There is yet another important cause—not of the attacks of fever, but of their course and termination, which we cannot pass over—and that is the state of the hospital into which the men are received. The commission pointed out in their former report the very defective condition of this building; to which they have now to add, that being directly exposed to the winds blowing from the nuisances referred to, the fever cases brought from the barrack-rooms are perhaps more exposed to the emanations in the hospital than they were before their removal there.

We found lingering cases in hospital of seven or eight weeks' duration, of which the first symptoms had been very mild, and by no means indicating so long a period of convalescence. All the cases of typhoid had become so in hospital, after having been a certain time there. The position and structure of the hospital itself have, therefore, been influential causes in the course which the fever has taken.

In regard to the precautionary measures required, the commission have little to add beyond what they formerly stated.

1. The sooner another barrack for drilling the recruits of the guards is provided, the better. A similar remark applies to the hospital.

2. In the meantime, they would recommend an order to be issued for completing the ventilation in No. 4 barrack, for lime-washing all the barrack-rooms, and for allotting in every barrack-room 600 cubic feet of space per man. To do this, it will be necessary to remove four men out of every twenty-men room. Ten men must be removed out of every twenty-eight-men room, and nine men out of every thirty-eight-men room. Two men must also be removed out of the ten-men rooms.

3. The manure manufactory, or "filter house," as it is called, has been long a cause of nuisance and of complaint in the town. Its removal has been determined on for some time; and, on inquiry, the commission has been informed by the surveyor to the Local Board of Health of Croydon that the authorities "are now "rapidly constructing filter works at a more distant "spot, which I hope will be completed about "Christmas next."

The commission would nevertheless recommend that an official notice be sent to the clerk to the Local Board of Health from the War Department, to expedite the works; for if the present nuisance is continued by the authorities, and the troops are to be kept in these barracks, it may become necessary to take legal proceedings for compelling the abatement of the nuisance.

4. The commission would also recommend that complaint be lodged with the Clerk to the Local Board of Health as to the nuisance from the pig-sty, in order that the same may be abated. Evidence of nuisance in both cases can be obtained from the barrack-serjeants and others.

*Lastly.*—With regard to the hospital. It is altogether unfit for the treatment of fever cases. And the commission would advise that the medical officer have placed at his disposal a suitable barrack-room for the reception of his sick, until the fever ceases in the locality.

---

## WOOLWICH.

SIR,

HAVING inspected and made inquiry into the condition of the barracks and hospitals at Woolwich, we have the honour to lay before you the following Report:—

The royal artillery barracks at Woolwich stand at the northern end of the sloping ground which lies between the foot of Shooter's Hill and the town of Woolwich.

On the north side the barrack buildings are close to the town; on the south side they are open to Woolwich common.

The site is elevated about 122 feet above high-water mark, at a distance of three-quarters of a mile from the river. The soil generally is a mixture of sand and gravel.

The barracks are substantially built of brick; they were erected at various periods between 1801 and 1809, but several considerable additions have been made to them within the last few years.

The hospital is placed on the eastern slope leading down to the town.

The establishment covers an area of about 19 acres. Together with the huts on Woolwich common, the barracks are capable, under the present regulation, of containing 4,822 men.

They consist of a long front range of buildings facing the south, divided in the centre by an archway.

In rear of each division of the front range stands a large square for the horse artillery, and between the squares and the front range are placed staff serjeants' quarters, the gymnasium, &c.

Behind each of the squares there is placed a long range of barracks for the field batteries.

The barrack-rooms in the front range are constructed with a basement, a ground floor, and two stories above; those over the stables in the square

are one story high, and each of the rear ranges consist of two stories over the stables. The rooms in the basement of the front range are not suitable for barrack-rooms. Basements ought always to be avoided for sleeping-rooms, and no barrack ought to be constructed with basements intended for such a purpose. They are always more or less damp, dark, badly ventilated, and unwholesome.

The rooms, with the exception of those on one side of the squares, are placed back to back, and a staircase and passage afford access to the rooms on each floor.

The rooms are constructed to contain from 12 to 24 men each, with a cubic space of from under 300 to above 700 cubic feet per man.

The following Table shows the contrast between the present regulation accommodation in the royal artillery barracks and what it would be at 600 cubic feet per man :—

| Situation. | Number of Rooms. | Present Number of Men per Room. | Cubic Contents of each Room. | Cubical Space per Man. | Total Number of Rooms. | Total Number of Men. | Men per Room at 600 Cubic Feet per Man. | Total Number of Men in Rooms at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|---|---|---|---|---|---|
| First Floor. East Square. Basement. | 1, 2, 42, 43, 70, 71 - | 12 | 3523·7 | 293·7 | 6 | 72 | 5 | 30 | 42 |
| | 3, 4, 30, 31, 44, 45, 74, 75 | 12 | 3464·11 | 288·8 | 8 | 96 | 5 | 40 | 56 |

| | 227 - - - | 17 | 9751·7 | 573·7 | 1 | 17 | 16 | 16 | 1 |
| Second Floor. Front Range. | 54, 55 - - - | 24 | 8395·0 | 349·9 | 1 | 24 | 14 | 14 | 10 |
| | 10, 11, 12, 13, 26, 27, 28, 29, 38, 39, 40, 41, 56, 57, 70, 71, 72, 73, 86, 87, 88, 89 - | 12 | 4000·0 | 333·4 | 22 | 266 | 7 | 154 | 112 |
| Second Floor. West Rear Range. | 163, 164, 165, 166, 171, 172, 173, 174, 179, 180, 181, 182, 187, 188, 189, 190, 195, 196, 197, 198, 203, 204, 205, 206 - | 20 | 15170·0 | 758·10 | 24 | 480 | — | 480 | — |
| Second Floor. East Rear Range. | 211, 212, 213, 214, 219, 220, 221, 222, 225 - | 20 | 15170·0 | 758·10 | 9 | 180 | — | 180 | — |
| | | | | | 213 | 3,508 | — | 2,750 | 758 |

The total accommodation, according to the existing regulation, in the 213 barrack-rooms in this Table, is for 3,508 men. In 180 rooms there is an excess of 758 men over the available space at 600 cubic feet per man. In the last 23 rooms in the Table there is no excess. The 213 rooms would, therefore, accom-

modate 2,750 men, giving 600 cubic feet to each, instead of 3,508, the present regulation number, showing a deficiency of accommodation for 758 men.

There is a fireplace in each room, placed at the end opposite to the door, and for each room there are generally three windows; there are also rooms with one, four, and six windows each.

The rooms are constructed on what is called the back-to-back principle, that is, there are two rooms in the depth of the building, each room having windows only on one side, and no proper thorough draught.

There are louvred openings between the adjacent rooms, with the view of obtaining a freer circulation of air than the structure affords; but these openings are better away, as they only permit the foul air and noise of adjacent rooms to mingle.

The only means of ventilation in the barrack-rooms is by doors, windows, and chimneys. It is deficient in amount, and would be at once improved by the introduction of foul-air shafts, affording nine square inches of outlet area per man in the lower rooms, 10 in the first floor rooms, 11 in the second floor rooms, and 12 inches per man in the top rooms; these shafts should be placed in the ceiling at one corner of the room; they should be carried up above the roof and should end in a louvred turret. In order to avoid expense, the corner of the room selected to place them should be such that one opening through the roof would serve for the passage of the shafts of as many rooms as possible.

Inlets for the external air, affording seven square inches per man, with means of diffusing the current, should also be made near the ceilings of each room.

The privies for a portion of these barracks have been constructed with divisions and half-doors. This improvement ought to be extended to the others.

The ablution-rooms are of a good size, but additional basins are required. There are no baths in any part of the barracks; these should be supplied in the proportion of one bath for 100 men; the baths should be separated from each other by a partition or a curtain so as to afford privacy.

Generally, the only means of cooking in these barracks is by boiling. In some cases the men send out their dinners to be baked outside the barracks at their own cost.

In one of the cooking-houses behind the front range Captain Grant's cooking apparatus has recently been put up, and is liked by the men.

The apparatus consists of six boilers placed on each side of a central horizontal flue, at the end of which is a vertical oven heated by the superfluous heat. The cast-iron top, in which the boilers are set, answers to some extent the purposes of a hot plate; a great deal of heat is disengaged from the apparatus and lost, rendering the kitchen very warm, and the boilers have to be shifted so as to increase the amount of heat to which their contents are exposed.

The apparatus has, however, the advantage that it has enabled one of the cook-houses to be closed in the portion of the range where it has been established, and thus additional space has been provided where space is the first requirement. It is proposed to convert this cook-house into a bath-house, for which its situation renders it available.

As several arrangements for varying the soldiers' cooking are in use, or have been at our suggestion introduced on trial in different barracks, it would be premature to express any opinion as to which form of kitchen range is best until all have had a sufficient trial.

The dust or ash-pits are, several of them, close to the men's rooms. They are uncovered, and are in many places very offensive; they were particularly so at the time of our visit. In cleansing them generally only the matter at the surface is taken away, while the lowest and most offensive stratum of their contents is very seldom removed regularly, so that nuisance often arises from them.

This remark applies to the whole of the ash-pits we have seen in barracks, and we think that in Woolwich barracks, where the space is so occupied, and where there are of necessity so many ash-pits, iron carts should be provided to receive the refuse; to be removed every day, or at most every alternate day.

The number of carts must of course be determined by the amount of refuse at each place; if there is sufficient to fill a good sized cart every day, it would be desirable that it should be removed daily, and that a duplicate cart be left empty while the full cart is being removed. If they are to be removed on alternate days one extra cart for two carts in use would be sufficient. If the service were properly organized, one or two extra carts only would be required, for the full carts could be removed at different hours in the day, emptied, and brought back to replace other full carts removed. These carts should be supplied by the Government and removed by the contractor.

### *Barrack Squares.*

The barrack-rooms in the squares for the horse artillery are over the stables, and consequently a certain amount of smell from the stables penetrates into the rooms. It is very expensive in existing buildings to make the floor impervious to this smell; and if there be not free ventilation for the stables besides the stable windows, the effluvia which escape by these windows will pass up outside and enter the barrack-rooms above by their windows and ventilators.

For these reasons we think that the best way of preventing the effluvia in the stables from acting injuriously on the men in the barrack-rooms above, is to carry one or more shafts, giving an area of 12 square inches for each horse, from the ceiling of the stables above the roof. Means of admitting fresh air to the stables through perforated panes or such other inlets as may be found most convenient, should at the same time be provided.

The barrack-rooms above the stables are low; on one side of the squares the rooms run through and have windows on each side, on the other there is a central wall, and the rooms have windows on one side only. In consequence of some decay having been discovered in the roof of these barracks, it is intended to renew the roof, and the Commanding Royal Engineer has obtained authority to execute a portion of this service this year. He proposes to take the opportunity of raising the ceilings and heightening the rooms: indeed in the new roofs the principals of the roofs are to be exposed, and he proposes to give ventilation by louvred turrets in the ridge.

Inlets for air would also be required, and these should be placed close to the eaves of the roof.

As the specification for this service has been drawn, we do not think it desirable that the proposed system of ventilation should be altered, but we think it is well deserving of the consideration of the Commanding Royal Engineer, whether in raising the roof of the other portion, shafts would not afford a more efficient system of ventilation, provided the rooms be ceiled, though we are of opinion that the sloping roof tends to promote ventilation, provided there be an outlet at the ridge. We do not think it is desirable to interfere with these rooms until the roof is raised.

The privies and urinals in the squares are too small; they are situated under the barrack-rooms, in the same passage as the lavatories, and are very offensive. These privies and urinals, in our opinion, should be removed altogether, if space could be obtained for them elsewhere. They should never be placed under barrack-rooms. It appears, however, that there is no available locality in which they could be reconstructed, and every means should therefore be adopted to prevent the effluvia from them passing upwards to the barrack-rooms. With this object we would recommend that the ceilings of the privies be covered throughout with sheet zinc; that ventilating

shafts, with as large an area as possible, be carried up from the privy ceiling above the roof of the building; that each privy be reconstructed as a water latrine, with drainage, and flushed twice daily; that more light be supplied to the privies; that all the room doors opening into the passage above be bricked up; and that a door be opened from the gallery on each side the passage, to afford access to the two front rooms; and that the back rooms have each a door from the front room. This arrangement will enable the upper lobby to be converted into a lavatory or bath-room, without the air of the rooms suffering from damp, as the walls of the passages are carried up to the roof. When the present doors are built up, and others opened to the external air, the effluvia from the privies in the lower floor of the passage will be cut off from the atmosphere of the barrack-rooms. The privies should be supplied with divisions and half doors. The urinals should be separated from the privies, supplied with water, and provided with divisions.

The space at present occupied by these privies and urinals, if they could be removed, might be advantageously used for extending the lavatories, and providing bath-rooms.

The privies are generally flushed with water, but it did not appear that the arrangements allow of the water always standing in the trough of the latrine, which is indispensable for preserving the buildings in a good sanitary state.

In all privies constructed to be flushed, the water should stand permanently in the trough and be let off once or twice a day as required, and as soon as it has been let off, a fresh supply should pour in until the trough is full.

*Ranges.*

The ranges at the back of the squares occupied by the field batteries consist of stables, over which are two floors of barrack-rooms; each staircase gives access to eight rooms on a floor; the rooms are placed back to back, and the rooms adjacent to the staircases form passages to the rooms inside; these rooms, as well as the stables, all require ventilation by shafts and inlets for air in the manner already described.

The cook-house requires means of roasting or baking meat.

The ablution-rooms of the ranges are a long way from some of the barrack-rooms. There are no baths.

The privies of the ranges require divisions and half-doors, and the water should stand in the troughs, as already mentioned, and the urinals should be divided and supplied with water.

The barrack-rooms occupied by the riding department are in great want of ventilation by shafts and inlets for air, and if possible additional windows should me made so as to give more light.

A large manure heap near this place is stated to be occasionally very offensive.

The urine tubs in all the barrack-rooms are much complained of. We shall be ready to recommend the discontinuation of urine tubs, so soon as the best form of urinal shall have been determined by experience at present in progress.

Woolwich has been drained under the Public Health Act, and these barracks are mostly drained into the town sewerage.

There are no day-rooms for the men.

There is no laundry.

There are no cleaning rooms.

There are three covered sheds for drill.

The usual workshops for the royal artillery are provided.

Water is obtained from the Kent Waterworks Company, and is said to be abundant in quantity.

All the guard-rooms require additional ventilation through the roof.

The cells and lock-up places are very small, and some of them were much overcrowded at the time of our inspection.

Certain rooms in the basement of the front buildings have to be appropriated for prisoners, and these too were greatly overcrowded.

Additional and larger accommodation for prisoners appears to be required, and great attention should be paid to the ventilation of all these lock-up places.

It would be much improved by air shafts carried up to the roof, as we have advised, for the barrack-rooms and inlets for air.

There is a ball court, but, being uncovered, it is not available in rainy weather when it is most wanted.

The library of the gunners and that of the non-commissioned officers is in the front range; they are both small for the large number of men in the barracks, and ventilation should be supplied to them of the same description as that already described. There is none at present, although the rooms are lighted with gas and often crowded with men.

Most excellent schools have been recently constructed for the garrison. They are well placed, light, and well ventilated.

From the preceding statement it will be gathered that the chief sanitary defects in Woolwich barracks are overcrowding, defective ventilation, defective state of the privies, urinals, and ash-pits, want of sufficient means of varying the cooking in most of the kitchens, want of baths, defects in the lavatories, and unnecessary retention of stable dung in the squares and ranges.

*To remedy these Defects we would recommend:—*

1. Reducing the numbers of men in the rooms, to give, as near as may be, 600 cubic feet per man, in conformity with the preceding Table.

2. Ventilating every barrack-room, guard-room, lock-up, and library, by shafts and inlets, for fresh air, as already pointed out.

3. Improving the privies and urinals under the barrack-rooms in the squares, in the manner pointed out; and improving the tanks of all the privies, so that water may stand in them to a constant level, also providing divisions of seats and half-doors where practicable.

4. Abolition of ash-pits and substitution of iron-carts for the frequent removal of refuse, in the way pointed out; also more frequent removal of stable dung.

5. Introduction of roasting ovens into the kitchens, not yet supplied with apparatus for varying the cooking.

6. Provision of baths in the proportion of one bath for every 100 men. Lavatories to be improved.

7. Stables to be ventilated as pointed out, to prevent as far as practicable the passage of effluvia into the rooms above.

It would be very desirable to provide day-rooms for the men.

*Hut Barracks.*

These barracks are situated on Woolwich common. They consist of 42 huts, arranged in streets running at right angles: with the necessary offices, and four huts for hospital purposes. They are constructed of wood and of corrugated iron. Each hut contains 24 men, with an average cubic space of 285 feet per man.

Although, in our opinion, detached huts are more healthy than permanent barracks, and require less cubic space per man, we still consider that there are too many men in these huts, and we think it would be very advisable to reduce the numbers from 24 to 20 men per hut, which would give about the same cubic space per man as is afforded by the hut barracks at Shorncliffe.

These huts are ventilated at the ridge, and a good plan of warming the air has been recently introduced by making it enter the room through a brick wall compartment behind the fire-grate. A ventilating shaft is also introduced alongside the chimney. The

plan is well worthy a trial. The latrines of these huts are good, but they are not sufficiently lighted, and would have been better placed at the outskirts of the camp.

The kitchens have no means of cooking except by boilers. An oven is required in each kitchen for roasting meat. The lavatories require gratings for the men to stand on. The lavatory tables are of wood, and not in a good condition. If these huts are to be continued in use, tables of slate should be substituted.

There are no baths. One should be provided for every 100 men.

The *hospital* consists of four men's huts set apart for sick. They are close to the latrines, and to the ash-pit and dung-heap. It would be much better to provide a proper hospital, and restore the huts to the men.

*The chief Sanitary Improvements required for these Huts are thus:—*

1. Reduction of numbers to the extent specified.
2. Providing a roasting oven for each cook-house.
3. Providing gratings for the men in the lavatories.
4. Baths in the proportion of one bath to every 100 men.

Arrangements should be made for the more frequent removal of manure from the stables, and for the collection and daily removal of other barrack refuse.

### Royal Artillery Hospital.

This building consists of one long range, with another joined to it at right angles at the middle. It stands on the slope of the hill, considerably lower than the barracks.

It contains 72 wards, having access from central passages and corridors. Several of these passages are gloomy, and have no independent means of light or ventilation, and when the outer doors are shut, the only light and air they receive comes through windows on pivots over the doors, communicating with the wards on either side of the passages.

The following Table shows the present regulation accommodation for sick in the royal artillery hospital, as compared with the accommodation at 1,200 cubic feet per bed :—

| Situation. | Number of Ward. | Present Number of Men per Ward. | Cubic Contents of each Ward. | Cubical Space per Man. | Total Number of Wards. | Total Number of Men. | Men per Ward at 1,200 Cubic Feet each. | Total Number of Men in Wards. | Deficiency of Accommodation in Beds. |
|---|---|---|---|---|---|---|---|---|---|
| Ground Floor | 1 to 10 | 6 | 3513·0 | 585·6 | 10 | 60 | 3 | 30 | 30 |
| | 11 | 12 | 8835·11 | 736·4 | 1 | 12 | 7 | 7 | 5 |
| | 12 | 14 | 12075·0 | 862·6 | 1 | 14 | 10 | 10 | 4 |
| First Floor | 13 to 22 | 6 | 4812·9 | 802·1 | 10 | 60 | 4 | 40 | 20 |
| | 25 to 32 | 6 | 4932·0 | 822·0 | 8 | 48 | 4 | 32 | 16 |
| | 57, 58, 61 | 6 | 4873·8 | 812·3 | 3 | 18 | 4 | 12 | 6 |
| | 62 | 6 | 3511·9 | 585·3 | 1 | 6 | 3 | 3 | 3 |
| | 59, 60 | 4 | 2582·6 | 645·7 | 2 | 8 | 2 | 4 | 4 |
| | 23 | 12 | 10372·6 | 864·4 | 1 | 12 | 9 | 9 | 3 |
| | 24 | 14 | 14175·0 | 1012·6 | 1 | 14 | 12 | 12 | 2 |
| Second Floor | 33 to 37<br>41 to 45 | 6 | 4637·2 | 772·10 | 10 | 60 | 4 | 40 | 20 |
| | 39, 40 | 6 | 4756·9 | 792·9 | 2 | 12 | 4 | 8 | 4 |
| | 38 | 10 | 6545·0 | 654·6 | 1 | 10 | 5 | 5 | 5 |
| | 48 to 56 | 6 | 4752·0 | 792·0 | 9 | 54 | 4 | 36 | 18 |
| | 63, 64, 67, 70, 71, 72 | 6 | 5316·9 | 886·1 | 6 | 36 | 4 | 24 | 12 |
| | 68, 69 | 6 | 3871·0 | 645·2 | 2 | 12 | 3 | 6 | 6 |
| | 65, 66 | 4 | 2777·4 | 694·4 | 2 | 8 | 2 | 4 | 4 |
| | 46 | 12 | 10756·8 | 896·4 | 1 | 12 | 9 | 9 | 3 |
| | 47 | 14 | 14700·0 | 1050·0 | 1 | 14 | 13 | 13 | 1 |
| | | — | — | — | 72 | 470 | — | 304 | 166 |

This table shows that there is space for no more than 304 beds, instead of for 470, the present number, so that there are 166 more beds in the hospital than there should be.

The basement of the building is not well lighted. It is appropriated to stores, itch and small-pox wards, baths, and other offices.

Although the hospital is constructed for 470 beds, under the present regulation as to space there were, at the time of our visit, 529 patients requiring treatment, and there was great overcrowding in consequence.

The ventilation is very insufficient; it is effected by a moveable fanlight over the doors of most of the wards, by windows in others, opening into the corridor; each ward generally has one window to the outer air opposite the door, and two air-brick openings near the ceiling.

The corridors, lobbies, and staircases all require ventilation; in the former by shafts and inlets, the latter by ventilators in the skylights.

The wards mostly are constructed for six patients, but there are others for 10 and 14 sick. Nearly all the wards are deficient in light and window space.

There are two bath-houses with a plunge bath in each; hot water is supplied to one of them only, for itch patients. A boiler is required for the other bath-room. Slipper-baths, with hot water from the kitchen, are the only means of supplying the other patients with bathing accommodation. Baths and lavatories, with hot and cold water, are required on each flat.

There are two sinks lined with lead, and supplied with water in each corridor, but there are no proper sculleries or nurses' rooms.

These sinks at present are the only means for ablution for the sick, there being no room or other convenience for this purpose in any part of the hospital.

There are self-acting water-closets and urinals opening out of every corridor, in buildings projecting beyond the body of the hospital; they are ventilated, and do not appear to give rise to smell.

The kitchens are large and convenient, and are supplied with boilers, ovens, and hot plates.

There is no laundry. The pack store consists of three dark rooms in the basement.

The washing is done out of the hospital.

The linen store is too small.

There is no drying apparatus, or room for airing linen, an essential convenience in all hospitals.

The room for the hospital guard is inconveniently placed within the building, and adjoining the wards appropriated to sick prisoners. These wards are low, dark, imperfectly ventilated, and very unsuitable for the reception of sick men.

A guard-room outside near to the entrance has been proposed, and more suitable sick accommodation for prisoners is certainly required.

We are decidedly of opinion that none of the basement wards facing the north are fit for this purpose at all. The wards facing the south are somewhat better, and might be used for the present; but they ought not to be occupied for sick longer than is necessary to provide other accommodation.

Gas is used in the passages, but the lights are stated to be insufficient, and the wards are very inadequately lit by tallow candles. It would be a great improvement to introduce a properly ventilated gas burner into each ward.

The drainage and water supply are stated to be sufficient.

Most part of this hospital is old, the site objectionable, and the accommodation for the increasing strength of the garrison insufficient. It is also wanting in several necessary conveniences which could not be supplied without further encumbering an already circumscribed site, which affords, at present, only two small yards for exercise, or by reducing the present inadequate accommodation for the sick, by misappropriating sick wards for the purpose.

It will be seen from the table already given that the regulation cubic space for sick is too small, and that in all the wards a large reduction of numbers will be necessary.

All the wards require ventilation by means of shafts led up from the angles of the ceilings through the roof, giving an area of 12 superficial inches of ventilating space per man for the lower rooms, and 14 square inches per man for the upper rooms.

Inlets for air should also be provided from the outer air, giving about 10 square inches per man of opening; the air to be diffused by means of perforated zinc or wire gauze. The ventilators must be capable of being opened or closed as required by the medical officer, and of being locked in the position he determines to be most desirable.

There should also be an arrangement for admitting air into the passages so as to be warmed by a stove, or behind the fireplace in a chamber of fire brick, from which it would pass into the passage, and from thence into the wards by inlets to be *always* open. This supply of air should be resorted to when the weather is too cold to allow of its being admitted direct from the outer air.

In the wards for convalescents the windows do not open at top; this defect should be remedied.

There are privies and urinals out of doors adjoining the exercising ground behind the hospital, which are in a disgraceful condition. Although a flushing apparatus has been provided, it appears never to have been used.

Improved water latrines with water tanks, divisions of seats, half doors and proper ventilation, are required, and urinals with slate divisions, and provided with water, should also be erected.

There is no day-room for convalescents.

The position, construction, and accommodation for sick in this hospital are all defective, and it is in great need of internal painting, whitewashing, and cleansing.

We are glad to learn that the question has been entertained of providing another hospital for this large and increasing garrison. It would be less expensive to do so than to make the extensive alterations required to render the present building suitable for sick.

A more airy and better site, sufficiently near the barracks for such a building, has been proposed; and in our opinion the best arrangement would be to erect a new hospital of proper construction and to convert the existing hospital into additional barrack accommodation for the growing requirements of the royal artillery. If this course were adopted, it would be necessary to increase the light in many of the rooms by opening additional window space.

The site alluded to for a new hospital is near the quarters of the Commanding Royal Engineer, and would form a good site for this purpose if sufficient in area.

In the event of the subject being further considered, we should be glad to lend our aid respecting the plans. In the meantime we should recommend the following improvements to be carried out in the hospital in order to meet the more immediate requirements for health.

1. Ventilation of all the corridors, passages, staircases and wards, in the manner pointed out. These improvements would be equally available if the building should be eventually turned into a barrack. Two additional windows to be made for each of the large end wards. A ventilated gas burner to be introduced into each ward.

2. Reduction of numbers of sick to the extent pointed out in the preceding table, and the provision of temporary hospital accommodation to supply the deficiency.

3. Making the windows in the convalescent wards to open at top.

4. Accommodation for sick prisoners to be restricted to wards facing the south.

5. Better lavatory and bath accommodation near the wards, by appropriating a small ward on each flat for the purpose.

6. Privies in the court behind the hospital to be converted into water latrines with suitable means of flushing.

In this hospital the very objectional custom prevails of the orderlies sleeping in the wards with the sick. It would be very advisable to make some arrangements by which this could be avoided, if practicable.

We have the honour to be, &c.

SIDNEY HERBERT.
JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission.*

*October* 4, 1858.

# CHATHAM DISTRICT.

Sir,

In compliance with our instructions, we have the honour to transmit the following Interim Report on the barracks and hospitals at Chatham and Brompton:

We have examined and inquired into the sanitary condition of the following barracks and hospitals at this station, and shall report on them separately:—

1. Chatham Barracks.
2. Spur.
3. Chatham Garrison Hospital.
4. Fort Pitt (Upper) Hospital.
5. „ Casemated Hospital.
6. „ Lunatic Hospital.
7. Brompton Barracks.
8. „ Hut Barracks.
9. St. Mary's Casemates.

## 1. CHATHAM BARRACKS.

These barracks, which occupy an area of about 12 acres, are situated on the slope of a hill, at some elevation above the river Medway. Their position generally is open and airy, and there is no local peculiarity in the site which ought to render it unhealthy.

The soldiers' barracks occupy the lower part of the hill-side. Above them is the parade ground, and higher than the parade ground are the officers' quarters.

The barracks are built in three parallel lines of blocks, running across the slope at right angles to its plane. Each line is about 30 feet from the line of building next below it. The front of each block looks upwards to the hill, and on account of the fall of the ground, the buildings are higher on their lower than on their upper side, a circumstance which renders the lower rooms in all the blocks unfit for being used as barrack-rooms. They are dark and damp, and in the two front ranges they are used for lavatories.

Each floor of every block of buildings contains two ranges of barrack-rooms built back to back, so that the rooms have windows only on one side; a thorough draft of air, so essential where rooms are crowded with men, is usually sought for, in barracks of this construction, by providing openings through the partitions dividing the two rows of rooms, but such an arrangement simply admits the foul air of one room to intermingle with the foul air of another room, without ensuring any corresponding advantage from the windows on the opposite sides of the building.

The access to the rooms is by wooden staircases and wooden landings, running the entire height of the blocks, with windows back and front. There are, in all, 176 barrack-rooms, with regulation accommodation for 2,700 men.

The dimensions of these rooms are very similar in the great majority of instances. 146 rooms are 27 feet 9 inches long by 19 feet 3 inches broad, and they vary in height from 8 feet 3 inches to 10 feet 4 inches. They are, for the most part, gloomy, dark, low, and encumbered with clumsy hanging shelves, which interfere with the circulation of air in the rooms.

Nearly all the rooms have three windows on one side, varying in height from 3 feet 5 inches to 4 feet 6 inches, and 2 feet 10 inches broad. In most cases this window space is insufficient.

Each room has a fire-place opposite the door. The chimney breast is generally 4 feet 3 inches above the floor, and about 4 feet wide. These fire-places are not well constructed, and the grates of some of them waste a large amount of heat.

The rooms are very much overcrowded.

In six rooms the number of men allotted by regulation gives only 294 cubic feet per man.

| | | | | |
|---|---|---|---|---|
| In | 3 | it is | 358 cubic feet | „ |
| „ | 56 | „ | 345 „ | „ |
| „ | 54 | „ | 281 feet | „ |
| „ | 20 | „ | 275 cubic feet | „ |
| In | 16 | it is | 285 feet per man. | |
| „ | 8 | „ | 247 „ | „ |
| „ | 3 | „ | 364 „ | „ |
| „ | 4 | „ | 325 „ | „ |
| „ | 3 | „ | 383 „ | „ |

In 3 rooms only does the space per man exceed 500 cubic feet, and these 3 rooms accommodate no more than 6 men.

The following table shows at one view the practical result of this overcrowding, as it affects the amount of barrack accommodation that would be at once required to enable us to set aside 600 cubic feet per man as recommended by the Royal Commission, and required by our instructions:—

| Number of Rooms. | Men accommodated according to present Regulation. | Men to be accommodated at 600 Cubic Feet each. | Number of Men for whom Accommodation is deficient. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 6 | 102 | 48 | 54 | 17 | 8 |
| 3 | 51 | 30 | 21 | 17 | 10 |
| 56 | 896 | 504 | 392 | 16 | 9 |
| 54 | 864 | 378 | 486 | 16 | 7 |
| 20 | 320 | 140 | 180 | 16 | 7 |
| 16 | 256 | 128 | 128 | 16 | 8 |
| 8 | 104 | 40 | 64 | 13 | 5 |
| 3 | 30 | 18 | 12 | 10 | 6 |
| 4 | 40 | 24 | 16 | 10 | 6 |
| 3 | 27 | 18 | 9 | 9 | 6 |
| 2 | 8 | 6 | 2 | 4 | 3 |
| 1 | 2 | 2 | — | 2 | 2 |
| 176 | 2,700 | 1,336 | 1,364 | — | — |

It hence appears that there is a deficiency of accommodation in Chatham barracks of upwards of 50 per cent.; so that the buildings would require to be doubled to hold the present number of men in them with security to health.

This great overcrowding is not compensated for either by the structure or ventilation of the buildings, and we are of opinion that nothing except the high exposed position of these barracks, and the comparatively short sojourn of the troops in them, preserves them from epidemic disease.*

There being no accommodation for staff-serjeants, or for the offices of so large an establishment, soldiers' barrack-rooms are misappropriated for these purposes, and the limited barrack accommodation is further reduced from this cause.

Every room was occupied at the time of our inspection at an average of 351 cubic feet per man, and a large number of recruits were daily expected, for whom space would have to be obtained in the same rooms.

The ventilating arrangements of the barrack-rooms are very defective. They consist of a sloping board inserted near the top of each window, leaving a space between the upper surface of the board and the lintel through which air can pass into the room when the window is drawn down at top. There is also a slide in the door that can be used to admit air from the staircases, and air is allowed to enter under the floor joists at the foot of the centre wall.

All the ventilating openings, except the last, are under the control of the men, who keep them closed when they most need being open, so that, in reality, the only means of ventilating these overcrowded rooms is by the fire-places.

All the barrack-rooms are lit with gas which is described to be a great comfort to the men; but it is not economical, on account mainly of wastage from the pipes, both above and below ground, and partly from want of care in the consumption. There are no means of removing the products of combustion of the gas from the atmosphere of the rooms.

* We are informed that scalet fever has broken out in these barracks since our inspection.

There is no day-room attached to these barracks. The men occupy the crowded sleeping rooms during the day, and they also take their meals in them. There is little chance of the rooms being thoroughly purified so long as these practices are allowed to continue. The walls and ceilings bear marks of want of due cleanliness. This appears to arise from no neglect of the barrack officers, but simply from the fact that proper purification of buildings occupied in the way these barracks are occupied is next to impossible.

The floors of a number of barrack-rooms are covered with asphalte, which is an objectionable material from being cold, and from retaining moisture on its surface.

There are day and infant schools, the former having accommodation for 550 scholars, a number which exceeds considerably the attendants.

There is a library and reading-room, containing 3,112 volumes. The privileges of this room are highly prized by the soldiers. During last year there were 5,776 subscribers. The room is about 40 feet long, 22 feet broad, and 11 feet high, showing, an amount of accommodation quite inadequate to the wants of the readers.

As already stated, the lavatories are placed in the ground floors of the two front ranges of buildings. They are 11 in number, each fitted up with 40 basins, and having water laid on. These rooms are only 7 feet 2 inches high; they are gloomy, damp, cold, not well ventilated, and certainly not suitable places for men to go and wash in immediately after leaving their beds. There is indeed one very good ablution-room belonging to the barracks; but as there is no proper meat store for issuing some 3,000 rations a-day, this room has been appropriated for the purpose. Each lavatory has a small bath, but there are no means of obtaining hot water for it, and the bath accommodation generally is inadequate for the purposes of cleanliness and health. There are no lavatories or baths for the women and children in the barracks.

The washing establishment at Chatham barracks is wholly inadequate for the requirements of so many officers and men.

The reconstruction of the laundry, with the now generally used improvements of steam, hot water, &c., has been recommended by the Commanding Royal Engineer, and ought to be done without delay. From the constant passage of men through the garrison, and the consequent large quantity of fresh and of new clothing and bedding issued to the troops, perhaps in a damp or imperfectly dried state, no station which we have visited requires a drying-room more than this.

Chatham barracks contain no separate accommodation for married non-commissioned officers, or for soldiers whose wives are allowed. Staff-serjeants have separate rooms, and pay-serjeants have either a room to themselves or a room between two. But in every barrack-room there is a married non-commissioned officer or private among 14 men, and not unfrequently girls from 14 to 16 years of age are inmates of barrack-rooms, mixed up with the soldiers.

Apart from the demoralizing tendency of such arrangements, the atmosphere of barrack-rooms is liable to deterioration from the occupations carried on by married people during the absence of the men for parade or other duties. Advantage is commonly taken of this by the women for unsavoury cooking, for washing, and for getting up linen. During these operations the doors and windows are diligently closed. The walls become impregnated with impurities from this source, and damp from wet or imperfectly dried linen being secreted until opportunity offer of getting it out of hand. Hence it arises that the soldier not unfrequently returns to a close, heated, and often noisome atmosphere, in which he probably passes the night. Nor is this all; curtains, double beds, accumulated clothes, and cooking utensils, perhaps children, further crowd the room, and deprive the others of their fair share of space and ventilation. The only remedy for an evil of such magnitude is to provide suitable married quarters, and to remove the women and children out of the barrack-rooms.

In 1856–57 a sum of money for erecting a block of buildings for married quarters was authorized, but as there was a difficulty about the site, the money was expended on a similar object at Brompton barracks. His Royal Highness the Commander-in-Chief has pointed out a site, but there are at present no funds for the building.

Until the end of last year the whole cooking in Chatham barracks was done in four kitchens, containing 56 boilers for making soup. The soldiers had been in the habit of sending their meat two or three days in each week into the town of Brompton to be baked, and for this change in cooking they voluntarily incurred an expense of 200*l.* per annum. About the beginning of the present year a suitable building with two large ovens was completed and is now in use.

Although these ovens do not afford all the improvements in cooking that might be desired, they are a very great convenience to the men.

There are no cleaning-rooms belonging to Chatham barracks; there are no covered sheds for drill, and the want of this accommodation is much felt. All the guards for Chatham garrison are paraded at the barracks, and recruits are being constantly drilled, in all states of the weather. When rains falls the men have to seek shelter where they can obtain it. The want of a suitable shed has been represented from year to year without result. But apart from duties and exercise, cover of this kind is required for the frequent filling of palliasses, which, in the constant movement of the troops, cannot wait for fine weather.

There are three tailors' shops belonging to the barracks. There is no available space for the erection of additional workshops, in which the soldiers' spare hours might be spent, although there are premises now otherwise occupied, which could be converted into suitable workshops if they could be spared.

The water supply for the barracks is derived mainly from the dockyard, whence it is pumped up by an engine to a tank above the level of the barracks.

The supply is insufficient for some most important purposes, as for instance, for flushing out privies, urinals, and drains. An additional supply is required, and could be obtained either from the dockyard, or by laying on water from the Water Company's works at hand.

The rapid fall of the ground towards the Medway affords great facilities for draining all the buildings. There are trapped sewers which descend the hill, and empty themselves into the river above low-water mark, and part of the drainage of the buildings is passed into these sewers; but there are cesspools in front of the blocks occupied by soldiers, in the second and rear ranges, which ought to be at once abolished, and the whole drainage improved.

The surface drainage between the blocks is not in very good condition, and the open gutters running along under the barrack-room windows are used for emptying the urine tubs. The latrines generally are defective in construction, and the water supply is too limited to admit of their being sufficiently flushed.

The urinals, especially those near the guard-rooms, are not in good condition, and require a supply of water to keep them clean.

The ash-pits are open and exposed, and apt to generate nuisances. Provision could easily be made for their abolition by collecting and removing the barrack refuse every day in suitable iron carts, one of which might be left for receiving the refuse of the day, removed when full, and replaced by an empty cart.

There is no proper accommodation for the dirty bedding or dirty hair stores, which are at present placed under the men's sleeping rooms, in two of the barrack buildings.

There are no drying-rooms for airing or drying the men's personal linen or bedding in damp weather. The beds and bedding are changed in certain days of the week without reference to the state of the weather, and to these defects the medical officer attributes much of the catarrhal and pulmonary disease prevalent in the barracks.

The ventilation in all the guard-rooms and lock-up places is defective, and there is a considerable degree of overcrowding in the latter. We are informed that when the lock-up rooms happen to be crowded with prisoners, the men break every pane of glass in them, in order to obtain air.

*The Main Guard* (men's room), is intended to contain 30 men under the regulations, a number which would allow only 175 cubic feet of space for each. It was occupied at the time of our inspection by 21 men, giving less than 250 cubic feet to each.

The officer's room attached to the main guard gives 1,627 cubic feet to its one inmate.

*Brompton Gate guard-room* contains, according to regulation, 16 men in a space giving 282 cubic feet per man. It was occupied when we inspected it by 11 men, at about 410 cubic feet each. The adjoining officer's room gives 1,848 cubic feet to its occupant.

*The Regimental guard-room* holds 10 men at 410 cubic feet each. At the time of our inspection it was occupied by eight men, at 513 cubic feet each.

The regulation number that can be placed in the lock-up rooms, if these rooms were fully occupied, would overcrowd them to a great degree.

*The Old Provost lock-up* is intended for 20 men, at 210 cubic feet each.

*The Main Guard lock-up* for 8 men, at 169 cubic feet each.

*The Brompton Gate guard lock-up* ought to contain 8 men according to regulation, at 169 cubic feet each.

*The Regimental lock-up*, No. 1, is intended for 20 men, at 287 cubic feet for each. Lock-up No. 2 is for the same number of men, with a similar amount of cubic space.

The cubic space in the prison cells is very much larger than in the lock-up rooms.

*The Old Provost cells* give 660 cubic feet for each prisoner.

*The Regimental cells* give 500 cubic feet per prisoner; but the 14 new provost cells give no less than 1,482 cubic feet per man.

On comparing these amounts with the cubic space given either in the barracks, hospital, or guard-rooms of Chatham garrison, we cannot but be impressed with the great advance which has taken place in improving the sanitary state of prisons when compared with the present accommodation of the soldier any where outside the prison walls.

The main evils in Chatham barracks are overcrowding and defective ventilation.

The lofty and exposed situation of the garrison, and the absence of those external impediments to a free circulation of air, which usually exist in town barracks, no doubt materially diminish the effect of the unfavourable circumstances mentioned on health. Most of the soldiers, moreover, are recruits, and do not remain above a few weeks in the barracks. The mortality, therefore, is by no means high, although the admissions into hospital are numerous, and the diseases which prove fatal already begin to indicate the influence of barrack life on the soldiers' health, by their greater proportionate mortality than among the class from which the soldier comes.

The average monthly strength for six years and eight months, from April 1st, 1851 to November 30th, 1857 was 2,810 men.

The admissions into hospital during the same period were 26,837, or in the ratio of 1,400 per 1,000 of the strength per annum.

There were 192 deaths during the same period being at the rate of 10·2 per 1,000 per annum.

The mortality of males in civil life between the ages of 15 and 25 is 8·1 per 1,000 per annum, showing an increase of mortality of above 2 per 1,000 per annum among the recruits.

About 9 per cent. of the admissions into hospital have been from fevers, cholera, dysentery, and diarrhœa; and about 23 per cent. of the deaths have been occasioned by these diseases.

Upwards of 43 per cent. of the mortality has arisen from phthisis. The proportionate mortality from this disease among males in civil life between the ages of 15 and 25, being 39·8 per cent. of the total mortality.

Catarrhal, pulmonary, and zymotic diseases are the chief causes of sickness in Chatham garrison; and out of 192 deaths within the period mentioned above, 127, or 66 per cent. were occasioned by phthisis, fever, cholera, dysentery, and diarrhœa; but, as already stated, the absolute mortality, and the relative mortality from these diseases, which are intimately connected with defective sanitary condition, would, in all probability, be much higher were it not for the airy position of the garrison.

As it is, the prevalence of those diseases from which the mortality mainly arises, indicates the extent to which the natural advantages of the situation are neutralized by want of regard to hygiène.

*The following are the requirements for Health for Chatham Barracks:—*

1. Reduction of numbers in every barrack-room, to give each man 600 cubic feet of space.
2. Ventilation of every barrack-room by a shaft carried up from the corner of the room opposite the windows to the roof, and admission of fresh air by means of a perforated wire gauze cornice between the windows.
3. Similar means of ventilation for the guard-rooms, lock-up rooms, schools, and library.
4. Reducing the numbers in the guard-rooms, so that every man *constantly* in the room shall have 600 cubic feet of space.
5. Reducing the numbers on the schedule of the lock-up rooms from its present amount to the numbers usually in these rooms.
6. Limewashing the walls and ceilings of all barrack-rooms twice a year.
7. Boarding the asphalted floors.
8. Abolishing of cesspools and improving the drainage.
9. Additional water supply.
10. Reconstruction of latrines throughout the garrison with water receptacles, and suitable means of efficient flushing; and division of seats.
11. Urinals to be reconstructed and supplied with water.
12. Removal of foul bedding and hair stores from under barrack-rooms.
13. Better ablution-rooms to be provided for the men, and also for women and children.
14. Baths to be provided in the proportion of one bath to every 100 men.
15. Proper urinals to be provided for the barrack rooms instead of urine tubs.
16. Provision to be made by iron carts, one of which is left at the barrack while the other is being removed, for the daily collection and removal of all barrack refuse; abolition of ashpits.
17. A drying-room, with stoves for drying and airing men's linen, bedding, &c. to be provided.
18. Day-rooms to be provided, and suitable accommodation in the way of workshops.
19. Covered sheds for drill.
20. Reconstruction of laundry, with suitable means for washing and drying clothes, and bedding.
21. Construction of married soldiers' quarters.

With respect to the last of these requirements, we may add that the officers' quarters are of a very inferior description; the rooms are small, badly arranged, and unsuitable. They could be readily altered and improved in their sanitary condition and structure to render them fit for married soldiers' quarters, in which case new officers' quarters would have to be constructed.

## 2. SPUR BATTERY.

The barrack accommodation at Spur battery consists of 12 rooms, with regulation accommodation for 42 men, to which extent the rooms were occupied at the time of our inspection.

In two rooms there were eight men in each, with 412 cubic feet per man; these rooms would hardly contain six men in each at 600 cubic feet per man.

In one room there were six men where no more than five ought to be.

In one room there were six men where only four ought to be.

In two rooms there were four men in each in the cubic space for two men.

The upper casemated rooms are appropriated for invalided gunners or married soldiers; while the lower rooms, being considered ineligible for soldiers' quarters, are occupied by invalid soldiers and their families, or by married soldiers belonging to Chatham garrison.

There are no means of ventilation for any of the rooms except windows, doors, and chimneys.

There is one kitchen, with no means of cooking except by boilers.

The water is derived from a well.

The drainage is defective: it is merely led outside the works and there discharged.

The latrines are in bad condition.

Although these buildings have been for some time disused as barracks, they are still occupied by soldiers and by invalids, and any cause of unhealthiness in them will be prejudicial to both classes of men, especially to the latter.

The only thing that could be done with them, if they are to be continued in occupation, would be to improve the ventilation, drainage, &c., and to remove the invalids from them as soon as other accommodation can be provided.

It would be far better, however, to evacuate the buildings altogether on account of their general unfitness for human habitation, and to appropriate them as stores; and this latter course we would recommend as the least expensive to the public.

### 3. CHATHAM GARRISON HOSPITAL.

This hospital, originally constructed for the sick of the ordnance, has had several considerable additions made to its accommodation since its conversion to its present use. It now consists of two buildings, Nos. 1 and 2, situated in an open airy position, on the hill slope above the barracks. The main line of building faces east and west, and on each floor there is a range of wards and a corridor extending the entire length of the range. The wards are situated on the eastern side, and the corridor on the western side. The milder and warmer aspect of the hospital is thus protected by the corridors, whilst the colder side has no protection. The ranges of corridors communicate by stairs extending from the top to the bottom of the building, so that the entire ventilation of the hospital wards is common throughout.

There are 37 sick wards, exclusive of two for the separate treatment of itch patients.

The following table shows the extent of ward accommodation in this hospital:—

| Wards. | Present Number of Beds. | Number of Beds at 1200 Cubic Feet each. | Deficiency of Bed Space. |
|---|---|---|---|
| No. 1 Hospital. | | | |
| 1, 2, 3, 4, 8, 9, 10 | 42 | 21 | 21 |
| 13 to 32 inclusive | 200 | 100 | 100 |
| 33 to 37 inclusive | 30 | 15 | 15 |
| No. 2 Hospital | | | |
| 1 to 6 inclusive - | 60 | 36 | 24 |
| Total 38 | 332 | 172 | 160 |

The wards are low and confined. With six exceptions, they are only 10 feet 8 inches in height, and the remaining six wards are 12 feet high. Their length varies from 18 to 33 feet, and their breadth from 16 feet 6 inches to 19 feet 10 inches. All the wards in No. 1 hospital have only one window each, varying from 4 feet 6 inches to 6 feet 8 inches high. The six wards in No. 2 hospital have two windows in each. The whole structure resembles a series of cells, presenting great obstacles to ventilation, and the foul air of which can pass from one cell to the other by means of the corridors and staircases.

The ventilation, such as it is, is effected by two openings into the external air on the eastern side of each ward, and two openings into the corridor In all the wards except five, there is also a swing window over the door opening into the corridor.

Including 30 itch beds, there are 358 beds in these buildings, and each bed has, on an average, 596 cubic feet of space. In 12 wards the cubic space averages 527 feet per bed. In 20 wards there are 642½ cubic feet per bed, and in six wards the space amounts to 690 cubic feet per bed.

There is one fire-place and one gas-light for each ward, and there are three gas-lights in each corridor.

There are two lavatories, one for each building, but the lavatory accommodation is very deficient.

There are three bath-rooms, one of which belongs to the itch wards.

The bathing accommodation is deficient.

There is no laundry.

Each building has a cook-house, but the kitchen arrangements are very imperfect, and require reconstruction.

The provision store is too small. A store is required for soiled bedding, and also a medical store-room.

There is no suitable hospital accommodation for sick officers, for staff non-commissioned officers, or for women and children.

There is no room for divine service, and there is no waiting or reading-room for medical officers attached to the hospital.

The water supply is pumped up from the dockyard, and when any accident happens to the machinery, the hospital is frequently short of water.

The water-closets were being reconstructed on better principles at the time we inspected the buildings, but some were still very defective. The privies in the centre block had no water laid on, and were very offensive.

There are no urinals.

The enumeration of defects we have given will be sufficient to show the exceedingly defective plan on which this hospital has been built, and the want of knowledge it displays of the true principles of hospital construction. It cannot, except at very great expense, be so altered as to make it embody the present knowledge on the subject. All we should advise would be to remove the more obvious sanitary defects. Under any circumstances, it will be difficult to ventilate the wards satisfactorily, for the sick are ranged along the dead walls, instead of between the windows, so that the emanations from the sick must pass over all the beds before escaping either into the open air or into the corridors.

The very first improvement required, is reducing the number of sick, so as to allow, as nearly as may be, 1,200 cubic feet per bed. To effect this, it will be necesary to reduce the number of beds in wards 1, 2, 3, 4, 8, 9, and 10, in No. 1 hospital, from six to three in each ward, which would give 1,054 cubic feet per bed. To do this, 21 beds out of 42 in these seven wards will have to be removed.

In each of the wards 13 to 32, we would propose to place five beds instead of 10, the present number. This would give 1,284 cubic feet per bed. These 20 wards contain 200 beds, 100 of which will require to be removed.

Wards 33 to 37 have six beds in each, half of which we propose to remove, which would give 1,054 cubic feet each for the three remaining beds. Fifteen beds would have to be removed from these five wards.

In hospital No. 2 are six wards, 1 to 6, each containing 10 beds. by removing four beds from each ward, each of the remaining six beds would have 1,150 cubic feet of space. To effect this improvement 24 beds will have to be removed. The deficit of accommodation for sick in this hospital amounts on the present number to 160 beds, which, if removed, would give the remaining 172 beds (excluding the itch wards) 1,206 cubic feet of space on an average.

Besides the improvements more immediately required in Chatham Garrison hospital, it would be advantageous to the external circulation of air to remove a one-story building in the yard ; to convert the present guard-room into a dirty bedding store, and to provide another guard-room at the entrance gate. A larger and better lighted inspection room and dead house are required, and it would be an additional improvement to extend the hospital grounds by including in them the carriage way in the rear.

*The following are the Requirements for Health :—*

1. Reducing the number of beds as already stated.
2. Separate ventilation for every ward by a shaft carried up from the ceiling to the roof of the building, and by admitting fresh air by the existing ventilators, through partial cornices of perforated zinc, or wire gauze. The corridors also require ventilation.
3. Abolishing privies and imperfect water-closets, and reconstructing all water-closets efficiently.
4. Construction of urinals beside the water-closets.
5. Increased water supply.
6. Reconstruction of hospital kitchens, with the requisite means of cooking diets.
7. Construction of lavatories and bath-rooms for each division of the hospital.
8. A day and dining room to be provided for convalescents.
9. A covered walk or exercising ground for convalescents.

These requirements are in our opinion barely sufficient to remove the more obvious sanitary defects in Chatham Garrison hospital ; but, even if they were all carried out, the building would be by no means what it ought to be as a garrison hospital, where junior medical officers are expected to acquire a knowledge of the specialities of their department. The other desiderata enumerated equally require to be supplied.

## 4. FORT PITT (UPPER HOSPITAL).

This hospital consists of four blocks of wards, arranged in two lines, running from north-east to south-west. The blocks are 18 feet apart from each other, and the space between them in the middle is occupied by buildings, so that the whole hospital has the form of the letter H. On either side of this middle line of buildings is a small rectangular court, not open, but built across on the north-east side by structures connected with the hospital, and on the south-west side by a wall. The space between the blocks of wards, instead of being left open for thorough ventilation, is thus converted into two closed courts. The court, on the north-east side, is occupied by lavatories, baths, water-closets, and covered passages, leaving only a small square yard in the centre. The south-west court contains in its centre a large cesspool, which has not been emptied within the memory of anyone in the hospital. At one end of this court are the water-closets, which are drained into this cesspool, and at the other end are some very offensive open privies.

The hospital occupies high ground within the lines of Fort Pitt, on an area of about three acres. The ditches are deep, and there are no drainage outlets from the interior of the fort, so that all the filth and drainage of the establishment, except what is carted away at distant intervals from the privies, is allowed to percolate into the chalk.

The wards are arranged in pavilions, or blocks joined end to end, and have windows along the two opposite sides.

There are eight wards, each 59 feet long, and 22 feet 9 inches broad ; they are of different heights, four being 13 feet 8 inches high, and four 12 feet 8 inches high.

One ward is 23 feet 6 inches long, 19 feet 3 inches wide, and 12 feet 8 inches high. One ward is 34 feet 2 inches long, 24 feet 2 inches broad, and 9 feet 9 inches high ; and two wards are each 14 feet 10 inches by 13 feet 9 inches, and 12 feet 8 inches high. These two latter wards are only occupied in cases of emergency, and are used for patients requiring separation.

The eight larger wards have each nine windows ; the sills of these windows are 5 feet 2 inches from the ground, and the windows open at top only.

The two smaller wards have, one five and the other two windows, opening at top and bottom. The windows are some seven some eight feet high. Each of the larger wards has a fire-place at either end, and the smaller wards have one fire-place each.

In each of the eight larger wards are 27 beds, 25 for sick, and two for orderlies, arranged on opposite sides of the wards, between and under the windows. The beds are only 20 inches apart, and 9 feet 1 inch from foot to foot. The cubic space per bed in the four loftier wards is 678 feet, while in the other four wards it is 629 cubic feet.

The two smaller wards accommodate, one nine, the other 16 sick, with a cubic space per bed varying from 503 to 636 feet.

The following table shows the present ward accommodation at Fort Pitt hospital, in comparison with what it would be at 1,200 cubic feet per bed :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Space. | Present Number of Beds per Ward. | Proposed Number of Beds per Ward. |
|---|---|---|---|---|---|
| 2, 3, 6, 7 | 108 | 60 | 48 | 27 | 15 |
| 10,11,14, 15. | 108 | 56 | 52 | 27 | 14 |
| 12 - | 9 | 5 | 4 | 9 | 5 |
| 5 - - | 16 | 7 | 9 | 16 | 7 |
| Total 10 | 241 | 128 | 113 | — | — |

From the height of the ceilings of the wards, sufficient ventilation might be effected by open windows and fire-places, provided each bed had 1,200 cubic feet of space, and there are besides ventilating openings in the ceiling of each ward, covered by plates with a few round holes bored in them, communicating with the external air by hollow beams above the ceiling. In four wards there are 12 of these openings in the ceilings. In other four wards there are four each, and in each of the two smaller wards there are three each. If the numbers of beds cannot be reduced so as to afford 1,200 cubic feet per bed, the wards must be ventilated by shafts and inlets in the usual way.

The hospital is lit by gas.

There is one lavatory, with slate tables and moveable zinc basins ; there are wooden gratings on the floor, and the room is well lighted. This lavatory can be reached from any part of the hospital under cover, but the distance from the more remote wards is too great. The structure of the lavatory is likewise much behind that of lavatories in more improved hospitals.

There are three fixed enamelled baths with hot and cold water laid on, connected with the lavatory. There are two coppers, each capable of heating water for seven baths. There is also a shower bath. These bath arrangements are much better than those in any other military hospital we have yet examined, but they are too far from the sick wards.

The laundry is used for washing personal linen, flannels, and table cloths, and for such purposes it appears to be sufficient.

The kitchen has not sufficient means for cooking hospital diets. There are boilers for boiling, stewing, and preparing hot water for tea; there is also an oven and an ordinary kitchen range, but a proper roasting apparatus is required.

Water is derived from a deep well. The water is hard but otherwise good. It is raised by an antiquated pumping apparatus driven by a horse, apt to get out of order, and, when this happens, water has to be brought from Brompton, two miles distant in water carts, in which case 20 carts full are daily required for the consumption of the hospital.

As already stated, Fort Pitt is not sewered, it has only surface drains.

The provision stores are inconveniently situated, and one of them is so dark as to require gaslight in the daytime.

There is a good pack store.

The bedding store is in a damp casemate.

The dispensary is small, and situated close to a cesspool, the contents of which have saturated its walls.

There is no hospital accommodation for soldiers' families.

There is no day-room for convalescents.

The thing most to be commended in Fort Pitt hospital is the plan of block construction, with the windows on both sides, but except in the adoption of this, the only admissible plan of hospital construction, the buildings are not well adapted for hospital purposes.

The wards might be higher with advantage, the blocks are too close together, the painting defective, the beds too crowded; the water-closets are not well situated; there are several large cesspools and offensive privies close to the sick wards.

The additions to the building have been made without any apparent consideration as to what was likely to be their effect on the health of the building. There is a very offensive privy close to the kitchen. The kitchen arrangements are defective, as are also those of the lavatories.

Several of these defects are more or less counterbalanced by the high exposed situation of the hospital, which renders the building more healthy than it would otherwise be.

*The following Measures appear to us to be necessary for improving Fort Pitt Upper Hospital:—*

1. Diminution of overcrowding, by setting apart 1,200 cubic feet to each patient. This can be done in wards 2, 3, 6, 7, by reducing the number of beds from 27 to 15; and in doing this care should be taken that no bed is placed under a window.

In wards 10, 11, 14, 15, the number will have to be reduced from 27 to 14 in each ward.

In ward No. 12, the beds will have to be reduced from 9 to 5.

In ward No. 5 the numbers must be reduced from 16 to 7.

The total available accommodation in this hospital will contain 128 sick and no more, and to do this the orderlies must be removed out of the wards. It is as contrary to sound principles of administration and discipline as it is certainly contrary to the principles of humanity, that orderlies should sleep among the sick. They should never enter the wards for any other purpose than the performance of their duties, and to enable this arrangement to be carried out, separate accommodation must be provided for them, both for sleeping and for taking meals.

2. If the proposed reduction of numbers be carried out, these wards may be ventilated both by day and night by a careful use of the windows; and if the air is ever impure, the blame must be attached to the person charged with the ventilation.

3. The next most important improvement required is sewering the whole of the buildings within Fort Pitt.

For this purpose suitable iron pipes might be carried across the ditches, and made to open into sewers conducted down the slope of the hill to the Medway.

4. As soon as the sewerage is completed, all cesspools and open privies must be abolished, and proper water-closets or water latrines for the officers of the establishment constructed in more suitable situations. Within the hospital precincts water-closets only should be permitted.

5. The present water-closets are situated in the very centre of the buildings, among the sick wards. It would be very desirable to remove them, and to construct new water-closets, with urinals and lavatories, and a bath-room at the far end of each ward. This would enable the existing lavatories, baths, and covered ways to be removed, so as to increase the circulation of air in one of the courts. In fact, all superfluous buildings, or walls interfering with the circulation of air between the blocks, should be removed.

6. Lavatories should be constructed of slabs of slate, with white earthenware basins sunk in them and water laid on, as in the hospital of the Scots Fusilier Guards.

7. The kitchen to be provided with a proper cooking range, and the boilers for making tea to be provided with taps to draw off the water. Tea in future not to be boiled, but infused in large teapots.

8. Improved pumping machinery to be provided for the water supply of the hospital.

9. Provision and bedding stores to be improved.

10. A day-room for convalescents and proper rooms for orderlies to be provided.

11. The woodwork of all the wards to be painted, and the walls and ceilings frequently limewashed.

12. There should be a suitable room set apart in each division for the medical officers.

These improvements, which are necessary for health and efficiency, could only be carried out at considerable cost, and after all the hospital itself, as has been shown, would only accommodate 128 sick. It might be extended to make the accommodation more commensurate with the requirements; but the question arises, whether, considering the local position of Fort Pitt, it is worth while to do so; or whether on the whole, it would not be better to build a more suitable hospital on a more convenient site, and deal with the present hospital merely as a subsidiary establishment. If it is to be continued these improvements ought to be carried into effect without delay.

## 5. CASEMATE HOSPITAL, FORT PITT.

This hospital consists of casemates sunk below the level of the ground on which the upper hospital is built. It is reached by descending flights of stairs. The casements open on the outer side to the external air on the hill sloping towards Chatham; and on the opposite side they open into the deep sunk area already mentioned. Six of them, A, B, C, D, F, G, are used for sick; two others, H and I, formerly used for sick, have been condemned as unfit for the purpose, and are occupied by orderlies and messengers, and one is occupied by the hospital serjeant in charge.

Each of the casemates used for sick is 60 feet long, 15 feet 9 inches wide, and 9 feet high. Each casemate has 5 windows situated at the two opposite ends, so that the distance between the windows is no less than 60 feet.

Each casement has one fireplace; but there are no ventilators in any of them.

They contain 24 beds each, with a space equal to 354 cubic feet per bed.

There are no water-closets attached to this hospital. There are very offensive privies situated on the basement, and only to be reached by passing from the sick wards into the open air, descending a flight of

steps, and traversing a cold, dark, underground gallery. The privies are not drained; they are mere cesspools, the solid contents of which are removed when the vaults are full, which is the case usually once a year. The operation of cleansing usually lasts a week, and the effluvia affects the entire atmosphere of the place. The ashpit is situated in the vicinity of the privies and close to the casemates.

The whole arrangements are as bad as it is possible to conceive.

It is not our intention to recommend any improvements in this hospital. It is perhaps one of the very worst places for the reception of sick in existence, and we would recommend its immediate evacuation. In fact, so bad is it, that the place should only be used for healthy men, under pressure of siege; but at no other time.

Until the middle of October 1847, accommodation was provided in these casemates for sick wives and children of soldiers, and for lying-in women. The accommodation was very defective; but such as it was it has been withdrawn, and the wards closed.

It has been elsewhere stated, that married men occupy barrack-rooms along with unmarried men, and the wives and children of these men have to be attended during sickness in the barrack-rooms, or elsewhere, and dieted at their own expense, except in special cases. There is no separate accommodation for lying-in-women, and there are from 150 to 200 confinements per annum in the garrison. Before the female hospital at Fort Pitt was closed, the admissions of women and children into it were never fewer than 200 per annum, besides about an equal number who were attended in barrack-rooms, and in different parts of Brompton and Chatham.

It appears to us that where a case of such necessity as this exists, there is a clear duty to provide the requisite hospital accommodation. It should certainly not be in Fort Pitt, nor in any other similar casemates; but a special hospital or division ought to be set apart without loss of time for this class of cases.

## 6. LUNATIC HOSPITAL, FORT PITT.

This building is of recent construction, and is rather intended for a house of detention or of observation than for an asylum. Patients are kept generally for a month or two, until their case is decided on, after which they are removed elsewhere if necessary. The building, therefore, should not be judged of as a regular lunatic establishment. The average inmates exceed 20. There are three flats of wards along each side of the building, with a corridor running from end to end, and having the ward doors opening out of it on either side. The corridors communicate by a staircase, which also affords a means of ventilation and light. Each corridor has two blind ends, in which are situated the water-closets, and the only means of ventilating and lighting these ends, is by opening the water closet doors and windows.

The wards and day-room are rather small, and have not that amount of cubic space per man required for the proper management of lunatics, while their small size, moreover, renders frequent entrance through the night necessary for supervision, and irritable patients are apt to be disturbed.

The general ventilation of the building requires improvement. Suggestions for this and for other improvements have been made by the medical officer from time to time, and most of them we understand to have been included in the estimates for the present year.

The fence surrounding the building is only 4½ feet high, and has been frequently cleared by patients at a bound. This defect might be easily remedied. Alterations might also be easily made in the water-closets at the end of the corridor, so as to enable light and air to enter the corridor without interfering with the closet.

## 7. BROMPTON BARRACKS.

These barracks are situated within the lines, and on the top of the hill behind the dockyard. The situation is open and airy. The buildings form three sides of a large square, open to the east. They cover about 11 acres of ground, and their general plan is such as to admit of a free circulation of air among the greater part at least of the ranges of building.

Their internal structure is not so good as the external arrangement of the blocks. The barrack-rooms are all built back to back, four rooms opening out of each passage, and having windows only on one side. They are intended to accommodate from 12 to 15 and 18 men each, and the whole barrack is fixed, by regulation, to hold 1,725 men.

There are two stories and a basement, and the rooms in the basement are partly used for barrack-rooms.

The rooms in the "South Square" are situated in a succession of small quadrangles. The floors are asphalted. A drain runs under this part of the building. The rooms are dark, and would be much improved by a wooden flooring over the asphalt, and by additional light and means of ventilation.

There are no privies or cook-houses attached to these quarters.

The engineer train occupy some new barracks, built in a square. The rooms are over the stables, an arrangement always to be avoided if possible, but otherwise the rooms are airy and light.

The following is the accommodation in Brompton barracks:—

| Barrack Rooms. | Number of Men according to Regulations. | Number of Men at 600 Cubic Feet each. | Number of Men for which there is deficient Accommodation. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| North and South Wings. | | | | | |
| 23 Rooms | 414 | 230 | 184 | 18 | 10 |
| 20 „ | 360 | 200 | 160 | 18 | 10 |
| 16 „ | 192 | 128 | 64 | 12 | 8 |
| Rear Range. | | | | | |
| 20 Rooms | 320 | 200 | 120 | 16 | 10 |
| 1 „ | 13 | 8 | 5 | 13 | 8 |
| 1 „ | 12 | 8 | 4 | 13 | 8 |
| North Square. | | | | | |
| 1 Room | 12 | 11 | 1 | 12 | 11 |
| 12 „ | 156 | 132 | 24 | 13 | 11 |
| 13 „ | 182 | 143 | 39 | 14 | 11 |
| 2 „ | 30 | 30 | None. | 15 | 15 |
| 2 „ | 34 | 34 | None. | 17 | 17 |
| 111 „ | 1,725 | 1,124 | 601 | — | — |

In these 111 rooms there are, therefore, 601 men more than there should be if every man had 600 cubic feet of space.

These barracks have no sufficient means of ventilation. The back to back rooms of the north and south wings communicate through the intervening walls by apertures covered by louvre boarding, but there are no apertures communicating with the external air.

The basement rooms are ventilated by apertures in the ceiling, communicating with the external air, but they are insufficient for the purpose.

The rooms in the North Square are ventilated by openings into the chimney breast, near the ceiling, and they have also perforated zinc ventilators in the walls, but both act imperfectly.

There are no ventilators in the barrack-rooms in the south square. Throughout the building the ventilation is very imperfect. This barrack owes its comparative salubrity to its high, airy position, and the wide surface it covers, but certainly not to its internal sanitary arrangements. If it happened to

have been placed in a densely populated district, it would have probably afforded a much higher rate of sickness and mortality among its inmates than it does.

The medical officer reports the barracks to have been healthy during the past 12 months. They certainly have been so when compared with other barracks at ordinary times, but, nevertheless, there have been 113 admissions into hospital from fever out of a force of 1,121 men.

All the rooms are warmed by open grates, and lighted with gas.

There is no day-room for the men.

There are 14 school rooms, situated in the north wing. They are of the usual dimensions of the barrack-rooms. They are used for the instruction of officers and soldiers of the Royal Engineers and of the Honourable East India Company.

There is an infant and industrial school in the same building, with 103 scholars, and no more than 94 cubic feet of space for each pupil. Additional school-room is required.

There are two libraries in the north wing, one for the serjeants and one for the privates. There is also an excellent museum and model room.

There are 11 ablution-rooms in the barracks.

There are two on the basement story of the north wing, five on the basement story of the south wing, two on the level of the ground in the north squares, and two in the south squares.

In nine of these rooms there is a cast-iron bath, but the use of these baths is restricted because of the occasional scarcity of water. There is, however, a bathing pond to which the men can resort.

There is a most excellent laundry attached to these barracks for the use of the Royal Engineers. It is replete with every convenience, and exhibits, in practical operation, those improvements which ought to be introduced into all barracks.

There is also a wash-house, with troughs and boilers, for the use of soldiers' wives.

Good accommodation has been recently erected for married non-commissioned officers and soldiers of the Royal Engineers. There are rooms for the families of four staff-serjeants, and rooms also for 42 other families; but the rooms are small, they are built back to back, and there are no means of ventilation. The gas burners are also unventilated, and diffuse the impure air from them through the atmosphere of the rooms. Besides these houses there are rooms for 19 families of the Royal Engineers in another building. There are likewise four small rooms in the south square for staff-serjeants.

There are two cook-houses belonging to the north wing of Brompton barracks, containing 16 boilers each, but there are no means of roasting or baking meat.

There are four cook-houses attached to the south wing, with boilers in each. In one of these kitchens only are there two small brick ovens, capable of baking four large dishes of meat in each.

In the north square there is one kitchen with boilers, and one larger oven capable of baking twelve dishes of meat.

The men are stated to appreciate this convenience very much.

The water supply of this barrack, being derived from the dockyard works, is defective for the reasons already stated. It is not enough for sanitary purposes.

There are also underground tanks for storing rain water. The water from one of these tanks was putrid, and stunk abominably. The tank is close to very offensive privies, and appeared to have been polluted by leakage.

The drainage is stated to require great attention in dry weather, apparently from deficiency in the water supply. The drainage on the north side of the barracks leads into a large covered cesspool, from which there is an overflow into the main sewer.

The arrangement is a very bad one, and ought to be done away with. The latrine arrangements are very offensive; and in one instance the matter from a large latrine was seen penetrating the barrack wall below it.

Speaking generally, the drainage is defective, and as, in certain of the buildings, there are no gutters for removing the roof water, it is apt to render the ground floors damp.

There is no proper hospital belonging to Brompton barracks; but two houses in the south wing, calculated to contain 384 men, were temporarily appropriated, at the time of our inspection, for 150 sick, with about 900 cubic feet for each.

Accommodation for sick obtained by appropriating barrack-rooms for such a purpose, it is hardly necessary to say, must be of a very defective nature. Hospitals require special structural arrangements to facilitate the recovery of their inmates, and to appropriate any part of a crowded barrack for such a purpose is simply to increase the crowding in the barrack-rooms, and to endanger the health of the men as well as the safety of the sick.

In our opinion the hospital accommodation necessary for the Royal Engineers and depôt battalions ought to be provided without delay, by extension of the garrison hospital upon an improved plan.

The sanitary defects in Brompton barracks may be summed up as follows:— Overcrowding, defective ventilation, defective sewerage and latrines, defective cooking arrangements.

*For the removal of which we recommend:—*

1. That 600 cubic feet be allotted to every man in barracks.
2. That every barrack-room and school-room be ventilated by a shaft carried from the ceiling to above the roof, and fresh air admitted through perforated zinc cornices near the ceiling.
3. That an additional water supply be obtained.
4. That all the privies be converted into water latrines, with divisions of seats and doors, and flushed out daily.
5. That all cesspools be abolished, and all drains connected directly with the sewers.
6. That the roofs be guttered where required, and rain-water cisterns provided above ground, and the present rain-water tanks abolished.
7. That all the kitchens be provided with the means of roasting and baking meat.
8. That the barrack-rooms in the south square be floored with wood, and additional light admitted into them.

*Brompton Guard Rooms and Cells.*

All the guard-rooms and cells at Brompton barracks are deficient in cubic space.

*The north wing men's guard-room* ought to contain 18 men by regulation, with only 264 cubic feet each. At 600 cubic feet per man it has accommodation for no more than eight men.

*The lock-up* ought, by regulation, to hold 30 men, with 132 cubic feet per man, in a space barely sufficient for seven men.

*The south wing men's guard-room*, like that of the north wing, has 18 men by regulation, where only eight ought to be.

*The lock-up* may be filled with 30 men, giving 150 cubic feet to each, in a room only fit for eight men at the outside.

*The barrier men's guard-room* is set apart for 22 men by regulation, in a space sufficient for eight men.

The prison cells are very small, and afford too little cubic space per man.

The three cells in the north wing have a capacity of 705 cubic feet each.

There are 10 cells in the south wing, which have no more than 312 cubic feet capacity each.

All the guard-rooms and lock-up rooms are, in our opinion, overcrowded, and they all want ventilation.

The number of inmates ought to be reduced, or the guard-rooms ought to be enlarged, and they ought to be ventilated.

The small size of the south wing prison cells shows that better accommodation for prisoners is required.

## 8. HUT BARRACKS, BROMPTON.

There are 24 huts used as barracks for recruits in the vicinity of the Royal Engineer barracks. These are situated on a high airy locality, and are well arranged for external ventilation. Each hut accommodates 22 men, with 360 cubic feet of space per man.

There are two circular ventilators at the sides for admitting air. This arrangement is not a good one.

All huts should be ventilated at the ridge, either by raising the ridge boards a little, or by inserting short ventilating shafts in the ridge.

Hut barracks have the great advantage, in a sanitary point of view, of dividing the men into small numbers, an arrangement which enables their health to be more easily preserved than when they are congregated together by hundreds under one roof. If the huts be constructed of wood, they are very likely to be permeable to air, and ventilation by the ridge will be more easily effected on that account also.

Huts should always be well raised off the ground, so as to have a free circulation of air under the flooring.

There are two lavatories of corrugated iron belonging to these huts, with 18 basins each, with water laid on, and lighted with gas.

The accommodation appears to be sufficient.

There are also two wash-houses with troughs, boilers, and water laid on.

There are two cook-houses of galvanized iron, with boilers and water laid on, and lighted with gas, but there are no means of baking or roasting meat.

There is no covered shed for drilling the recruits in bad weather.

A portion of the drainage of the huts is carried into the main sewer, and the remainder by pipes outside the works.

The latrines of these huts are the most defective part of the arrangements. Boxes are used, which are moved out, and have their contents carted away at night. The operation is very offensive, and is complained of both at the barracks and by the public.

There is no reason why this nuisance should not be removed; the boxes ought to be discontinued, and proper water latrines, with flushing arrangements into pipe drains, substituted.

*We would, therefore, recommend:—*

1. That water latrines and drainage be provided.
2. That the hut ventilation be improved by ridge ventilators.
3. That a roasting oven be provided for the cook-house.
4. It would be a great improvement to erect a covered shed for drilling the recruits—it would be the means of saving sickness on their entrance into the service.

## 9. ST. MARY'S CASEMATES.

These casemates are situated in the curtain of one of the fronts of the lines. They are two stories in height.

The lower story is below the level of the ditch in front, and consequently there is no opening at the end opposite the door, and no means of thorough ventilation.

For many years after the peace of 1815 the building was used as a powder magazine, and since 1844 the whole of it has been by degrees appropriated as barracks for soldiers and invalids returning from foreign service. Four apartments are used as store rooms for the militia.

Forty-seven casemates are used as barrack-rooms; they vary in depth, from back to front, from 59 feet 6 inches to 61 feet 6 inches; their breadth varies from 16 feet 5 inches to 17 feet; and their height to the crown of the arch varies from 7 feet 5 inches to 10 feet 6 inches. They are long, narrow, low arches, placed side by side; the lower tier resembling to some extent, in their sanitary relations, the cellar dwellings of towns.

About half of the number have four small windows at the ends and a fanlight. The other half have two small windows each, at one end only for light and ventilation. The floors are of stone and brick. There is one small fire-place for warming at the end furthest from the door.

Each of these arches accommodates by regulation 24 men. They were formerly used for 30 men each. During the Crimean war this number was reduced to 24, but since the barrack-master's return was sent to us the number has been raised again to 30.

The casemates are at present used partly for healthy men and partly for invalids.

The accommodation is as follows:—

| Rooms. | Regulation Number of Men. | Actual Occupants. | Number of Men at 600 Cubic Feet each. | Excess of Regulation Number over Accommodation. | Excess of actual Number over Accommodation. |
|---|---|---|---|---|---|
| 14 | 336 | 420 | 168 | 168 | 252 |
| 14 | 336 | 420 | 252 | 84 | 168 |
| 8 | 192 | 240 | 96 | 96 | 144 |
| 6 | 144 | 180 | 108 | 36 | 72 |
| 4 | 96 | 120 | 48 | 48 | 72 |
| 1 | 24 | 30 | 18 | 6 | 12 |
| 47 | 1,128 | 1,410 | 690 | 438 | 720 |

It hence appears that, according to regulation, 1,128 men are placed in the cubic space in which no more than 690 men ought to be placed, showing an excess of 438 men: that the actual number of occupants exceeds the regulation number by 282 men, while it exceeds the accommodation by no less than 720 men, and that even if these casemates were otherwise suitable they have space for 690 men and no more. This estimate is based on the assumption that the casemates are occupied only by healthy men: if they were all occupied by invalids at 1,200 cubic feet each, the accommodation would even in a well constructed hospital receive no more than half that number.

At the time of our inspection there were 40 invalids in the depôt, and three of the casemates were ready for the reception of more.

The ventilation is by a moveable fanlight, and by apertures lately introduced opposite the door and covered with perforated zinc. This latter improvement has, it is stated, made a beneficial change in the condition of the atmosphere, but the ventilation is still very imperfect.

Each casemate is lighted by two gas burners which have added much to the comfort of the inmates.

There is no day-room.

One casemate on the upper flat is used as an infant school, and there were 58 children receiving instruction in it. The schoolmistress lives at one end of the casemate. The cubic space would give about 125 or 130 cubic feet for each inmate.

One casemate on the upper flat is fitted up as a library.

One casemate on the lower floor is fitted up as a lavatory. It has 60 basins and is lit with gas.

There are no baths belonging to the establishment.

One of the lower casemates is set apart for washing done by soldiers' wives, but there are no stands for tubs and no washing troughs.

There are boilers for heating water, but the water is not laid on. It has to be carried from outside.

There are no foot-boards to stand on, and no means of carrying off the steam.

The staff-serjeants are provided with quarters. Other serjeants, who are invalids and married, as

well as married soldiers, are accommodated in some of the lower casemates. There are from four to six families in each casemate. Married non-commissioned officers and married soldiers of the depôt battalions live in the barrack-rooms with the men.

There are two kitchens in casemates; they are supplied with boilers, the water for which has to be carried from the outside. There are no means of cooking except by boiling. The kitchens are not ventilated.

There is no covered shed for drill and no cleaning-room.

Water is obtained from the Brompton reservoir, which receives its supply from the dockyard works.

There are also wells, but their yield has decreased in consequence of works at the docks.

The drainage is carried down to the river.

New privies have been recently constructed.

As a place for receiving, on their return home from foreign service, men whose health has been injured, perhaps irreparably in the service of the country, the casemates of St. Mary's establishment are entirely unsuitable. We have no hesitation in stating that they should not be used for such a purpose for a single day longer than may be necessary to provide other accommodation.

The lower casemates are more like cellars than living-rooms. They are damp, dark, and insufficiently ventilated; and, during the warm weather, when invalids arrive in largest numbers, they are greatly overcrowded.

It may, therefore, be inferred that the chief reason why the mortality is not greater, is the short time the men are kept in these places, and to the same cause it is to be attributed that the health of the depôt does not suffer so much as otherwise might be expected.

Even as it is, the number of admissions into hospital, as well as the mortality among invalids, is very great.

Returns sent to us for 22 months preceding Oct. 31, 1857, show that out of an average monthly strength of 749, there were 6,393 admissions into hospital and 142 deaths.

It would thus appear that the admissions per annum are four and a half times the average strength, while the deaths to strength have been 103 per 1,000 per annum. Of these deaths nearly 40 per cent. arose from phthisis. This mortality, it must be remembered, takes place among invalids who have already passed through hospital and been weeded there of the worst cases by death. There is sufficient reason for believing that the sanitary condition of these casemates acts injuriously on the health of the invalids in them.

They are certainly the last places to which consumptive invalids ought to be sent, whether we regard their exposed position, the neighbouring wet marshy ground, or their very defective sanitary condition.

The real difficulty is to know what to do with them. Were there accommodation for the invalids elsewhere, they ought to be at once removed and the casemates vacated; while on the other hand it would require a large outlay to make them habitable as barracks for troops.

There appears to be no course open except to deal with them as we would do with a barrack, and to allot 600 cubic feet for each man in them.

*We advise, therefore:—*

1. That 600 cubic feet of space be allowed to every inmate of the casemates.

2. That all the casemates be provided with additional means of ventilation by air-shafts at the end opposite the door, and that perforated zinc panes be introduced into the fanlights to admit fresh air at all times, and that all the gas-burners be ventilated.

3. That the lower casemates be floored with wood.

4. That the kitchens be fitted up with a suitable roasting and baking apparatus.

5. That the wash-house be fitted up with wooden gratings and stands for tubs, or with washing-troughs, and that a suitable laundry stove be provided.

6. That the privies be converted into water latrines, with suitable flushing apparatus, and flushed out once a day.

There are three guard-rooms and two lock-up rooms connected with the casemates. They are all overcrowded and imperfectly ventilated.

1. *The barrier guard-room* ought to accommodate, according to regulation, 12 men in 1,710 cubic feet of space, giving 142 feet per man. It happens to be occupied by one man. The regulation number of men ought to be reduced from 12 to 3.

2. *St. Mary's guard-room* has regulation accommodation for 14 men, giving only 207 cubic feet for each. It ought to contain no more than six men.

3. *The Magazine guard-room* has 14 men where only six ought to be.

4. In *St. Mary's guard lock-up*, each inmate has only 262 cubic feet when it is occupied by the regulation number of 10 men. At 600 cubic feet per man it would hardly accommodate half the number.

5. The *regimental lock-up* would accommodate 12 men in a space in which 20 men may be placed according to regulation.

All these guard-rooms and lock-up places require ventilation through the ceilings and roofs, besides reduction of numbers so as to give 600 cubic feet per man.

We have made these recommendations in order that the more urgent defects in this establishment may be removed at the least expense; but were it practicable there can be no doubt as to the propriety of removing the troops and invalids from them entirely.

They are best adapted for use in cases of necessity, as, for instance, during a siege, when they may be the means of saving life—at present their effect is probably the reverse.

We have, &c.

## TILBURY FORT AND GRAVESEND.

SIR,

WE have the honour to transmit to you the following Interim Report on the barracks and hospitals of Tilbury Fort and Gravesend, both within the Chatham district.

### 1. TILBURY FORT.

This fort is situated on the north side of the Thames, opposite Gravesend, within a few yards of the river. The whole district for a considerable distance round the fort is undrained and marshy, and the inhabitants are liable to attacks of intermittent fever. The ground occupied by the fort is a little above the level of the surrounding country; but it is, nevertheless, about three feet below high-water mark in the river. A broad deep moat passes round three sides of the defences, and the whole subsoil, which consists of alluvial mud, is saturated with water.

The total area within the fort is 3A. 1R. The buildings are of brick, and are supposed to have been erected about 1685.

The soldiers' rooms are in two ranges, situated on the western side of the enclosure. One of these ranges is two stories high, and the other is one story high. At the northern extremity of the one-story range is situated the hospital, and at the southern end are the cook-house, ablution-room, and wash-house. The privies and urinals are in a separate line of out-houses, close to the hospital, and to the end of the two-story range.

The barrack-rooms run through the building from front to back, and have windows at both ends. The upper flat of rooms is reached by an outside stair and corridor, which also serves as a verandah to the rooms behind. There are altogether 14 soldiers' rooms, all very nearly of a size. They are from 33 to 35 feet long from front to back. They are from 14 feet to 14 feet 9 inches wide, and from 8 feet 4 inches to 9 feet 3 inches high. They are not good rooms, on account of their lowness in the ceiling, and the distance between the opposite windows. The beds are ranged along the dead walls, and the rooms are so narrow that when the bedsteads are turned down there is only about seven inches of space from foot to foot of the opposite beds.

In the long one-story building there is a much better room, which was originally intended for a day-room. It is about 84 feet long, nearly 20 feet wide, and 10 feet 3 inches high. It has a range of windows on one side, and a corresponding range of half windows on pivots on the opposite side. One barrack-room was formerly a chapel and school-room; it has no fire-place, and is warmed by a stove. The adjoining vestry is also used as a barrack-room; neither has any means of ventilation. They require perforated panes of glass in the windows.

If the barrack-rooms were occupied according to regulation, there would be a considerable amount of overcrowding in them, as may be seen from the following table :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 2, 3, 4 - | 30 | 18 | 12 |
| „ 5, 6, 7, 8, 9, 10, 11, 12, 13. | 126 | 72 | 54 |
| „ 14 - - | 5 | 3 | 2 |
| „ 15 - - | 40 | 30 | 10 |
| Total - | 201 | 123 | 78 |

By giving somewhat less than 600 cubic feet per man, the accommodation in these rooms is sufficient for 123 men, allocated as follows: Rooms 2, 3, 4, should have six men in each; rooms from 5 to 13 inclusive, should have at the outside eight men in each; and rooms 14 and 15 should have respectively three men and 30 men allotted to them.

The number of men actually in occupation is smaller than the regulation number, and is almost the same as could be accommodated at 600 cubic feet per man; but the men are so distributed that while some rooms are empty, or nearly so, others are crowded. This could be obviated by re-arrangement, and in so malarial a situation the number of men left on guard in the fort should be as few as possible. At the present time the majority of cases admitted to hospital are of intermittent fever, a disease which, if it once attack a man, is extremely apt to recur from very slight causes, and to send the patient frequently to hospital, especially on foreign stations. The more men are kept from unnecessary exposure to marsh miasm at home the better. Occasional changes among the troops in such places as Tilbury Fort are therefore advantageous to health. The usual sanitary precautions as to drainage, cleanliness, ventilation, prevention of overcrowding, &c., are, if possible, more necessary in malarial districts than in healthy ones; and by attending to these matters much of the injurious effects of malarial positions at home may be warded off.

All the barrack-rooms are to a certain extent ventilated, but not sufficiently so, and they are very close at night. The lower rooms have a Sheringham's ventilator at each end, but they have no outlets for foul air.

The upper rooms, and also the long room, No. 15, have openings through the ceilings into the space under the roof, but the arrangement doe not give sufficient outlet, and there are no inlets, for fresh air.

All the rooms should be provided with shafts of the usual form and section to be carried from the ceiling through the roof. Those rooms which have no inlets should be provided with them, and the rooms which have inlets ought to have them enlarged to the required area for the number of inmates.

It is very necessary that barrack-rooms, in such a situation, should, as far as possible, be supplied with fresh warm air, and to ensure this the present grates should be re-modelled to warm part of the admitted current.

All the rooms are lighted by candles; gas cannot be had.

The ablution-room is built against the retaining wall of the terreplein. It has slate ablution benches without ledges; and basins, but water is not laid on, and there is no tank. A large tub in the middle of the floor is the only storeage for water, and it is sometimes used for a bath by the men. There are no pegs for hanging up coats, nor gratings for the men to stand on while washing. Light is admitted to the room by a skylight, but there is no ventilation. A louvre in the roof is required for this latter purpose.

A proper water tank ought to be put up in the ablution-house, and water laid on from it to the tables, and two baths with water laid on ought to be supplied.

There is a small women's washhouse dark, unventilated, and having no means of washing or getting up linen, except a wooden bench and a boiler. The building was formerly an open cleaning shed, and admits of being lighted and ventilated through the roof. It should have a water tank and tubs, and accommodation for drying and ironing linen.

The cook-house has six fifteen-gallon boilers, and a common baker's oven heated with wood. An oven less expensive to use could be put up in the space occupied by the present one, but we do not think it so absolutely necessary as to advise a change to be made. The boilers, however, might be re-set to save fuel.

Water is obtained for the use of the fort by collecting most of the rainfall from the roofs, and by an artesian well 470 feet deep, in which water rises to within 10 feet of the surface, and affords a supply to the extent of 20 gallons per minute. The water contains mineral impregnation, and is not clear. It requires boiling to clear it; it is, hence, only used for ablution purposes. With proper means of raising it this well water might be used for baths, washing, latrines, &c.; and the rain water supply should, at the same time, be extended by collecting the roof water from the new shed recently erected for field batteries.

The privies are of the usual defective construction. They are placed over a sewer carried into the Thames, and when the tides are low enough water is admitted by a sluice from the moat to wash them out. The process is, however, a very imperfect one, and the privies are consequently very offensive.

They should be reconstructed as water latrines, with a supply tank kept full by pumping. They should be properly lighted and ventilated through the roof, and provided with divisions of seats and half-doors.

There is a urinal adjoining the privies, which requires water to be laid on for cleansing it.

We have been informed that during the hottest weather the tides often do not rise sufficiently high to flow into the ditch, which, during long droughts, becomes putrescent, and dangerous to the health of the men. It is stated that this defect might be remedied by admitting water to the inner ditch by

a sluice, which would enable the water to be renewed once a fortnight, and the ditch to be kept full.

The guard-room is a low-ceiled room, 9 feet 4 inches high, without means of ventilation. It requires both an inlet and outlet. For the former purpose we would advise a large silk flap ventilator being placed in the chimney, at a height of eight feet from the ground. An inlet ought, at the same time, to be provided, by remodelling the fire-grate to warm the air, which ought to be introduced by a flue, opening close to the ceiling, above the silk flap ventilator, and at as great a distance from it as possible.

Adjoining the guard-room is a dark lock-up room without any direct communication with the external air. The only means of ventilation is by a grated opening above the door. A shaft should be carried up from the ceiling of the room, as an outlet.

There are two cells at a considerable distance from the guard-room, and having no communication with it. They likewise require ventilation, and should each have a small shaft carried from the ceiling to above the roof.

Tilbury Fort is deficient in day-rooms, married quarters, drill-shed, and workshops. The sanitary improvements required are as follow :—

1. Reduction of the regulation number of men in each room to the extent stated.

2. Ventilation of the barrack-rooms by shafts from the ceiling to above the roof, and by inlets as described. Ventilation of the guard-room. Fire-grates to be re-modelled. Ventilation of the lock-up and cells.

3. Ablution-rooms to be properly supplied with water ; ledges to be put on the tables, and gratings and pegs put up. Ventilation to be provided through the roof. Two baths, with water laid on, to be provided.

4. Women's wash-house to have tubs, gratings, and water laid on, and to be lighted and ventilated through the roof. A drying and laundry stove to be provided.

5. Privies to be reconstructed as proper water latrines, and to have divisions of seats, half-doors, and light and ventilation through the roof. Urinals to be supplied with water.

6. A sluice to be provided for keeping the moat full of water.

*Tilbury Fort Hospital.*

The hospital, as already stated, is situated at the end of the men's quarters, and close to the privies. It is a two-story building, and contains four wards. There is a central passage and staircase, with the wards and offices entering out of it. On the ground-floor there is a ward, and the surgery and kitchen. This ward has a ventilating beam in the roof, bent at right angles, and opening to the outside on the front and end of the building. It has three windows, two to the front and one to the end, and has a door leading into the 40-men barrack-room.

On the upper floor are two small wards, and one large one, the counterpart of the ward below. All these wards are much overcrowded, as will be seen by the following table :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| No. 1 - | 10 | 5 | 5 |
| 2 - | 5 | 2 | 3 |
| 3 - | 5 | 2 | 3 |
| 4 - | 10 | 4 | 6 |
| Total - | 30 | 13 | 17 |

The wards have Sheringham's ventilators into the passage, but the passage itself is not ventilated. The whole building requires additional ventilation. The passage and stair should be ventilated by a shaft through the roof, and by panes of perforated glass.

Each of the larger wards requires a shaft carried from the ceiling to above the roof, and when this is done the ventilating beam will act as an inlet.

Each smaller ward requires a silk flap ventilator in the chimney.

The kitchen, being under a ward, should have a shaft carried from its ceiling to above the roof, and perforated glass panes in the windows.

All the ward fire grates should be remodelled.

The hospital is deficient in bath-room, ablution-room, and serjeants' quarters. It has a water-closet on the landing, recently constructed. Water for it is supplied by manual labour.

There were no sick in the hospital when we inspected it, and the wards contained soldiers' beds arranged for occupation as in a barrack-room.

The medical men do not like to put sick into the building, on account of its malarial position, and the prevalence of intermittent fever. On the other hand it is stated that the medical officers live at Gravesend, whither all cases of illness are taken for treatment.

There can be no doubt that the site of Tilbury Fort is not a healthy one, either for sick or well, though from the usual strength, there are very few cases of disease likely to occur in it which could not be removed at once to Gravesend.

The hospital at Tilbury should, nevertheless, be improved to such an extent at least as to enable it to be occupied either by sick or by healthy men without incurring the expense that would be required to make it a complete hospital.

*The following Improvements will answer either for a Hospital or Barrack :—*

1. Ventilation of the larger wards by a shaft, and of the smaller wards by a silk flap ventilator into the chimney. Remodelling the ward grates to warm part of the admitted air. Ventilation of the staircase by a shaft and perforated glass panes.

2. Reducing the total number of beds, if used for sick, from 30 to 13, in the manner pointed out in the preceding table.

3. Allotting a number of beds in each room, if used as a barrack-room, sufficient to give, as nearly as may be, 600 cubic feet per man, namely in room No. 1, ten beds ; in rooms Nos. 2 and 3, four beds in each ; and in room No. 4, eight beds.

## 2. NEW TAVERN FORT, GRAVESEND.

New Tavern Fort is situated at the east end of Gravesend, about 40 yards from high-water mark in the Thames, and a little above its level. On the west side the fort adjoins the town, and on the east side it overlooks the river and the marshes. The total area within the works is one acre, one rood in extent ; the subsoil is chalk ; and the barrack and hospital are situated on the side of the enclosure nearest the town. The older buildings have massive thick walls and small windows. They were part of a chapelry in the reign of Henry VIII. The chapel itself is divided into floors, and contains barrack-rooms and hospital wards one over the other. The buildings were all revised and repaired in 1841, and have existed in their present form since that date. Besides the old chapel, there is a range of two-storey buildings fronting the public street, in which are the non-commissioned officers' quarters, master gunners' quarters, &c.

There are five soldiers' barrack-rooms with accommodation for 39 men, and two rooms for invalids who are not unfrequently landed in considerable numbers at Gravesend on their way to Chatham.

The following table shows the accommodation :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Soldiers No. 1 - | 10 | 7 | 3 |
| „ „ 3 - | 7 | 5 | 2 |
| „ „ 4 - | 8 | 6 | 2 |
| „ „ 9 - | 9 | 7 | 2 |
| „ „ 10 - | 5 | 2 | 3 |
| Invalids „ 2 - | 11 | 5 | 6 |
| „ „ 7 - | 1 | 1 | — |
| Total - - | 51 | 33 | 18 |

There is accommodation in these rooms for 27 soldiers and 6 invalids, instead of 39 soldiers and 12 invalids which is the present regulation number.

The soldiers' rooms in the old chapel are of a very inferior character ; they are only 7 feet 6, 8 feet 9, and 9 feet 6 inches high. Four of the rooms have two windows each, and the five-men room has only one window. The windows are on one side the room, and the door on the other. The rooms are low and gloomy, and the means of ventilation are very deficient. The upper sashes of some of the windows do not open.

All the rooms have a small Arnott's ventilator in the chimney, but it is quite insufficient for purifying the air in the rooms.

A small bed-room grate is used for warming. Each room has a gas burner in it, but without any means of carrying off the fumes, except the ventilator.

The ablution-room and women's washhouse are in a building at a short distance from the men's rooms ; the former has a slate table without a bead, and there are no gratings nor pegs. There is no bath except a large tub at the end of the room.

The women's washhouse has a boiler, but no fixed tubs, and no means of drying linen.

Behind the chapel there is a small building close to the hospital entrance, in which are situated two cookhouses, one belonging to the barracks and the other to the hospital. They are very confined, and the hospital kitchen is nearly dark. In the barrack cookhouse there are two boilers, but no oven, and there is very little space for one.

Water is derived from a well, and is stated to be abundant and good.

The barracks are surface-drained into the river, but two of the drains require trapping. The privies are of the usual barrack construction, and placed over cesspits, although there are ample means of drainage at hand.

The barrack is deficient in day-room, school-room, and store-room.

The guard-room is an old, dark, and dirty building, and it has no sufficient ventilation. The adjoining lock-up room is also very defective.

All the barrack-room accommodation in this fort is of a very imperfect kind, and by far the best thing to do would be to rebuild the whole of it. The present buildings are not susceptible of much improvement, and we should propose to limit our recommendations to those points absolutely necessary to health.

1. Each man's room should be ventilated by a shaft and inlet ; and the windows should be made to open at top. The guard-room and lock-up should be ventilated by shafts, and the former should have a remodelled grate for warming the admitted air.

2. An oven to be supplied to the kitchen.

3. Ablution-room to have gratings and pegs.

4. A drying stove to be put up in the women's washhouse.

5. Privies to be constructed as water latrines, with divisions of seats, half-doors, light and ventilation ; to be drained into the river, and the cesspits to be abolished. Untrapped drains to be trapped.

*Gravesend Hospital.*

As already stated, the hospital of New Tavern Fort is in the upper floor of the old chapel. It contains three wards, and has regulation space for 27 beds, and is very much overcrowded, as will be seen from the following details :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| No. 1 - - | 6 | 2 | 4 |
| „ 5 - - | 12 | 6 | 6 |
| „ 6 - - | 9 | 3 | 6 |
| Total - - | 27 | 11 | 16 |

The wards, in addition to being overcrowded, are deficient in requisites for the care and treatment of the sick, for which, indeed, they are quite unfit.

Excepting in its malarial position, the hospital at Tilbury fort is better adapted for receiving sick than the one at Gravesend, and it would be well to consider whether Tilbury Fort hospital might not be so used.

At present Gravesend hospital receives sick, not only from other barracks, but also from invalid ships arriving from abroad. If it must be retained for these purposes, a proper hospital should be built, for which there is plenty of Government ground close at hand : and until this be done we would recommend simply that each ward be ventilated by a shaft through the roof, and by an inlet at the eaves.

## MAIDSTONE BARRACKS.

SIR,

WE have the honour to transmit to you the following Interim Report on Maidstone barracks :—

Maidstone barracks are in the Chatham district, but we have considered it better, on account of their not being in the garrison, to report on them separately.

They are cavalry barracks, used as a depôt for all cavalry regiments going to India. They stand on 17A. 3R. 1P. of ground, the subsoil of which is clay and Kentish rag.

They are situated at the outskirts of the town of Maidstone, on the slope of a hill, at the foot of which runs the Medway. The barracks are about 56 feet above the level of the river.

The buildings lie in the form of a rectangle enclosing the parade ground.

They are built of wood, with brick footing ; about four feet high.

The higher side of the rectangle is occupied by the barracks. They consist of three blocks, the centre block is occupied by officers' quarters, and the side blocks are occupied by the men.

This barrack exhibits an illustration of one very good principle of construction. The stables are not under the barrack-rooms, but occupy two sides of the rectangle, an arrangement far more favourable to

health than having the stables under the rooms, as is generally the case in cavalry barracks. On the lower side of the rectangle is situated the hospital and the riding school, some temporary stables, and a room built for a saddlemaker's shop, at present misappropriated to the band.

The barrack-rooms are dark, and the lower rooms are rather low in the ceiling. In the upper rooms the ceiling follows the slope of the roof.

The following is the allotment of accommodation in comparison with what it would be at 600 cubic feet per man :—

| Rooms. | Total Number of Men by present Regulation. | Total Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 20 | 360 | 230 | 130 |

There is room space, therefore, approximately for about 230 men, and no more.

All the rooms require ventilation by shafts, and inlets for the admission of air. Additional light should be admitted to the upper rooms by sky-lights.

The staff-serjeants' quarters are very imperfectly ventilated, and should have Arnott's silk flap ventilators fitted into the chimney, and inlets for air.

The serjeants' mess-room is complained of as being too small.

The orderly room has no covered space for persons to stand in in wet weather, they must stand outside and get wet ; a verandah would remedy this.

These barracks, which appear to have been originally temporary structures, would require reconstruction to make them what barracks ought to be, and this should be kept in view in making any alteration in them.

The school-room is dark, but has ventilation.

There is a small room used as a library to give out books.

The cleaning shed is used as a place from which to issue the provisions.

The urinal is not supplied with water, and is offensive.

The privies drain into cesspits, and are very objectionable, and most offensive. The opening to one of these cesspits is close to a sentry box.

These privies should be improved by converting them into water latrines, and providing them with divisions to the seats, and with half doors. These improvements might be carried out at once, attention being paid to suit the privies when rearranged, to some general plan for rebuilding the barracks.

The ash-pits should be removed, and iron carts substituted, for the daily collection and removal of refuse. The manure heaps should also be placed farther off the barrack square.

The ablution-room is near the back of the stables ; it is dark, damp, and unventilated. The water is obtained from a pump. The benches are of wood, the basins almost worn out, and there are no gratings for the feet. Baths are required in the proportion of one to every 100 men.

The women's wash-house has no drying stove.

The cook-house has no means of baking or roasting ; a space for an oven might be obtained from the armourer's shop, which is close to the kitchen.

The stables are old, they are ventilated in the ridge of the roof.

The water supply of these barracks is entirely from wells. It is in contemplation to supply the town of Maidstone with water from a distance, in which case the barracks could easily be supplied from the mains.

The bases of all sanitary improvements in Maidstone barracks are sewerage and water supply.

The whole barrack requires sewerage, all cess-pits should be abolished, and the whole fluid refuse conveyed away in properly constructed drains. Until the town of Maidstone is supplied with water, it will be requisite to have a suitable pumping apparatus and tank to supply the latrines, urinals, lavatories, &c.

*The following are the Sanitary Improvements immediately required :—*

1. Ventilation of all the barrack-rooms, the guard-room, and lock-up, by shafts from the ceiling, and inlets for air ; and also the non-commissioned officers' rooms in the manner pointed out.

2. Reduction of numbers so as to allow 600 cubic feet per man in every barrack-room.

3. Reconstruction of privies and their conversion into water latrines, with suitable means of drainage and flushing. Supply of water to the urinals for frequent flushing and washing. All cesspools to be abolished, and proper drainage to be substituted throughout the barracks.

4. Providing a sufficient roasting apparatus for the cook-house.

5. A drying-stove to be provided for the wash-house.

6. Lavatories to be improved and lighted by sky-lights, gratings to be provided for the men to stand on, and bathing accommodation in the proportion of one bath to 100 men to be attached to the lavatories.

7. Iron carts to be substituted for ash-pits, and manure heaps to be removed as far as possible from barrack-rooms and hospital.

8. Additional light to be admitted to the school room.

*Maidstone Hospital.*

This building is situated at the lower end of the barrack enclosure.

The wards are at the corners of the building, and, except one of the lower wards, they have windows on two sides.

There are five wards, containing in all 52 beds, with a cubic space ranging from 819 to 1,029 cubic feet per bed.

The following table shows the present accommodation per ward, contrasted with what it would be at 1,200 cubic feet per bed :—

| Wards. | Regulation Accommodation. | Accommodation at 1,200 Cubic Feet per Bed. | Deficiency of Accommodation. |
|---|---|---|---|
| 1 | 6 | 5 | 1 |
| 2 | 8 | 7 | 1 |
| 3 | 6 | 5 | 1 |
| 4 | 16 | 10 | 6 |
| 5 | 16 | 10 | 6 |
| — | 52 | 37 | 15 |

There is space for 37 beds in this hospital, a number which will be found sufficient for all ordinary occasions with such a force as occupies the barracks.

The orderlies sleep in the wards ; a most objectionable custom, which ought to be put a stop to, and proper sleeping accommodation for the orderlies provided.

The wards are lofty and admit of ventilation by the windows, but their ventilation would be improved by shafts and inlets for air. The walls are of wood, and the building is complained of as being cold in winter and hot in summer.

The water-closet is stated to be of bad construction, and to get often out of order.

A range of officers' stables has been constructed with the end close to the hospital.

These stables are not properly ventilated, and the

smell from them can be perceived in the hospital wards.

The kitchen is dark and small; it is stated to be sufficiently supplied with means of cooking. The ablution-room is narrow. Baths are about to be supplied, but a covered communication between the bath-room and the hospital will be required. The privies are over a drain which runs into the river; they should be converted into proper water latrines, an flushed daily. An iron cart or barrow should be substituted for the ash-pit.

The pack store is very damp.

The dirty linen closet adjoins the coal cellar; a better one is much wanted.

The provision store requires a stove.

The water supply is derived from a shallow well, over which part of the officers' stable has been built. The well was open at top, for examination, at the time of our inspection, on account of the water having been rendered impure, apparently from infiltration from the subsoil of the stable.

Accidents such as this can only be avoided by obtaining a proper water supply for the whole barracks.

*The following are the Sanitary Improvements required for this Hospital:—*

1. Ventilation of wards by shafts and inlets for air as pointed out. Ventilation of the central staircase by a louvre in the roof.
2. Reduction of numbers of beds from 52 to 37, so as to give 1,200 cubic feet for each.
3. Present water-closets to be replaced by others of better construction,
4. Baths with a covered communication with the hospital to be supplied.
5. Privy in back yard to be converted into a water latrine, and a small iron cart to be provided in lieu of the ash-pit.
6. Foul linen closet to be provided.
7. Accommodation to be provided to enable the orderlies to sleep out of the wards.

We have the honour to be, &c.

SIDNEY HERBERT.

*Barrack and Hospital Improvement Commission*, October 4, 1858.

---

## SHEERNESS DISTRICT.

THE barracks and hospital at Sheerness, at present occupied by troops, have been erected since the beginning of 1847. The old barracks have been converted into a large school, married quarters, &c.

The new barracks consists of two ranges of rooms, and a range of officers' quarters, forming together one long range in three blocks, running nearly parallel with the sea-shore, and at a short distance from high-water mark.

The line of the works passes immediately behind the barrack ranges, and between the works and the sea there is some undulating sandy ground, used at present partly as a drying ground. The hospital is situated at a short distance from the barracks, and forms a range of buildings isolated and standing by itself, nearly at right angles with the barrack ranges. It is not within the same enclosure as the barracks, although within the lines. The whole establishment, as well as the dockyard and that part of Sheerness called "Blue Town," occupy a point of alluvial land thrown up where the estuary of the Medway joins the sea. A short distance inland, and just outside the works, is another part of Sheerness called "Mile Town," and further inland there is a long stretch of low ground having a radius of about two miles in length, and which is bounded by a chain of low hills to the east and north.

The shores of the estuary of the Medway consist of similar stretches of low alluvial ground more or less covered by the tide at high water. Most, if not all, of the ground in the immediate vicinity of Sheerness itself, has been gained from the sea and estuary by embankments, and it is almost all several feet below the level of ordinary high-water mark. At high tides the sea and river rise to the top of the embankments, and during a recent exceptional high tide, accompanied by a strong north-east wind, the sea overflowed part of the embankment close to the works, and flooded the intervening land.

The country round Sheerness is traversed by broad ditches, partly for defence purposes and partly as a means of freeing the neighbouring land from superfluous water. But there is no drainage, in the proper sense of the term, in any part of the district. Drainage, meaning thereby the removal of all subsoil water to a sufficient depth to make the country healthy, does not exist at present, and cannot exist unless special works similar to those which have been introduced in other marshy districts be resorted to. Another consequence of the want of outlet is, that neither Blue Town nor Mile Town are drained. The whole cesspool drainage has passed into the subsoil ever since they were occupied; all the surface drainage and foul water has taken the same course, unless there has been some hollow into which it could flow. Hence foul stagnant pools of considerable extent exist in several places close to inhabited districts, and the whole atmosphere is tainted with malaria, which extends to some distance from the shore, and produces fever on board men-of-war lying in the Medway.

The usual explanation given of the occurrence is, that intermittent fever is "endemic" in the district. But when we come to ask the further question, why is it endemic? we must reply that the only reason why ague is there at all is simply from *neglect*.

The shores of the Medway and the country around ought, in the 19th century, to be free of ague. If other large districts of England had been neglected in the same way as this corner of the country has been, ague would have constituted a large item in our annual sick and mortality table; but, thanks to enlightened improvement, there is little opportunity of studying ague in its haunts now-a-days unless we go to such places as Sheerness, and other equally unimproved districts along the Thames.

It is time that these marshy, fever-producing districts of England should be dealt with on some general principle of improvement; but in so far as regards Sheerness and two or three other places, the matter is not one of local interest merely, but of national importance.

A large number of men, chiefly of the Royal Artillery, are constantly on duty along the banks of the Thames. The new barracks at Sheerness were intended to hold above 1,000 men. There are a number of persons on duty at the dockyard, besides the crews of men-of-war in the river. All these men in the public service are exposed to the subtle action of marsh malaria, which may not show itself at the time, and perhaps not at all until the men are sent on foreign service within the tropics, when it is found that they give way under the influence of marsh malaria, which ought not to have affected them had the previous constitutional taint not been contracted at home. Even on home service hospital returns have entries of men received into hospital from fevers contracted during service on the banks of the Thames, as in times past was the case with men who had been at Walcheren.

The admissions into Woolwich hospital for ague, occurring among artillerymen engaged on service

along the Thames, have averaged 120 per annum for a number of years past.

During the last three years an eighth part of the force quartered at Sheerness has passed through hospital for intermittent fever every year, notwithstanding frequent changes in the troops.

In a return sent to us by the Director General, it is stated that "On an average of 3¼ years (1857–58–59, and three months of 1860,) the admissions have amounted to 960 per 1,000, being exactly the same as the average of the cavalry, and lower than that of the infantry serving in the United Kingdom.

"The most striking fact with regard to the sickness is the large number of cases of intermittent fever, amounting to 125 per 1,000 of the strength, while the average, as shown in the last volume of the Statistical Reports, was 0·55 in cavalry and 2·74 in infantry."

It hence appears that above an eighth of the total admissions at Sheerness have been caused by ague; that for every admission from ague among the infantry generally, there were 45 at Sheerness, and for every admission among the cavalry there were 225 at Sheerness, on the same strength. On the 10th April, the day we inspected the barracks, one half of all the men in hospital were suffering from ague.

The only remedy for such a state of things is, thorough drainage of the whole district. The air everywhere is tainted by the poison, for we were informed by the medical officer that no difference in liability to the disease was found to exist among men on duty in one part of the garrison more than another. It was stated to us, however, that the inhabitants of Mile Town are more subject to the disease than those of Blue Town. The drainage of both is equally bad, but Mile Town is a little more inland, and there is more stagnant water about it.

The new barracks are constructed in a number of houses two stories high. Each house has a passage and staircase running through and through the building, and along the sea face of each range there is an arched verandah, supported on iron columns, which affords covered communication for all the rooms on each floor. Each house contains eight rooms, four on each floor, so that all the rooms are back to back, half of them with windows towards the sea, and half of them lighted from the south or land side.

These barracks contain 56 men's rooms, all of a size. Each room is 28 feet long, 20 feet 3 inches wide, and 12 feet 6 inches high. They are all 14-men rooms; but 13 of the rooms have 13 men in each with a berth for a non-commissioned officer. Including the non-commissioned officer, each inmate of the rooms has 506 cubic feet of space. Each room has two windows, 7 feet high by 3 feet 6 wide. The rooms on the south side are well lighted, but those on the north side are gloomy, partly on account of the exposure, partly on account of the verandah.

The old barracks are situated at the dockyard end of the new barracks, close to the dockyard gate. They are, like most barracks of the period, imperfectly constructed, low-roofed, and inconvenient. They form one side of the old barrack square. Opposite to them are the guard-room, cells, &c., and on the north side of the square is the canteen, an old, half-ruinous building, hardly fit for occupation.

The rooms in the old barracks are back to back, with small windows on one side only. They are nine feet high, and of varying lengths and breadths. They are from 18 to 19 feet long, and from 15 to 19 feet broad. Altogether there are 45 rooms on the construction as men's rooms, with regulation space for 346 men. These rooms are all bad, and hardly fit for permanent occupation. At present they are chiefly used as married quarters,

The following table shows the present accommodation in both barracks, in contrast with what it would be at 600 cubic feet per man.

| Number of Rooms. | Total present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Number of Men which each Room should contain. |
|---|---|---|---|---|
| New Barrack. | | | | |
| 56 | 784 | 672 | 112 | 12 |
| Old Barrack. | | | | |
| Houses A and C. Nos. 1, 2, 3, and 4, in each (8 rooms) | 56 | 32 | 24 | 4 |
| A., 5 to 14<br>B., 1 to 4<br>C., 5 to 12<br>(22 rooms) | 176 | 110 | 66 | 5 |
| B., 5 to 12<br>(8 rooms) | 72 | 40 | 32 | 5 |
| D., 3 and 4<br>E., 1 to 5<br>(7 rooms) | 42 | 28 | 14 | 4 |
| 45 rooms | 346 | 210 | 136 | — |

It hence appears that there is space in the new barracks for 672 men at 600 cubic feet per man, and for 210 men in the old barracks at the same allowance; making in all 882 men instead of 1,130 men, which is the present number on the construction.

None of the barrack-rooms are ventilated, but those in the new barracks have had remodelled grates put into them. Unfortunately, the method of obtaining air to supply these grates is not a very good one. It is a necessary principle in ventilation to take the fresh air to as great an extent as possible from some elevation above the level of the ground, a matter of especial importance where the soil is malarial in character. In this instance, some of the inlets for fresh air are made above ground, but the general plan has been to take the supply from the level of the ground, close to untrapped gulleys; to carry the supply along the ground, below the flooring of the ground floor of the barracks, and then to carry it up in flues to the spaces behind the fire-grates. This defect can be to a considerable extent remedied by carrying a brick shaft or flue from the inlets at the end of the ranges up to a height of 10 or 12 feet from the ground, so that the air might pass from this height down the shaft before reaching the inlet, instead of sweeping directly over the surface close to gutters and gulley grates as it does at present.

Each room should have the usual ventilating shaft and inlets from the open air. The former carried up in one corner at a distance from the fire-place; the latter close to the ceiling, between the windows. It would be advisable also to ventilate each staircase by a shaft carried above the roof.

The old barracks should be ventilated in a similar manner, at least all such rooms as are intended for future use as barrack-rooms, and all the windows should be made to draw down at top, which is not the case at present.

All the non-commissioned officers' rooms should be ventilated by Arnott's ventilators.

A very good school-room has recently been made in the old barrack by throwing together eight men's rooms. It is well lighted and warmed, but requires more ventilation, which could easily be given round the upper end of the stove pipe. Fresh air should also be brought from without, and allowed to enter the room round the base of the stove.

There is a good library in the left wing of the barracks. It should be ventilated like a barrack-room.

There are four ablution-rooms belonging to the new barracks and one belonging to the old barrack. They are fitted up with slate benches, basins, and gratings, but there are no pegs; and they require more ventilation.

One bath has recently been put up in one of these ablution houses, but it is not sufficiently separated from the place where the men wash. It requires higher partitions.

At least seven baths would be required for the number of men in barracks.

Attached to the new barracks there are four women's wash-houses, fitted up with coppers, fixed tubs, and water laid on. They require means of drying linen.

There is a wash-house belonging to the old barrack of a very inferior character. It requires to be improved in the same way as the wash-houses belonging to the new barracks.

The new barracks have four cook-houses, and the old barracks one. They are fitted up with the usual boilers, and in one of them is a brick oven, which appeared not to be in good repair. As this oven is at a considerable distance from some parts of the barracks, it might be desirable to provide another.

There are no cleaning rooms.

There are no drill sheds specially calculated for their object, but there are two verandahs, already mentioned, running along the back of the barrack ranges. These verandahs are each 200 feet long and 10 feet wide. They are used for drills occasionally, but they are very insufficient for such a purpose. They are not wide enough for drilling, but they are too wide for the light of the rooms, which they obstruct materially in every room along one entire side of both flats of the new barracks. One half of all the rooms are darkened by these verandahs. This evil in the upper rooms might be mitigated by glass skylights over each window in the upper flats; but this could not be done for the lower flats.

These barracks are deficient in workshops. The only shops are one for tailors and one for armourers. The tailors' shop requires ventilation by a shaft and inlet. The armourer's shop requires a louvre in the roof.

Water for the whole establishment is derived from a well within the lines, having a depth of 125 feet, from which water is raised by a steam engine to a tank placed on a water tower, from which pipes are laid to the barracks and hospital. The present yield of water is 7,200 gallons a day, but it is found to be deficient in quantity. It was stated to us that the well would yield a much larger supply were the suction pipe lengthened about thirty feet. This should be done in order to complete the works, on which a considerable sum of money has already been spent without obtaining a sufficient quantity of water for the daily supply of the troops.

All the buildings are drained by glazed earthenware pipes, carried outside the walls. There is a very small fall only for discharging them, and as the supply of water is deficient, they are liable to become obstructed. Several gulley grates are untrapped, and give off foul air close to the barracks.

These defects should be remedied. All gulley grates should be trapped; but in doing this, provision should be made for ventilating each line of sewer by a pipe carried up to a sufficient height to diffuse the foul air at a sufficient distance from inhabited buildings. Each line should also have means of flushing from the higher end. This provision will probably be always required on account of the very small available fall.

There are 12 sets of open privies belonging to the new barracks, undrained, and connected with cesspits behind the buildings, which are emptied periodically. All the objections which we have repeatedly urged against the use of cesspits in confined barrack enclosures, on account of infiltration of the subsoil and pollution of the air, apply with greater force in such cases as the present, where the difficulties of draining the subsoil are so great.

We should certainly advise water latrines to be substituted for these privies as speedily as possible, the cesspits to be filled up, and proper drains to be laid down, through which the latrines could be flushed daily into the sea.

There are two latrines at the old barracks, which are drained by earthenware pipes. All should be drained and all provided with Macfarlane's latrines, or any other form equally economical of water.

The urinals are of stone, and are not of good construction. Improved slate urinals with sufficient water for cleansing should be substituted on the first opportunity for the present ones.

The guard-room of the new barrack is very deficient in ventilation, and all the windows except one are incapable of being drawn down at the top. There are four small and inefficient openings in the ceilings. This guard-room requires roof ventilation on Mackinnel's or Muir's plan, a remodelled fire-grate, and the top sashes of all the windows to be properly hung.

There is a privy, ash-pit, and cesspit at the end of this guard-room, which ought to be removed; and a dust box, a water latrine, and urinal substituted.

The guard-room at the old barrack has a remodelled grate, but no outlet. It also requires a roof ventilator.

The adjoining cells are not sufficiently ventilated, and they were filled with sulphureous vapour at the time we were there, from a defect in the stove pipe. Two of the cells are quite dark. More ventilation through the roof is necessary to keep these cells healthy.

The three guard-rooms of Sheerness barracks are among the exceptional cases in which a sufficient space per man has been given. At the time the return was made to us the men in the main-guard had 576 cubic feet each; those in the barrier-guard 593 cubic feet; and those in the barrack-guard 787 cubic feet per man.

We have already alluded to the canteen. It is in a ruinous condition and much too far away from the new barracks. A new canteen is evidently much required, and the rooms in the present one should be ventilated by Arnot's valves and perforated glass panes.

There are no special married quarters attached to these barracks, but, as already stated, accommodation for married soldiers has been provided in the old barracks. It is not good, but it is perhaps better than could be obtained in the town.

There is a thoroughfare through the barracks to the entrance to the dock-yard, which is complained of as inconvenient and prejudicial. It is proposed to run an iron fence from the dock-yard gate to the barrier-guard to keep out improper characters.

Considered as a whole, these barracks ought not to be unhealthy merely as buildings. It is their local position which causes so much ague among the troops. We were informed that the inhabitants are very desirous to improve the sanitary condition of Blue Town and Mile Town, and that they will proceed with the works as soon as the necessary preliminaries are completed. It is proposed to drain both towns and to conduct the sewage to the shore of the Medway, where it is proposed to place a pumping station to raise the sewage to a sufficient height for discharging it into the estuary.

The point at which it is proposed to place this pumping station is much too close to the hospital, and we have therefore recommended its being placed further away, a change which can be effected with ease.

When these towns are drained, paved, regularly cleansed, properly supplied with water, and the various stagnant pools and ditches, not forming part

of the defences of Sheerness, are drained or filled up, the general atmosphere of the vicinity will no doubt be improved, and the station rendered more healthy than it is at present; but Sheerness will not be so free from intermittent fevers as it ought to be from its open airy position on the sea-shore, until drainage works are carried out, not for the towns only, but for the whole district, similar to those which have in other parts of England not only banished ague, which was formerly as prevalent in those districts as it is in the Isle of Sheppey, but which have, at the same time, added immensely to the value of the land itself.

The present undrained state of the banks of the Medway can only excite surprise in the mind of any one at all conversant with what has been done elsewhere.

Sheerness barracks themselves, as we have shown, require various sanitary improvements, which we beg to sum up as follows:—

1. Reduction of the numbers of men in each barrack-room to give 600 cubic feet per man.

2. Ventilation of all the barrack-rooms by shafts and inlets of the usual construction. In all cases where fresh air for supplying the room fire-grates is taken near the surface of the ground, provision to be made for obtaining the air several feet at least above the surface, and at a distance from gulley grates.

Ventilation of the staircases by shafts through the roof, and perforated glass panes in the windows. Non-commissioned officers' rooms to have Arnott's valves in the chimneys. Ventilation of the guard-rooms by Mackinnel's or Muir's ventilators through the ceiling. Additional ventilation of the cells and school-room; tailors' shop to have shaft and inlet; armourers' shop and one woman's wash-house to have louvres in the roof. Canteen tap and non-commissioned officers' rooms to have Arnott's valves and perforated panes.

3. Ablution-rooms to be provided with pegs. Present bath to be better separated from the ablution-room, and six additional baths to be provided.

4. Women's wash-houses to have drying stoves. Wash-house at the old barracks to have fixed tubs, gratings, and drying stove like the other wash-houses.

5. Water supply to be increased.

6. All privies to be reconstructed as water latrines, supplied with water and drained; to have divisions of seats, half doors, and more light and ventilation; cesspits to be abolished. Better urinals, supplied with water, to be provided.

Means of flushing the main lines of drainage to be provided.

All gulley grates to be properly trapped.

### *Sheerness Hospital.*

This is a new hospital only recently occupied. Its position is open and airy, and it would be healthy were it not for the generally malarious condition of the surrounding atmosphere, and the low level of the site, which is several feet below that of high tides.

The buildings are in a single range, two stories high, with windows along one side. There is a central entrance passing through the buildings, and terminating in a closed corridor, which extends the whole length of the range. At each end of this corridor there is a staircase, giving access to a similar corridor above. On the ground floor are a number of rooms used chiefly as stores, ablution and bath rooms, surgery, medical officers, and orderlies' rooms.

Behind these, and opening out of the corridor, is the kitchen. The upper flat of the hospital is occupied by wards and a day-room.

There are, altogether, 11 wards, with hospital accommodation for 103 sick at from 667 to 723 cubic feet per bed. The following table gives the details as regards each ward in comparison with what the accommodation would be at 1,200 cubic feet per bed:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| Nos. | | | |
| 1 | 9 | 5 | 4 |
| 2 | 9 | 5 | 4 |
| 3 | 9 | 5 | 4 |
| 4 | 11 | 7 | 4 |
| 5 | 11 | 7 | 4 |
| 6 | 9 | 5 | 4 |
| 7 | 9 | 5 | 4 |
| 8 | 9 | 5 | 4 |
| 9 | 9 | 5 | 4 |
| 10 | 9 | 5 | 4 |
| 11 | 9 | 5 | 4 |
| Total - | 103 | 59 | 44 |

In order to give, as nearly as may be, 1,200 cubic feet per bed, it will be necessary to remove four beds from each ward, leaving 59 beds as the available hospital space.

The wards are of three lengths, 25 feet, 25 feet 4 inches, and 25 feet 6 inches; they are all 20 feet in width. Nine of them are 12 feet high, and two are 15 feet high. These last are on the ground floor. Taken as a whole, these wards are of good height in proportion to their other dimensions; but the advantages which ought to be derived from this circumstance are to a great extent neutralized by the fact that the wards have no more than two windows each, that these windows are at one end of the ward, that at the opposite end the ward door opens into the corridor already mentioned. An arrangement by which thorough ventilation is rendered difficult or almost impossible, while the beds are ranged along the dead walls instead of being placed between the windows.

Some provision has been made for ventilation by carrying two four-inch tubes from the centre of the ceiling of each ward to the wall, and thence up in the thickness of the wall to above the roof. Two inlets for fresh air are placed close to the floor, and there is an opening into the corridor over the ward door.

The inlets are placed in the wrong position, and should be removed to the top of the outer wall, close to the ceiling. Cold air should not be allowed to pass over the floor of a sick ward or barrack-room. It cools the floor, and cools the air round the men's feet, at the place where the air ought to be warm. The outlet shafts are much too small, and as the current is bent at two right angles before reaching the outer air, the ventilating effect of the shafts is materially impaired.

We would leave these shafts as they are; but in addition to them, we would propose to carry a square shaft of the ordinary area and construction from one of the corners of each ward most distant from the windows, above the roof; or, if it can be done more economically, one or both of the existing shafts might be enlarged to the required sectional area, and made to open at the angle between the ceiling and wall by an aperture double the sectional area of the shaft. By either plan the up current would be increased to a sufficient degree to keep the ward air pure. At the time of our inspection, partly from overcrowding, partly from these defects in the ventilation, the wards were close and unwholesome.

The ward fire-grates were being remodelled on our plan, to warm part of the admitted air, and hence by the slight change we have advised these hospital wards will be effectually ventilated as far as their structure admits of it.

The corridors are warmed by stoves, but they require ventilation by louvred shafts in the length, carried through the ceiling and roof; or by louvred

skylights in the upper corridor and inlets of the usual construction close to the ceiling.

There is an ablution-room on the ground floor of the main building. It is fitted up like an ordinary barrack ablution-room, with slate tables, and regulation basins. A proper hospital ablution table, with small fixed basins, would be a great improvement, by diminishing the extent of wet evaporating surface exposed within the hospital by the present arrangement.

There are two baths adjoining the ablution-room. They have hot and cold water laid on.

There is a small hospital wash-house, with drying room adjoining, outside the main building.

Behind the hospital, and entering from the back of the corridor, is a large kitchen with a scullery attached. It is sufficiently supplied with means of cooking.

Water is derived partly from the deep well which supplies the barracks, and partly from rain water; the latter is used for the water-closet cisterns.

The buildings are drained by earthenware pipes into the general system of barrack drainage, such as it is, but the fall is very defective, for reasons already stated. There are water-closets within the building on Jennings' self-acting principle, and a double closet in the enclosure behind the hospital.

There is a provision store, pack store, and a medicine store, but there are no other stores. A bedding store is stated to be much required.

A hospital serjeants' quarters, consisting of a sitting-room, bed-room, and kitchen, has been provided on the basement floor, as also a room for orderlies, but orderlies nevertheless sleep in the wards among the sick. The general structure of the building does not admit of orderlies' rooms being so placed as to keep up a proper oversight of the sick by day and night, and hence the orderlies have to sleep in the wards.

One very good feature in the building is a large day-room for convalescents. It is entered from the upper corridor. It is 30 feet 4 inches long, 20 feet 9 inches broad, and 12 feet high, and no doubt is of great importance to the comfort of convalescents.

Sheerness hospital is, we believe, the latest constructed military hospital now occupied in Great Britain. Its general plan and arrangements are not good; the construction is too complicated. There are too many unventilated places and corners within it. The ward construction is faulty, and the arrangement of beds is not in accordance with sound sanitary principles. The plan has, in fact, been sacrificed to the means of access, viz., the corridor, and although the building when seen from without has a certain appearance of spaciousness and neatness, within it has certainly not the attributes of a good hospital.

*It requires Sanitary Improvements in the following Points:—*

1. Four beds should be removed out of each ward.
2. Each ward requires ventilation by a shaft and inlets. The shafts to be provided in one of the ways mentioned; the present inlets near the floor to be built up.
3. The corridor to be ventilated by shafts or by ventilating sky-lights.
4. An ablution table with fixed sunk basins, and hot and cold water laid on to be provided.

JOHN SUTHERLAND.

DOUGLAS GALTON.

June 1860.

---

# SOUTH-EASTERN DISTRICT.

SIR,

HAVING completed our inspection and inquiry into the sanitary condition of the barracks and hospitals of the South-eastern district, we have the honour to report the result as follows:—

The barracks which we have inspected in this district are,—

1. The Hut and Royal Artillery Barracks at Shorncliffe.
2. Hythe.
3. Dover, Western Heights.
4. Dover Castle.
5. Walmer.
6. The Royal Naval Hospital, at present used as an infantry barrack, at Deal.
7. Canterbury.

We shall report on each of these stations separately.

## 1. SHORNCLIFFE CAMP.

The camp at Shorncliffe occupies a plateau about 220 feet above the level of the sea, and overlooking it at 1,000 yards distance.

It covers an area of about 120 acres. The soil consists of sandy loam. It has every natural facility for drainage, and is completely isolated from civil population. The site is exposed freely to the sea breeze, and is a very healthy one.

The huts are arranged in double lines, enclosing an extensive parade ground in the centre. They are separated a sufficient distance from each other to allow of a free circulation of air, and the general arrangement of the camp is good, so far as it is calculated to secure the health of the troops.

The surface drainage of the ground about the huts is effected by drains carried along between the lines of huts, with trapped gullies at intervals, by which the surface water is finally conducted to the sea, without passing under any of buildings or huts in camp.

Water used formerly to be obtained from superficial wells, but the whole of the camp is now supplied from the main of the Folkestone Waterworks; as, however, the level is not sufficiently high, the water from the main is thrown up by an 8-horse power steam engine to a further height of 150 feet into a tank capable of holding 45,000 gallons, from whence the water is distributed by pipes to the camp and hospital. The arrangements for water supply appear to be good, but the quantity available is stated to be no more than sufficient for present purposes, so that there would be little or none to spare for water latrines or for flushing sewers.

There are 192 soldiers' huts with regulation accommodation for 25 men in each, or for 4,800 men in all. At the time of our inquiry the average number of men in the infantry huts was 22, and in those of the royal artillery 20.

Each hut is 38 feet 10 inches long, 20 feet broad, and 11 feet high to the ridge. The cubic contents of each hut are 8,360 feet, giving 334 cubic feet for each of the 25 inmates, and 380 cubic feet for the present number, which is 22.

Each hut has 10 windows, two fanlights, and two doors. There is a louvred ventilator at each end, and three ventilators in the ridge of each hut.

These provisions for light and ventilation, together with the pervious nature of the wooden walls of the huts, ought, in our opinion, to be sufficient to keep the air in the huts in a comparatively pure condition, even at night, if the regulation number of inmates be somewhat reduced, and if the ventilators are properly made use of and not interfered with by the men.

We are further of opinion that for the same reasons, and also on account of the excellent principle exemplified in hut barracks, of dividing the men into

a number of detached buildings, with a small number of men in each, it is not necessary, so far as health is concerned, to set apart 600 cubic feet per man, as must be done in permanent barracks.

The principle of subdividing the force among no fewer than 192 separate barracks, so to speak, with air freely playing round them, and ample means of ventilation, makes 400 cubic feet per man of as great a value in preserving health as 600 cubic feet has in a large permanent barrack.

Twenty-five men per hut are, however, too many. The present number, 22 men per hut, is better, but we would prefer that the cubic space at present allotted to the royal artillery, who have 20 men per hut, should be adopted as the limit of accommodation for all the huts in camp.

There are five serjeant-majors' quarters, consisting each of room, closet, and kitchen; five quarter-master-serjeants' quarters with two rooms to each, and 20 staff-serjeants' quarters, two of which are in a room.

The staff-serjeants' quarters are not sufficient, considering the position of these officers.

There are 80 married quarters, but the proportion is below the number allowed for such a force. It would be advisable to increase this accommodation if practicable. At present, no fewer than six separate families are lodged together in a single hut, an arrangement at variance both with health and decency.

The soldiers' huts are warmed by stoves, which are stated to be dangerous, and to require constant repairs. For permanent use, fire-places would be more economical and healthy, as well as safer.

The latrines and urinals are both in the same building. The former consist of iron tanks, in which the soil is deodorized, and removed nightly by the "Cyanic Manure Company." There was some smell in the building when we inspected it, but it was partly owing to the position of the urinals.

In our opinion it would be advantageous to remove these urinals outside the latrines, and to give them the advantage of free circulation of air, which would greatly lessen the effluvia from them.

It would be a better arrangement altogether to substitute water latrines, with flushing arrangements; but it is doubtful whether there would be at present a sufficient supply of water for the purpose, while, if due care be used in deodorizing and removing the soil regularly, we do not think that in so open and airy a locality any injury to health is likely to arise from the present arrangements.

The nuisance, such as it is, may, however, be materially diminished by removing the urinals as already recommended.

There are 20 cook-houses, four in each range.

The kitchen arrangements are undergoing improvements. Two new forms of cooking range, those of Captain Lemprière and Captain Grant, have been introduced, and are on trial. Both ranges contain baking ovens, in addition to the customary boilers. We shall delay expressing any opinion on these cooking ranges, until sufficient time has elapsed to admit of their being fully tried.

There are 10 ablution-rooms, two for each range of huts. Each room has 22 water taps, and is well supplied with basins. There are no gratings for the men to stand on. The benches are of wood, and the method of draining the water from the surface of the bench is not very good.

Gratings should be supplied, and if the camp is to be used for any length of time, it might be advisable to substitute slate benches for wooden ones, or at all events to improve the method of draining off the water when the basins are emptied, by providing a gutter for the purpose.

There are no baths in the camp; the chief difficulty in the way of introducing them is the deficiency of water for such purposes. But this deficiency admits of being supplied, or well water might be raised on purpose from the existing camp wells. About one bath for every 100 men would be required.

There are five wash-houses, one to each range, with six coppers, and water laid on in each; but there are no drying stoves. The barrack-master considers that great advantage and economy might be realized from providing a large establishment in which soldiers' wives could wash the barrack and hospital bedding. But at all events drying stoves and means of ironing linen should be provided for the existing wash-houses.

The means of lighting are at present described as very imperfect. It would be a great improvement to introduce gas, provided the camp is to be permanently occupied.

There is no proper library and reading-room. The present library consists of a single soldier's hut, which has been temporarily set apart for the purpose. It would be a great advantage to provide more suitable and more extensive reading accommodation for so large a number of men as are congregated in this camp. There is a very good site where a library and reading-room might be erected.

There are no workshops, sheds for drill, cleaning rooms, or day-rooms.

The ventilation of the prison cells is not sufficient, and the prison latrine requires to be deodorized and emptied at shorter intervals.

The coal sheds are open above, and it is alleged that the coal deteriorates from exposure to the weather.

We have stated the chief defects which have been brought under our notice with regard to Shorncliffe camp. Many of them refer to matters affecting the comfort and well-being of the soldier, rather than his health. They are all worthy of consideration, with the view to being remedied if the camp is to be continued.

*The immediate recommendations we desire to make are few in number, and are as follow:—*

1. Introduction of means for baking or roasting meat into all the kitchens.
2. Introducing wooden gratings in all the lavatories, and pegs for hanging coats on where required. Also improving the means of removing the water from the surface of the tables.
3. Introduction of baths in the proportion of one bath to 100 men, and increasing the water supply for the purpose.
4. Removal of urinals from within the latrines to the open air.
5. It would be a great advantage to provide suitable day-rooms and drill sheds, and a larger library and reading-room.
6. The married quarters should be extended to make the accommodation commensurate with the regulation number of married people, and huts set apart for married people ought to have suitable divisions between the parts allotted to different families.
7. Every wash-house to be provided with a drying stove and means of ironing linen.
8. Better ventilation of prison cells and better arrangements for deodorizing the prison latrines.
9. Regulation numbers in the infantry huts to be reduced to 22 men per hut at the least.

## 2. ROYAL ARTILLERY BARRACKS, SHORNCLIFFE.

These barracks are built of brick, and were erected in 1801. They have regulation accommodation for 104 men.

There are eight soldiers' rooms, with a cubic capacity of 6,120 feet each, and as each room holds 13 men, the space per man is about 470 cubic feet. Each room has a window back and front, but there are no independent means of ventilation. A ventilating shaft carried up from the ceiling of each room, with means for admitting fresh air near the ceiling, would afford the necessary remedy.

The privies in the barrack are in a very bad condition, and require reconstruction. They consist of a long trough, with a ladder on the top. There is a lean-to roof over this, but no other separation from the open air. The urinal is small and without water; it was offensive. The privies ought either to be converted into water latrines and drained, or else an arrangement of iron boxes with suitable means of deodorizing ought to be adopted as in the hut barracks.

The urinals also require improvement.

One of Lemprière's cooking ranges was being introduced into the kitchen at the time of our inspection. The lavatories are tolerably good, but there are no baths. Two should be provided for the purpose of cleanliness.

The rooms are rather crowded, and ought to have no more than 11 men in each.

*We would recommend, therefore, in regard to this Barrack:—*

1. Ventilation of each room as already pointed out.
2. Reduction of numbers to 11 men in each room.
3. Improvement in the privies and urinals as pointed out.
4. Two baths to be provided.

*Shorncliffe Hospital.*

This hospital is situated on a steep hill slope towards the sea, and considerably below the level of the camp.

It consists of five parallel ranges of wards and offices, of wood and brick, built on terraces cut out of the hill slope, rising rapidly one behind the other.

Each range for sick consists of wards opening out of narrow corridors, which in some instances face towards the sea, and in others towards the hill side. All the ranges are connected by means of a wide wooden staircase roofed with corrugated iron, extending from the upper to the lower range of buildings. Each range contains six wards opening out of the corridor, which is 150 feet long and 5 feet broad. The wards, therefore, have windows to the open air only on one side. Each ward is intended to accommodate 10 sick, so that no more than 60 sick are under one roof, and the cubic space per bed amounts to 700 feet, exclusive of the corridor. From the pervious nature of these hospital huts, their exposed airy situation, the small number of sick treated under one roof, and the temporary character of the hospital, we do not consider it necessary to recommend any further increase of cubic space than can be given by maintaining as equal a distribution of the sick among the huts as may be possible.

Ventilation is effected by windows, and by a ventilator in the roof. The Deputy Inspector-General in charge states the ventilation to be sufficient.

The hospital is well supplied with lavatories and baths, and also with kitchen arrangements.

The chief removable defect in this hospital is the want of a suitable exercising ground for convalescents.

There are the means of supplying this at hand, as there is enough of unoccupied ground.

It simply requires levelling, and suitable paths, seats, and fencing to be provided.

There is at the present time no hospital accommodation for the sick wives and children of soldiers, and there is no accommodation for lying-in women. The sick are attended in camp, and the lying-in women are received into a small house at a distance from the camp, which renders attendance on such cases very inconvenient to the medical officers.

The Deputy Inspector-General proposes to set apart a vacant hut in the uppermost range of the hospital for sick women and children, and he further proposes that an additional hut be erected on the hill slope above the sick-hut for lying-in women.

The proposed arrangement appears to us to be good, and we would recommend its being adopted.

*We would recommend for this Hospital:—*

1. That a suitable exercising ground, with covered seats for convalescents, be provided.
2. That hospital accommodation be provided for sick women and children, and for lying-in women, on the site pointed out by the Deputy Inspector-General.

## 3. HYTHE BARRACKS.

These barracks were originally erected for the staff corps. They are now used as a school for musketry. The barrack-rooms are in two blocks, and are situated on flat ground at the foot of a sloping field, from the drainage of which much of the water for the barrack is derived.

The rooms are tolerably lofty, with windows at each end, and a fire-place in the centre, on the side next the door.

The joists of the floor are bedded in the ground.

All the rooms have a hollow beam traversing the ceiling from back to front, and communicating with the external air at each end. The beam is perforated with openings near its middle, to admit of some degree of ventilation taking place; but the ventilation is insufficient in amount for the size of the rooms, and the number of men, and might be readily improved by carrying up a shaft from the ceiling of each room to the roof of the building, by making inlets for air, and by altering the windows to make them open at top, which is not the case at present.

The following is the accommodation in this barrack in comparison with what it would be at 600 cubic feet of space per man, which we are required to allot by our instructions:—

| Rooms. | Regulation Number of Men per Room. | Total Regulation Number of Men. | Men per Room at 600 Cubic Feet each. | Total Number at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|---|---|
| 6 | 20 | 120 | 15 | 90 | 30 |
| — | 20 | 100 | 13 | 65 | 35 |
| 1 | 20 | 20 | 13 | 13 | 7 |
| Kitchens— | | | | | |
| Nos. 1 to 6 | 4 | 24 | 4 | 24 | — |
| No. 7. | 4 | 4 | 3 | 3 | 1 |
| Total - - | — | 268 | — | 195 | 73 |

The rooms do not admit of being divided into equal spaces of 600 cubic feet each; and considering that there are no buildings near the barracks, we have calculated the amount of cubic space in the above table somewhat below 600 feet, so as to accommodate as many as possible.

The regulation number exceeds the accommodation by above 73 men.

There are 27 rooms, arranged like cottages, which have been long used as married quarters. The rooms are small and not well ventilated, and there is no thorough draught across them from back to front; but notwithstanding these defects they exhibit a favourable specimen of the kind of accommodation provided at the period of their erection. The ventilation of the rooms might be easily improved by introducing an Arnott's silk flap ventilator into each chimney, near the ceiling.

There is a long narrow lean-to building, used as a lavatory for the barracks, with a bench, basins, and water laid on, but there are no baths, although accommodation might be found for two at the end of the ablution-room. There are no pegs for hanging coats.

The cook-house is dark and small. It has eight boilers, but no means of roasting or baking meat.

The meat-house requires ventilation.

The latrines are at some distance from the barracks, and there is no shelter for men going to them in wet

weather. They are flushed into the neighbouring canal by a stream of water passing through them. There are no divisions or half doors. The former might be easily supplied, but there is not space enough for the latter. There is no separate latrine for non-commissioned officers.

The urinals are close to the barracks, but they are not supplied with water.

The barracks are drained by a barrel drain, and the inlets are generally trapped. The surface drainage of the back yard is, however, very imperfect on account of defective paving. This admits of easy remedy.

There are no day-rooms, cleaning-rooms, covered shed for drill, mess-room for non-commissioned officers, nor accommodation for pursuing trades on the construction of the building.

There is no proper laundry belonging to this barrack. There is only a women's wash-house, situated at the soldiers' barracks, and at a distance from the married quarters. There is a space of ground near the married quarters, with an adjacent water supply, which would afford the means of erecting a convenient and suitable laundry.

The water supply is derived from a spring in the field behind the barracks. There are also rain-water tanks. For washing purposes the water is raised from the canal, which receives the drainage of the barracks and also that of the neighbouring town of Hythe. This canal is stagnant, and during every summer it gives off offensive effluvia. There can be no doubt that some steps should be taken to remove the nuisance, either by cleansing, or if possible by renewing the water in it from time to time, and diverting the drainage out of it.

The guard-room of these barracks is in the centre building. It is low-ceiled, dark, and imperfectly ventilated. The cells adjoining are cold and damp.

*The following are the Requirements for Health:—*

1. Ventilation of barrack-rooms by hanging all the windows so as to open at top, and by shafts carried up from the ceiling of each room to the roof of the building, with proper inlets for air. Ventilation of the guard-room in a similar manner. Ventilation of the meat-house.

2. Reduction of numbers of men in the rooms to the extent stated above.

3. Repair of pavement and guttering in back yards, and improvement in the surface drainage.

4. Two baths to be provided with water laid on, and pegs in the lavatory for hanging coats.

5. Cook-house to be provided with means of roasting or baking meat.

6. Privy to have the seats properly divided, and urinals to be supplied with water for flushing.

7. Improved laundry to be provided.

8. Each room in the married quarters to be ventilated by an Arnott's silk flap ventilator into the chimney.

These requirements are of the most immediate importance to health, but the other defects mentioned above, namely, the state of the canal; the want of drill sheds, workshops, non-commissioned officers' mess-room, day-room, cleaning-room, and the condition of the prison cells should be remedied as soon as possible.

### *Hospital, Hythe.*

This building is situated close to the barracks. It contains four wards, with regulation accommodation for 36 beds.

There are two wards, numbers 1 and 4, each having 12 beds; and two wards, 2 and 3, with six beds in each. In the two larger wards the cubic space per bed is 634 feet, while in the two smaller wards it is 585 cubic feet per bed.

The average cubic space per bed is therefore less than one-half of what we are required to set apart by our instructions.

The wards are ventilated by hollow beams, in the same manner as the barrack-rooms, and recently the windows have been hung to draw down at top.

There are two water-closets within the building, to which the water is supplied by taps. The arrangement is not a good one, and soil-pans of improved construction would be better.

There is a privy in the hospital yard, periodically flushed, but it is offensive, and requires improvement. The urinal is under the same roof as this privy, and is not supplied with water.

There is no ablution or bath room belonging to the hospital.

The kitchen is not well supplied with the means of cooking. The grate is insufficient.

The only entrance to the building is by a narrow doorway through the surgery at the end of the building. The proper door of the building has been closed up, and might be reopened with advantage, provided an outside porch were added to it.

*The following are the Requirements for Health:—*

1. Additional ventilation of the wards by shafts from the ceilings to the roof, and inlets for air. Front door to be reopened.

2. Reduction of number of beds to half their present number. This could easily be done. The average force at the barracks is 233, which ought never to yield sick enough to occupy 36 beds at one time.

A safe rule would be to distribute the current sick as equally over the space as possible, and if this were done, and the extra beds removed, it is very probable that each patient would have about 1,200 cubic feet of space.

3. Kitchen range to be improved or replaced by a better one.

4. Water-closets to be improved. Urinal and privy in the yard to have a better water supply and more frequent flushing.

5. Lavatory and bath-room with fixed bath, and hot and cold water to be provided.

## 4. DOVER.—WESTERN HEIGHTS.

The barracks and casemates on the western heights at Dover are all situated in open, airy, and lofty positions, removed from the civil population of Dover, and having the sea breeze freely sweeping round and over them. The sub-soil is chalk and self-draining, and even in the casemates hollowed out of the rock, there was not that amount of dampness when we inspected them which their position would have led us to anticipate.

The access to the barracks from the eastern side of the town is by means of a shaft, at the foot of which is situated a guard-house.

This guard-room has no ventilation, and is too small for discipline, as it is required to hold the prisoners taken by the picket in the town, and also the picket itself, which is a strong one. It is stated that a sufficient addition to it would cost 600*l.*

The privy belonging to this guard-house is very defective and offensive; it requires to be reconstructed with divisions and doors; it is occasionally flushed, but water does not stand in it. As there is a sufficient supply of water, it should be converted into a proper water latrine, and flushed out either once or twice a day, as might be required. The space occupied by the privy is very narrow, and in order to keep the back clean, an arrangement, similar to that in the privy of the hospital of the castle barracks, should be adopted, viz., a perforated pipe running along the back of the seats with water turned on in the manner done with the water supply of urinals.

The drainage from the latrines of the Western Heights barracks is brought down into the town sewers by a vertical pipe close to the shaft and stair,

and when the privies are flushed, the mass of water falling suddenly down this pipe from so considerable an elevation, causes the sewer gas to force the traps, and escape into the houses in the town, and into the shaft of communication between the town and the Western Heights. The regular flushing of the barrack privies above is hence impracticable on account of the nuisance occasioned by it.

To obviate this it would be necessary to form a large tank at the bottom of the shaft, capable of holding the greatest quantity of sewage that would be sent down at a flushing, with a trapped pipe leading into the town sewer; from the top of the tank an open pipe of sufficient dimensions would have to be led half-way up the cliff outside, to allow the displaced gas to escape. The flushing of the barrack privies would fill the tank, and the foul air in it would escape up the air pipe provided for the purpose. The tank would then empty its contents slowly into the town sewers, and the nuisance would be avoided.

Troops are accommodated on the Western Heights in the following barracks:—

1. Western Heights barracks.
2. Drop redoubt casemates.
3. Citadel, comprehending,—
   - Long casemates.
   - Short casemates.
   - South lines.
   - West face casemates.

### Western Heights Barracks.

These barracks were erected about the beginning of the present century. They consist of two parallel blocks, of which the front range is three stories high, and the rear range four stories. The lower story in the rear range is occupied by ablution-rooms, stores, cooking houses, &c.

The front range has detached cook-houses, ablution-rooms, and urinals in the rear, separated from the buildings by a passage only a few feet in width.

The following table represents the accommodation in the Western Heights barracks according to present regulations, and also what it would be if 600 cubic feet of space were allotted to each man:—

| Rooms. | Regulation Number of Men per Room. | Total Regulation Number. | Number of Men per Room at 600 Cubic Feet each. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation. |
|---|---|---|---|---|---|
| 51 | 21 | 1,071 | 16 | 816 | 255 |

To give 600 cubic feet per man, it would therefore be necessary to remove five men out of each barrack-room, and to provide additional accommodation for 255 men.

The barrack-rooms are all alike; they run through the building from front to back. They are tolerably lofty, and have windows at each end. The main defect in their structure is that the wooden staircases, giving access to the different flats, are all taken off from one end of the barrack-rooms, hence the rooms are not so light as they might be, because the windows at one end are blocked up by the staircase, as well as by a partition enclosing a small berth for a non-commissioned officer. If the non-commissioned officer is married, his wife uses the barrack fire for cooking.

The barrack-rooms have no ventilation. To remedy this defect, shafts should be led up from one corner of the ceiling through the roof, and as the ceilings are covered with plates of zinc, the best plan for supplying fresh air would probably be to admit air between the zinc ceiling and the floor above, at the ends of the room, and to perforate the zinc with numerous small holes, about one-eighth or one-sixth inch diameter; these holes should be most numerous towards the centre of the room. By this plan, the air might be preserved sufficiently pure without draughts.

There is no place for keeping cleaning materials or utensils, and hence the mops and urine tubs are collected together during the day at one end of each room, and give rise to unpleasant smell in the rooms. This is a very common evil in barracks, only to be remedied by the introduction of improved urinals.

Gas is provided for these barracks in this year's estimates.

The ablution-rooms are good, and have pegs and wooden gratings for the men to stand on, but there are no baths. These are required in the proportion of one bath for every 100 men. At the back of the rear range there is an ablution-room, which might be converted into a bath room. If these rooms will not afford the required space, a bath room should be built.

The kitchen in the basement of the rear block requires one or two shafts to be carried up through the roof to ventilate it, and perforated panes of glass to afford inlets for air.

The kitchen is supplied with boilers, but there is no oven or means of roasting meat.

The urinals are at the back of the barrack, and are of slate. The space which they occupy is rather confined, and water should be laid on. These urinals are ventilated by louvred windows on the side facing the barracks. They require openings in the wall close to the roof on the other side, in order to afford through ventilation, and to carry off the smell from the barrack windows.

In the area at the back of the barracks, there are drains which are used for emptying slops, &c., which require to be trapped, as also all the rain-water drains in this neighbourhood.

The privies are at some distance from the barrack-rooms. They are in a court together with the urinals. The privies are in a spacious covered building, the seats being placed back to back, and slate divisions being carried to a height of four feet from the ground.

Water for flushing these privies is obtained by collecting the drainage of lavatories and urinals in a tank. Although this tank is at a distance from buildings, the putrescent fluid it contains adds unnecessarily to the nuisance of the latrines. A proper water supply ought to be laid on to the flushing tank as is the case in other barracks, and the present practice discontinued.

In consequence of the difficulty of drainage alluded to, these latrines are rarely flushed at present. When this defect has been remedied, arrangements should be made to keep water continually standing in the receptacle, and to flush them once or twice a day.

The water supply is derived from a deep well, from which it is pumped up by a steam-engine in the citadel, and distributed to the whole of the buildings on the heights.

The whole of the barracks are drained. The storm waters are conducted directly into the harbour, and the other drainage into the town sewers, as already mentioned.

There is a good fives-court close to the privies.

The ablution-room of the front range of barracks is at the back of the barracks. It is narrow, but otherwise complete, except that baths are required.

The cook-house belonging to the front range is placed at some little distance from the barrack. It is confined and small, and has only boilers, no means being provided for baking or roasting meat.

The refuse of the barracks is collected and kept in uncovered ash-pits until it is removed. These ash-pits should be abolished, and the refuse collected and removed daily in an iron cart.

The women's wash-house is small, and requires a drying stove. It is in contemplation, we believe, to construct a proper laundry in connexion with the proposed married quarters; but until this laundry is completed, it will be necessary to provide a drying stove for each wash-house on the Western Heights.

The canteen is close and small for the number of

men it has to accommodate, and would be improved by ventilating glass panes in the windows.

Above the canteen is a room intended as a reading and coffee room for the men, which requires similar ventilation.

The serjeants' mess-room is good, but also requires ventilation by means of a shaft and inlets for air.

The library requires ventilation in a similar manner.

The staff-serjeants' quarters are very good.

There are no cleaning-rooms, or covered sheds for drill, and no workshop, except one tailor's shop.

The regimental guard-room requires ventilation by a shaft and inlet for air.

The existing cells should be moved to the tailor's shop, in order to be close to the guard-room, and the tailor's shop placed where the cells are. A water latrine and urinal is required for this guard-room.

*The following are the Sanitary Requirements for the Western Heights Barracks :—*

1. Ventilating all the barrack-rooms, guard-rooms, canteen, serjeants' mess-room, library, urinals, &c., in the manner pointed out.
2. Reduction of numbers of men in barrack-rooms.
3. Construction of water latrines, improvements in connecting the Western Heights drainage with the town drainage, and trapping of all untrapped gulley grates, as recommended. Urinals behind the back range to be ventilated, and to be supplied with water as described.
4. Kitchens to be supplied with means of roasting and baking meat.
5. Laundry and drying stove to be provided for wash-house.
6. Barrack refuse to be collected and removed in iron carts..
7. Bathing accommodation to be provided as described, in the proportion of one bath to 100 men.
8. Guard-room at the foot of the shaft to be enlarged and ventilated, and the adjoining privy converted into a water latrine, as recommended.

Lastly, a drill shed, a day-room and cleaning-rooms, as well as workshops, ought to be provided with as little delay as possible.

### Drop Redoubt.

This redoubt is occupied by a company of artillery; it contains three casemated rooms, each accommodating by regulation 25 men, and one casemate for married people. It is provided with a slated roof and a passage all round outside, so that the rooms are remarkably dry.

They are built of the parabolic form, are lofty, and have windows at both ends, but they have no means of ventilation except by the windows. Ventilation should be provided by a large Arnott's silk flap ventilator into each chimney, and by inlets for air through perforated panes, or otherwise. Reconstructing the grates to warm the admitted air during winter would be a great advantage. The outside doors are protected from the weather by a shed.

The cubic space per man varies from 443 in the men's, to 675 cubic feet in the married quarter, which latter, however, is the amount provided for a family. Considering the small number of men in these casemates, and their airy exposed situation, as also their structure, we do not think it necessary to recommend reduction of numbers, until at least the proposed ventilation has been tried.

The ablution-room is very small, and not sufficiently lighted ; there is a grating for the men to stand on, but no pegs for hanging coats on. The water is obtained from pump.

The urinals have no constant supply of water. The privies are provided with means of flushing, but they should be converted into water latrines ; they also require divisions and half-doors, and ventilation should be provided through the roof.

The guard-room and lock-up place belonging to the drop redoubt are small, dark, and imperfectly ventilated. We understand it is proposed to reconstruct them on a better plan.

*We would therefore recommend for the Improvement of these Barracks :—*

1. Ventilation of the rooms in the manner described.
2. Converting the flushed privies into water latrines, ventilating them through the roof, and supplying the urinals with water for occasional flushing.
3. Pegs to be placed in the lavatory.

The proposed reconstruction of the guard-room and lock-up ought to be proceeded with.

*Chapel School on the Western Heights.*

This is an excellent building for its purpose, but it requires ventilation, which might be easily afforded, to some extent, by making the circular windows at the ends of the aisles to turn on pivots, and by admitting air along the outside of the pipes which are employed in cold weather to warm the chapel. If this ventilation were found to be insufficient for the number of scholars, it would be necessary to make dovecot openings in the roof, which would effect the object without interfering with the architecture of the building.

### Citadel.

The citadel occupies an area of about nine acres on the summit of the heights, exposed at all points to the winds. The works are still in progress ; but up to the present time barrack accommodation has been provided for 654 men in four separate sets of casemates, designated as "short casemates," "long casemates," "west-face casemates," "south-lines," most of which are of a very superior and more healthy construction, as compared with casemates of a more ancient date.

The guard-house at the citadel gate is a temporary building of wood, without ventilation, a defect that could very easily be supplied by a shaft from the ceiling, with an inlet for air.

The casemates are of the parabolic form, with an average height of 13 feet, although the summit of the arch is much loftier. They are 18 feet wide, and vary in length from 51 feet to 86 feet ; they have from five to eight windows each at the ends, the loftiest of which is about seven feet high, and a small circular window or opening, high up at each end. There are three fireplaces in each room, which might be remodelled, so as to warm the inflowing air in winter, and rendered available for increasing the ventilation by having a large Arnott's silk-flap valve inserted into the chimney, as high up as possible. The circular windows are intended for ventilation, but are apt to be stopped up by the men. In order to effect their object of keeping the air pure, without drafts, they should be filled with panes of perforated glass.

The following is the barrack accommodation in the casemates :—

| —— | Number of Rooms. | Cubic Feet of Space per Man. | Number of Men in each Room. | Total. |
|---|---|---|---|---|
| Short Casemates | 1 | 574 | 21 | 21 |
| ,, | 1 | 603 | 20 | 20 |
| Long Casemates | 2 | 527 | 34 | 68 |
| ,, | 1 | 563 | 36 | 36 |
| ,, | 1 | 548 | 37 | 37 |
| ,, | 1 | 540 | 22 | 22 |
| ,, | 1 | 516 | 23 | 23 |
| West Face - | 5 | 566 | 32 | 160 |
| ,, | 1 | 585 | 31 | 31 |
| ,, | 1 | 571 | 32 | 32 |
| ,, | 1 | 589 | 31 | 31 |
| ,, | 1 | 573 | 34 | 34 |
| ,, | 3 | 1,993 | 8 | 24 |
| South Lines - | 2 | 460 | 22 | 44 |
| ,, | 2 | 490 | 22 | 44 |
| ,, | 1 | 608 | 27 | 27 |
| Total - - | 25 | — | — | 654 |

These casemates, as will be seen by the cubic space per man, are very little overcrowded.

The average cubic space is so near that which we are required to fix by our instructions, that it might be readily obtained by a little re-arrangement of the beds. The smallest amount is that given by four casemates in the south lines, which have each four or five men too many in them.

We would recommend, therefore, that the space be allotted so as to give as nearly as may be 600 cubic feet per bed. The main sanitary precaution required is to see that the means of ventilation which have been provided in the construction, and the additional means recommended, are properly made use of, as advised above.

Three of the casemates in the west face are appropriated for married soldiers, and are divided into separate rooms by partitions seven feet high, with a passage down the centre, a space to be used in common being left near each fireplace.

The women's wash-house requires a drying stove.

A cook-house, adjacent to the casemates, converted into married quarters, is used occasionally for a wash-house; it also has no drying stove.

The cook-houses have no ovens for baking or roasting meat.

The ablution-rooms require ventilation through the roof, either by means of a dovecot or shafts; the coat pegs are placed over the basins instead of on the back wall; the ablution-rooms are provided with gratings and forms. There are no baths; these should be supplied in the proportion of one bath for every 100 men.

The urinals are not supplied constantly with water.

The latrines have divisions between the seats, but are not furnished with half-doors; they are capable of being flushed, but the water does not stand habitually in them; they should be altered to admit of this being done.

The whole water supply of the Western Heights, as already stated, is derived from a well in the citadel, from which water is pumped up by a steam-engine.

This steam-engine is stated not to be of sufficient power to keep a constant supply, in consequence of the large amount of water wasted by the men.

It is probable that if each ablution-room and privy were furnished with a separate cistern, the waste would not be so great.

There are no cleaning-rooms, bath-rooms, nor shops for pursuing trades; there are no day-rooms, nor covered sheds for drill.

There is no laundry, although it is intended to construct one in connexion with the proposed married quarters. Up to the present time no officers' quarters, nor accommodation for head-quarters of a regiment, have been provided in the citadel.

We have stated generally certain defects appertaining to all the barracks in the citadel, and now subjoin a few remarks on defects existing in individual barracks, and specially connected with their peculiarities of construction.

*The Long Casemates.*—One set of these casemates has large windows at both ends; the other set has windows at one end only, opening into a deep square well, and air flues at the other. There is one fireplace in each. The whole of the long casemates should be provided with perforated glass in the upper windows, and the casemates which have not windows at both ends should only be used for quarters when absolutely necessary.

The ablution-room is very dark; probably a reflector would improve this. There are no baths.

The cook-house is also very dark. It is provided with boilers, but with no means of roasting or baking. It requires a reflector, and a roasting oven.

The urinal is close to the barrack-rooms, and should have a constant supply of water to keep it sweet.

The ash-pit is constructed in the wall of the court, and is covered. It would, however, be very desirable that iron boxes should be substituted, and that when full, they should be removed by the contractor. There is a crane which would be capable of lifting and lowering the boxes into the yard.

*The Short Casemates* are stated to be seldom occupied by troops.

The cook-house has no oven or means of roasting.

The ablution-room is very small, and has no bath.

The privies can be flushed, but are not proper water latrines; that is, the water does not remain in the troughs, as it ought to do, between the times of flushing.

*The South Lines* are not occupied at present. The casemates are good; each contains a room partitioned off for the non-commissioned officer.

There are, however, no means of ventilation; probably the best way of supplying this would be by perforated glass panes in the upper windows, or by circular openings filled with perforated glass close to the top of the arch.

Each room contains two fireplaces. A large Arnott's ventilator, opening as high up as possible into the chimneys, would assist the ventilation, not only in these but in all the other casemates.

The ablution-room is good, but there is no bath.

The cook-house has no oven or means of roasting meat.

The urinals are of slate. They require water to be laid on.

The privies, as in the other lines, are provided with means of flushing, but are not proper water latrines.

As already stated, the citadel casemates are in many respects superior in their structure and accommodation to any others we have hitherto examined, and show a great advance in providing suitably for the health and comfort of the soldier, notwithstanding the difficulties arising from the necessary peculiarities of casemated barracks.

The chief defect at present in the Western Heights barracks, as a whole, appears to be in the water supply. The quantity raised by the engine would appear to be sufficient for every purpose; but it is doubtful whether, considering the amount of waste by the men, it would be enough for water latrines, urinals, and baths. It appears to us to be necessary that improvements in these conveniences should be introduced throughout the barracks, and the question would be,—whether enough of water might not be saved for every purpose out of the present supply? We would advise that steps be taken to ascertain this at once. We have reason to believe that there is enough, if it be properly economized. If there be not, additional engine power would have to be provided.

*We would recommend the following Sanitary Improvements to be carried out at the Casemates:—*

1. Conversion of all privies into water latrines, and introducing divisions of seats and half-doors where it has not been done.
2. Supplying all urinals with water.
3. Substituting for ash-pits, iron carts for collecting and removing all barrack refuse daily.
4. Providing bath-rooms and baths in the proportion of one bath to 100 men.
5. Providing means for baking or roasting meat in every cook-house.
6. Filling up the circular windows at the ends of the casemates with glass as fully perforated as possible; inserting similar perforated glass panes at the top of all the highest windows; remodelling the grates to warm the inflowing air; and introducing an Arnott's large silk valve ventilator into each chimney. Ventilating at the roof all guard-rooms, lavatories, privies, and urinals, which require it.
7. Arranging the accommodation so that each man may have as nearly as may be 600 feet of cubic space to sleep in.
8. Introducing reflectors to throw light into the ablution-room and cook-house of the long casemates.
9. Providing drying stoves for the wash-houses.

Lastly, in carrying out the works, staff and officers' quarters, proper guard-rooms, day-rooms, drill sheds, reading-rooms, and married quarters, for the last of which an excellent site is pointed out, ought to be provided.

*Western Heights Hospital.*

This building stands on the side of the heights facing the sea, and has an appearance from a distance of being a much better hospital than it is in reality. It is divided into two parts, called the *East* and *West* hospitals, the former of which is occupied by sick of the artillery, and the latter by sick of the line.

The building is defective in many important particulars. It is not surrounded by any enclosure, and there is no exercising ground for convalescents, except a piece of road, a thoroughfare, in front of the hospital. In consequence of this want, patients must be always kept in sight of the sentries. A proper enclosure should be made, and ground for exercise provided; but to do this it would be necessary to deviate an existing footpath.

The stairs and passages are of wood; they are low, confined, and narrow.

The wards vary in height from 9 feet 5 inches to 11 feet, which is the highest. They have windows on two adjoining sides, and there is some ventilation by means of auger-holes in the ceiling, communicating with the external air. It is, however, by no means sufficient, and shafts will have to be provided, led up through the ceiling of each ward to the roof of the building.

There are in all 12 wards, six on each side, the accommodation in which, for the east side, is given in the following table, contrasted with what it would be at 1,200 cubic feet per bed :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| Nos. 1 and 2 | 20 | 10 | 10 |
| „ 4 and 5 | 20 | 10 | 10 |
| „ 3 | 6 | 3 | 3 |
| „ 6 | 6 | 2 | 4 |
| Total - - 6 | 52 | 25 | 27 |

This table shows the accommodation on the east side. That on the west side is the same, except that there are two small wards of one bed each.

The total number of beds according to regulation on the two sides would therefore be 106, with an amount of cubic space per bed varying from 466 to 619 feet.

At 1,200 cubic feet per bed, the whole hospital would only accommodate 50 beds, exclusive of the two beds in the small wards.

From deficiency of accommodation, the guard-room has been converted into an itch ward.

There is no authorized accommodation for the sick wives and children of soldiers, but a small ward on the upper floor is at present set apart for them. This want should be supplied.

The staircase and passages are close, and require to be ventilated by a shaft at the top and an inlet for air, or perforated panes of glass in the windows, a stove being provided for warming the air in winter.

There is no lavatory belonging to the hospital, except a back place used for washing linen, where there are metal basins placed on a bench. There is no proper bath-room.

Water is supplied from the citadel works, and also from a rain-water tank. There is a well on the premises, apparently not clean.

Each division of the hospital has a water-closet with one seat, and there is a two-seated privy behind. This latter is drained into a cesspit, and is in a most offensive and noxious condition.

The privies in the yard should be converted into water latrines, the cesspits filled up, and the drainage of the hospital carried into the nearest sewer to discharge into the sea.

The ash-pit is uncovered. An iron barrow, to be emptied daily, should be substituted for it.

The pack-store is in a cellar. It requires additional racks if no better store can be provided.

The bedding and other stores in the basement of the building are described as being all damp and without fireplaces.

The ward windows are stated to be not weather-tight on account of age. The defects are the same in both east and west sides of the building, and require the same remedies.

This hospital might be advantageously extended on a more suitable plan, and with better wards. It is necessary, in fact, that this should be done to afford space for the current sick, as the present wards could only accommodate 50 sick if appropriated according to our instructions; and it is highly probable that as the works are extended the number of men in occupation, and consequently the number of sick, will increase. The situation is a very good one, and wings could easily be thrown out from the present buildings, and better stores could at the same time be provided.

*The following are the Sanitary Improvements immediately required :—*

1. Reduction of numbers of beds, as already mentioned.
2. Ventilation of each ward by a shaft carried up from the ceiling to the roof, with inlets for air near the ceiling properly protected by wire gauze or perforated zinc. Grates to be remodelled to heat the air; also ventilation of the passages and staircase by a shaft and perforated glass panes.
3. Cesspits to be filled up; privies to be converted into water latrines, and to be drained into the sewers.
4. An iron cart to be substituted for the ash-pits.
5. Bath-rooms with baths and hot and cold water, and lavatories adjoining them to be provided.
6. An enclosed exercising ground for convalescents to be provided.
7. Better stores to be provided.
8. Hospital to be extended, and accommodation for the sick of married soldiers' families to be provided.

## 5. DOVER CASTLE BARRACKS.

Dover Castle covers an area of about 70 acres, on a chalk hill, overhanging the sea, and far removed from any source of malaria. It contains three separate sets of barracks; those of Spur Battery, the Keep Yard, and the Cliff Casemates.

*Spur Battery.*

The barrack accommodation in Spur Battery consists of 15 casemates, divided into two stories by a floor, and having windows only at one end, so that there is no thorough ventilation.

The following is the accommodation :—

| Casemates. | Number of Men by present Regulation. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 15 | 245 | 109 | 136 |

It will be seen that there is a very considerable degree of overcrowding in the rooms. Some of them give as little as 240 or 250 cubic feet per man, and the largest cubic space allotted in any of them is no more than 314 cubic feet per man. In their present condition they are dark, wretched, and hardly fit for occupation.

Those on the ground floor are occupied by married soldiers and their families.

Ventilation, so much wanted, could be provided by means of a shaft at the end farthest from the doors

and windows, and by perforated glass panes and an Arnott's ventilator placed in each chimney. These expedients would, however, be at the best unsatisfactory. It would be much better to remove the floor which now divides the casemate into two flats, a measure which would give lofty and improved casemates much more fit for human habitation than the present ones, and the married quarters would have to be removed elsewhere. If this were done the chimneys of the upper flats might be used as ventilating shafts. Remodelled grates for warming the air should also be introduced.

The floors of the lower rooms are of stucco. Proper wooden floors, with ventilation underneath, should be laid.

The privies belonging to these casemates are well constructed; they are flushed every day, and water stands in the trough; between times the water from the ablution-rooms also runs into these privies. The seats require to be divided by partitions, and each compartment should be furnished with a half-door. The urinals have water laid on. There are no baths. The guard-room is gloomy, low, and unventilated.

*We would recommend for these Barracks:—*

1. That the floors dividing the casemates be removed.
2. That the numbers of men in each casemate be reduced, so that every man may have 600 cubic feet of space.
3. That each casemate be ventilated and warmed as described.
4. That the guard-room be ventilated and warmed in a similar manner.
5. That the privies be furnished with divisions and half-doors.
6. That baths be provided. Perhaps the best way of doing this would be to have one bathing establishment for the whole castle, with water laid on, and fixed baths in the proportion of one bath to 100 men.

### Keep Yard Barracks.

These barracks are very defective in structure and in arrangement. They are low-roofed, being mostly from 7 feet 6 inches to 8 feet 10 inches high, irregularly shaped, with the windows at considerable distances from each other, and they are much overcrowded. They are intended to accommodate 246 men, but, as will be presently shown, they have not space for half of this number, even were their structure unexceptionable.

The following table gives the details of the accommodation in the soldiers' rooms:—

| Rooms. | | Present Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|---|
| No. 6 House. | A | 26 | 11 | 15 |
| | B | 26 | 14 | 12 |
| | C | 26 | 11 | 15 |
| | D | 48 | 25 | 23 |
| No. 7 House. | A | 32 | 18 | 14 |
| | B | 32 | 17 | 15 |
| | C | 32 | 25 | 7 |
| No. 10 House. | D | 19 | 8 | 11 |
| Total - 8 | | 241 | 129 | 112 |

It hence follows that were these barrack-rooms every way suitable for troops, nearly one-half of their present occupants would have to be removed out of them to afford adequate cubic space for the remainder.

Besides being overcrowded, the rooms are dark and unventilated, and the roof of the buildings is old and in bad repair.

The rooms in their present state are quite unfit for occupation by troops. It would cost a large sum of money to make them habitable, and even were this done, they would be so imperfect that it would be most desirable, instead of introducing imperfect improvements, that the whole should be remodelled on better and more healthy principles, a step which would have the great advantage of providing some, at all events, of the additional accommodation so much required in this garrison.

The ablution-room belonging to these barracks is small and dark; it requires ventilation and pegs for the men to hang their coats on. There are no baths.

The officers' quarters and serjeant's mess are about to be removed from their present site, so that it is unnecessary to recommend anything in regard to them.

Two of the privies of the officers' quarters drain into a cesspit, which should be abolished, and the privies converted into water-closets, and properly drained.

The quartermasters' store is too small.

The privies are flushed every day and water stands in them; the urinals are also supplied with water.

There is an open ash-pit, which should be removed, and an iron cart substituted for collecting and removing daily all the barrack refuse.

The school-room and library are dark and unventilated; they require to be reconstructed.

The cook-houses have no means of roasting or baking meat, but in the *enciente* of the castle, in the engineers' stores, there is an old oven which might be made available for baking for a sum of 32*l.* The distance, however, is perhaps too great from most of the barracks, and it would be better to provide every cook-house with a roasting oven.

The women's wash-house is unprovided with a drying stove.

It is intended to build some quarters for married men in the castle *enciente* on the site of the present cook-house and women's wash-house. When this improvement is carried out, it would be very advisable to provide a laundry with the recent improvements.

The water supply is derived from a deep well in the chalk, from which an eight-horse power engine pumps up the water; but there is no water tank, and any accident to the engine or pumps would deprive the garrison of water.

Nothing short of reconstruction will make the Keep Yard barracks suitable for habitation. Until that is done, and if they must be occupied, *we would recommend in the meantime:—*

1. Reduction of numbers of men in each room to the extent laid down above.
2. Ventilation of every barrack-room, school-room, and library, by shafts carried through the ceiling and roof, and by inlets for air. Additional windows to be opened if possible. Fire-grates to be remodelled.
3. Roasting oven to be provided for the cook-house.
4. Ablution-room to be improved, pegs to be provided for hanging coats on.
5. A bath for every 100 men to be provided in the manner recommended above.
6. An iron cart to be provided for removing barrack refuse, instead of the ash-pit.
7. Laundry and drying stove for women's wash-house.
8. Cesspits to be abolished, and drains substituted at the officers' quarters. Latrines require additional ventilation.

### Cliff Casemates.

The Cliff casemates are part of the fortifications, and are specially intended for protection during siege.

They are situated at a great depth underground, in the body of the chalk cliff on which Dover Castle stands. They are reached by descending a well staircase, leading to arched passages, the only means of light and ventilation for which is by vertical shafts cut out of the rock, and the casemates open out of

these dark underground passages. Patent reflectors have been hung at different points, to throw some of the descending light into the passages and casemates, but altogether these rooms, with their swarming inmates, afford a very striking and by no means pleasing contrast, to the splendid new officers' quarters erected in the open air some 150 feet above them.

There are nine casemates in all. Six are short, and three are long. The latter, when entered from the passages, resemble railway tunnels, in which everything is invisible except the light entering at the farther end. These three casemates are 199 feet, 225 feet, and 227 feet long, and they have no direct light, except what proceeds from the openings in the cliff overhanging the sea at the farther end. They are only 16 feet wide, and as there are beds on opposite sides, the distance from foot to foot of the beds, across the casemates, is only 2½ feet. The other six casemates vary from 100 to 104 feet in length, and are lighted in a similar manner.

The two longest casemates have three fireplaces in each, and all the others have two fireplaces. The short casemates are only 10½ feet wide, and hold one row of beds. They are divided into two stories. The whole of them, as already stated, are lighted only at one end by a glazed front facing the sea, the other end abutting upon almost dark galleries and shafts cut in the chalk. The windows in all the casemates facing the sea can be opened, and there are ventilating openings, besides the doors at the other end, so that the shafts, to some extent, act as a means of ventilation. They are places which may be conveniently used for temporary occcupation in a siege, but which are most unfit for permanent residence. For above half their length, the long casemates are so dark that the men can hardly be distinguished on first entering from the light.

The following is the accommodation as compared with what it would be at 600 cubic feet per man :—

| —— | Total Inmates by present Regulation. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 6 Short Casemates. | 120 | 87 | 33 |
| 3 Long Casemates. | 294 | 200 | 94 |
| Total - - | 414 | 287 | 127 |

There are urinals and privies also cut out of the rock. They are supplied with water, and the privies are flushed by means of an apparatus worked by a screw, which, from its slowness of operation, prevents the flushing being done with sufficient rapidity. The seats are separated by means of slate partitions. These privies would be greatly improved by a ventilating shaft from the roof, and by louvred windows.

The ablution-rooms are good, but unprovided with baths.

The cook-house has no means of roasting or baking; the only ventilation is by means of louvred windows in front, which is not sufficient. A store is placed at the back in the inner part of the casemate, to which access is obtained from behind.

All these offices are reached by traversing dark gusty passages hewn out of the rock.

The refuse is collected in an ash-pit, which is quite unsuited to such a locality. The ash-pit should be done away with, and an iron barrow substituted, to ensure daily collection and removal of refuse.

The medical officer in charge of the 18th Bedfordshire light infantry states that he has no doubt that these casemated barracks are prejudicial to the health of the men, especially those in the spur. He states that he had more admissions from fever from the casemates in June and July 1858, than in all the previous months of the year in other quarters. That the cases came almost entirely from the spur casemates, and that the cases fell off when the men were removed from them. That all the casemates are damp, more or less, and that rheumatism is prevalent from this circumstance.

Presuming that the intention of these casemates is to afford protection to the men in time of siege, it would be unjust not to state that much attention has been paid to the arrangements necessary for the health and convenience of the inmates. It is no easy matter to combine the requirements for health, with those for defence and protection, in such works ; and in the present case it is most evident that the intention of such a combination has been clearly kept in view. It by no means follows, however, that casemates such as these are suitable for permanent occupation as barracks. We are of opinion that they are not, and that barrack accommodation for the requisite number of men in ordinary occupation should be provided quite independently of these casemates.

Considering them solely with reference to their defensive purposes, *we would recommend the following improvements to be carried out:—*

1. That the long casemates be ventilated by inserting perforated glass panes into the upper portion of all the windows at each end ; by placing a large Arnott's silk flap ventilator in each chimney, and by supplying fresh air from the cliff end by means of a hollow beam, with perforated zinc sides carried along the ceiling.

2. That the kitchen be further ventilated, and a roasting oven be supplied.

3. That means be provided for the daily removal of the refuse, and the ash-pit abolished.

4. That the privy be ventilated, and the means of flushing improved.

Lastly. That until suitable barracks be provided for the men, and all the men removed out of the casemates, the numbers be reduced to the extent specified above.

*The Provost Cells,* eight in number, are placed in a caponière in the ditch of the castle. They are ventilated and heated by air flues from a stove. They are unsuitable for their purpose, and it would be most desirable that good new cells should be built.

*The Guard Room* at the gate of the castle is too small for 15 men who occupy it. It requires ventilation by means of shafts and inlets for air.

A detached picket-house, which is not at present used, is unprovided with either privy or ash-pit.

We would state, in conclusion, that the barrack accommodation of Dover Castle is in a most defective condition, and the whole subject requires to be considered, with the view to its reconstruction and extension. The recommendations we have made in regard to it are, at the best, merely palliative.

It is necessary that they should be carried out in the meantime, but even if they were carried out, we should consider the subject as no less requiring the serious attention of Her Majesty's Government. The present miserable state of all the barracks stands out in marked contrast with the comfort, convenience, and elegance of the officers' new quarters, and what has been done for the officers, who certainly required new quarters as much as the men, should be done in its proper degree for the soldiers also.

### *Dover Castle Hospital.*

The hospital for the garrison sick is an old brick building, situated in front of and below the new officers' quarters. The position is an airy and healthy one, but the building itself is deficient in some important requirements. It is two stories high, and has four large wards, with small wards at the ends, the only entrance to which is through the large wards. All the wards are too low for efficient natural ventilation, although the large wards have windows on both sides. It would be desirable in this case to provide ventilating shafts rising from the ceilings of the wards through the roof, for giving exit to the foul air ; and also inlets for air near the ceilings, and under control of the medical officer, who would

regulate the ventilation according to the state of the weather and force of the wind.

The following, according to the dimensions returned to us, is the present accommodation of this hospital, as contrasted with what it would be if 1,200 cubic feet were allotted to each patient :—

| Wards. | Total Regulation Number of Beds. | Total Number at 1,200 Cubic Feet per Bed. | Total Deficiency in Bed Spaces. |
|---|---|---|---|
| 1, 2, 3, 4 | 72 | 28 | 44 |
| 5 | 2 | 2 | — |
| 6 | 3 | 2 | 1 |
| 7 | 1 | 1 | — |
| Total 7 | 78 | 33 | 45 |

The hospital contains accommodation in these seven wards for no more than 33 beds, at rather less than 1,200 cubic feet per bed. The building requires to be extended to accommodate the present sick, and were the garrison increased in numbers, a corresponding additional increase of the hospital accommodation would be necessary.

There is a water-closet on each floor, constructed within the building, but these water-closets are unventilated, and have no windows to the outer air. They are only lighted and ventilated into the passage by a window opening into the passage. These closets drain into a cesspit immediately behind the hospital, an arrangement which ought to be altered as soon as possible.

Shafts and inlets for air should be at once provided for the present closets, but it would be much better to erect suitable water-closets, bath-rooms, and lavatories outside the hospital buildings, with separate light and ventilation, to fill up the existing cesspool, and to drain the whole buildings to the sea.

The kitchen and scullery are situated at the end of one of the lower wards, and it appears to be the custom to carry all the hospital diets through that ward, as being more convenient than carrying them through the open air outside. It is supposed to be contrary to rule to do so, but no rule will prevent such a thing being done where the convenience is so much greater than carrying the diets outside in all states of the weather.

The kitchen is in fact situated where the lavatories, baths, and water-closets of the ward ought to be. Its cooking arrangements are tolerably good ; it has an oven and an open fireplace, and is considered sufficient.

There is a detached privy behind the hospital, which has a receptacle for water, and is flushed daily. There is a good arrangement at the back, to cause water to flow down constantly by means of a pipe similar to those which supply water to urinals, by which the back is kept clean.

The ash-pit is uncovered ; it should be done away with, and the refuse removed by an iron barrow or cart.

There is no ablution-room, and no bath-room. One ward is used as a bedding store.

The pack store is used also as a provision store, which is objectionable.

We would recommend that this hospital be extended on a plan to include every improvement.

*The following Requirements are necessary for the present Building :—*

1. Reduction of number of beds, as pointed out.
2. Ventilation and warming of wards by shafts and inlets for air, and by remodelled grates.
3. Abolishing the cesspool, and draining the hospital buildings to the sea.
4. Ventilating the present water-closets by shafts and inlets for air, and by a window, until better closets are constructed outside the building.
5. Abolition of ash-pit and daily removal of refuse.
6. Ablution and bath room to be provided.

Proper pack, provision, and other stores, also a room for orderlies, are very much required.

## 6. WALMER BARRACKS.

There are three barracks at Walmer—the South barrack, the Cavalry barrack, and the North barrack. The Royal Naval hospital at Deal, which has been lent for the purpose by the naval authorities, is also at present used as a barrack for infantry.

The whole of these establishments are situated at from 150 to 300 yards from the sea. The military barracks are in open situations, although contiguous to dwelling houses. The Royal Naval hospital, being close to Deal, is nearer the civil population. The whole subsoil of the neighbourhood consists of sand or sandy loam ; porous, and admitting of drainage.

The barracks derive their water supply from the Deal Waterworks Company, by contract, and from rain-water tanks. But the Royal Naval hospital is supplied by pumps.

All the barracks are surface-drained more or less efficiently, but none of them are sewered, although plans and estimates for the work have been already prepared by the Royal Engineers. It is true that the ground is not much elevated above the sea, but the fall to low water, where the sewage could be most conveniently discharged, is quite sufficient.

The absolute want of sewerage and the use of cesspools are sanitary evils common to all these barracks, and nothing effectual can be done in removing the cesspools until proper sewerage works are carried out.

### The South Barracks.

These barracks are constructed of brick, and were built in 1795. The ground within the boundary walls is 10A. 1R. 3P. in area.

They are built in blocks, and there are 23 barrack-rooms, besides attics. Each of the barrack-rooms has four windows, two at each end.

The staircases and landings are of wood, and there is a small room for a non-commissioned officer at the end of each landing, which interferes with the light and ventilation of the staircase.

The barrack-rooms are all occupied beyond the regulation number of men, as will be seen by the following table, which also shows the number which could be accommodated at 600 cubic feet per man :—

| Rooms. | Total Regulation Number of Men. | Total Actual Number. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Regulation Accommodation. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|---|
| 7 | 133 | 147 | 105 | 28 | 19 | 15 |
| 8 | 136 | 160 | 104 | 32 | 17 | 13 |
| 8 | 128 | 136 | 96 | 32 | 16 | 12 |
| Total 23 | 397 | 443 | 305 | 92 | — | — |

The regulation accommodation exceeds the available accommodation at 600 cubic feet per man by 92 men ; but the number actually in the barrack-rooms when the return was sent us exceeded the regulation number by 46, and it exceeded the accommodation at 600 cubic feet per man by 138 men. This latter number shows the extent of overcrowding at the time the return was made.

The rooms are light, but not very lofty. The ceilings are covered with perforated zinc. The floors of some of the rooms are not in good condition. There are no means of ventilation in the rooms, except doors, windws, and fireplaces.

To remove this defect, shafts should be carried up from the ceiling of each room to the roof of the building, and fresh air ought to be admitted into the rooms by means of openings close to the ceilings, or between the zinc lining and the floor above; perforations being made through the zinc to allow the outer air to enter the room.

There is a circular cook-house, provided with boilers and an oven; but the oven is not ventilated and no roasting tins have been provided, so that the oven is of no use.

The ablution-rooms have no ventilation. To remedy this defect shafts should be carried up through the roof and the windows fitted with perforated glass. There are no gratings for the men to stand on, and no baths.

There is an ash-pit for which an iron cart and daily removal of refuse should be substituted.

The urinals and privies are not supplied with water. The seats of the privies are covered with flaps, but there are no divisions, and as all the soil is received into a common cesspit the effluvia are very offensive, and would be more so were it not that a shaft is carried up from each cesspit to a height of from 14 to 18 feet, which diffuses the emanations at a certain elevation above the ground.

There is a wash-house with tubs, but no proper laundry. There is no day-room. The library is too small. There are no covered sheds for drill. The sleeping accommodation for non-commissioned officers is very limited. The serjeants' mess is very small, and has no kitchen. There is no sufficient accommodation for pursuing trades.

The surface drainage of the barrack area runs to the sea through drains, which have a very small fall.

The abolition of cesspits is indispensably necessary to the sanitary improvement of these barracks, and would necessitate an entirely new arrangement for the drainage, which must then, as has been stated, be carried below *low*-water mark, because the shingle moves so considerably between high and low-water mark as to render it impossible to maintain a drain clear which discharges between the two.

In the attics there are quarters for 24 married people. They are not sufficiently ventilated, and there are no suitable divisions between the beds.

The sewerage of these barracks ought to be carried out according to the plan and estimate already made by the Engineering Department with as little delay as possible.

As soon as this is accomplished all the cesspits in the barracks ought to be filled up, and the privies converted into water latrines.

The guard-room and lock-up both require ventilation through the roof. At present they are unventilated.

*We would recommend:—*

1. That the numbers in the barrack-rooms be diminished, so that every man may have 600 cubic feet of space.

2. That every barrack-room be ventilated by a shaft and inlet for air, as recommended; that the guard-room and lock-up be similarly ventilated; and that the married quarters be also ventilated through the roof.

3. That the projected sewerage of the barracks be completed, the whole of the cesspits filled up, and the privies converted into water latrines, with means of flushing, and with divisions of seats and half-doors. That the urinals also be supplied with water.

4. That the kitchen arrangements be completed, so that the ovens may roast meat, and that suitable cooking tins be provided for this purpose.

5. Ablution-rooms to be improved and ventilated as described. Gratings for the men to stand on to be provided. A bath-room and baths in the proportion of one bath to 100 men to be provided.

6. Ash-pits to be abolished, and iron carts, with daily collection and removal of refuse, to be introduced.

7. Laundry to be improved and drying stove provided.

8. Barrack-rooms to be lit with gas, by ventilated burners.

A day-room and drill shed ought also to be constructed.

### Cavalry Barracks.

These barracks are situated close to the South barracks, and were erected in 1794 to accommodate 74 men, but they are almost unoccupied at present. The ground on which they stand is 3A. 1R. 22P. in extent, and is of the same general character as that already described.

They are constructed of brick, on the same principle as the Hounslow and Windsor Cavalry barracks, viz., with the barrack-rooms over the stables, and with the entrance to the barrack-rooms from a dark central passage which runs from one end to the other of the building, having a window at each end. The doors in these rooms open close to the fireplaces.

The rooms have openings for ventilation in the ceilings into the space under the roof; but this arrangement is not sufficient; they require ventilation by means of shafts from the ceiling and separate inlets for air protected by perforated zinc.

The following table shows the accommodation:—

| Rooms. | Regulation Number of Men. | Accommodation at 600 Cubic Feet each. | Deficiency in Accommodation in Men. |
|---|---|---|---|
| 6 | 54 | 42 | 12 |
| 1 | 6 | 5 | 1 |
| 2 | 8 | 6 | 2 |
| 1 | 4 | 3 | 1 |
| 10 | 72 | 56 | 16 |

The present barrack-rooms are therefore set apart by regulation for 16 men more than they can accommodate, at 600 cubic feet per man.

There is a garret above the barrack-rooms which might be adapted for the men removed from the lower rooms if it were properly ventilated and better lighted. The stables also should be ventilated by means of shafts carried up through the roof, and by perforated glass placed in the windows.

The cook-house is in one of the compartments allotted to stables. There is no oven or means of roasting meat.

There is no ablution-room, but one has been authorized; baths are however not included.

The women's wash-house has no drying stove or proper laundry.

The privies drain into cesspits underneath, from which a shaft is constructed to conduct away and diffuse the effluvia into the atmosphere; the seats have flaps, but no divisions or doors. They were very offensive and require reconstruction and conversion into water latrines.

The ash-pit is uncovered; it should be removed and a cart should be substituted.

There is in the enclosure a room used temporarily as an infant school.

The guard-room is not ventilated.

*The chapel school* is a new building which stands on an open piece of ground; it should be enclosed by a proper fence or railing. It appears to be ventilated, but the upper ventilators are small for the cubic contents of the building.

*The following are the Sanitary Improvements we would advise for these Barracks:—*

1. Reducing the regulation number of men as already stated.

2. Ventilation of every barrack-room and also of the guard-room by a shaft from the ceiling, and by inlets for air near the ceiling.

3. Ventilation of the stables by shafts carried from the ceiling to above the roof of the building, with perforated glass windows for admitting air.

4. Drainage of the whole barrack, and the sub-

stitution of a water latrine with divisions and half-doors, in place of the present privy.

5. A roasting oven to be supplied to the cook-house.

6. Suitable ablution and bath room, with one bath to be provided.

7. A drying stove to be placed in the women's wash-house.

### The North Barracks.

These barracks were erected in 1797, and consist of three blocks, connected by a broad arched corridor, which joins them together on the ground floor ; two blocks are used as soldiers' quarters, and the third is the hospital.

The buildings are of brick and stand in an area (including the hospital burial ground) of 9A. 3R. 30P. The ground has the same general characteristics as it has in the other barracks.

The structure of this barrack is very superior, as far as regards health, to almost any other we have seen. The rooms are lofty. They have seven windows in each. They are light and airy, and well adapted for their purpose.

Each block is three stories high, and is traversed by a central passage and staircase, from which access is given on each floor to a room on either side of the landing, occupying the whole length of the building, and having windows both on the side and at the two ends.

At the end of each passage, in the barrack part, is a small room occupied by a non-commissioned officer. One of these rooms has been appropriated to a library. Rooms for the non-commissioned officers have also been partitioned off on the landings.

These rooms require to be ventilated by means of shafts and inlets for air.

The following table shows the amount of accommodation in soldiers' rooms in the two barrack blocks :—

| Rooms. | Total Regulation Number of Men. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 4 | 124 | 92 | 32 | 31 | 23 |
| 4 | 152 | 116 | 36 | 38 | 29 |
| 4 | 132 | 100 | 32 | 33 | 25 |
| 3 | 18 | 18 | — | 6 | 6 |
| 2 | 10 | 8 | 2 | 5 | 4 |
| 17 | 436 | 334 | 102 | — | — |

The barrack-rooms in one block only were occupied when the return was made to us.

It will be seen that the regulation accommodation exceeds the available space at 600 cubic feet per man by 102 men, a number for which additional barrack accommodation will have to be provided.

The cook-houses are situated between the blocks. One cook-house is appropriated to the barracks. They open out of the corridor on the ground floor.

The cook-house appropriated to the barracks is provided with boilers and an oven, but as the oven is not ventilated, it is not adapted for roasting meat.

There are no proper workshops in any of the barracks at Walmer, the rooms which might be appropriated to shops being appropriated for stores, of which the depôt battalions each require one.

The ablution rooms in the North barracks have no gratings for the men to stand on, and there are no baths. These latter should be provided in the proportion of one to every 100 men the barracks can accommodate. The present ablution-room requires ventilation by a shaft from the ceiling, and by perforated panes in the windows.

The privies require reconstruction and conversion into water latrines, but to do this the whole barrack must be sewered, as already mentioned.

The urinals are not supplied with water and are very offensive.

The women's wash-house is in a decayed wooden building ; it has no drying stove, and is only ventilated into a barrack store. The condition of this wooden building renders is questionable how far any improvement in it is possible.

The guard-room is close, and requires ventilation by means of a shaft from the ceiling, and inlets for air.

These barracks are not lighted by means of gas.

*The following are the Sanitary Improvements we would recommend for the North Barracks :—*

1. The sewerage of the entire building to be carried out to low-water mark. The abolition of all cess-pits, and the drainage of all water-closets, privies, sinks, &c., into the sewers.

2. Reconstruction of the privies into water latrines, with divisions and half-doors, and with means of flushing, and reconstruction of urinals with water supply.

3. Ventilating each barrack-room by the largest size Arnott's silk flap ventilator into the chimney, and by a perforated glass pane at the top of each window.

4. Library and non-commissioned officers' rooms to be ventilated.

5. Ablution-room to be improved, and bath-room, with baths in the proportion of one bath for 100 men, to be provided as stated above.

6. Oven in the cook-house to be improved by ventilation, to admit of meat being roasted in it.

7. Wash-house to be repaired, and suitably provided with utensils and a drying-stove, or a new one to be built.

8. Guard-house to be ventilated, as described.

### *Hospital, Walmer.*

The eastern block of the North barracks is used for a hospital, and one room of the centre block is also appropriated as a ward.

There is no separation between the hospital entrance and the rest of the barracks, so that soldiers and convalescents can easily come together. There is a court behind the hospital in which a small garden, or exercising ground, has been laid out for convalescents. The walk of this garden should be paved or asphalted, and covered seats put in for the patients.

The following table shows the ward accommodation in this hospital at present, and what it would be at 1,200 cubic feet per bed :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet per Bed. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| Medical - | 20 | 15 | 5 |
| Venereal - | 20 | 15 | 5 |
| Surgical - | 20 | 12 | 8 |
| Ophthalmic | 20 | 12 | 8 |
| Fever - | 6 | 3 | 3 |
| Infectious | 4 | 2 | 2 |
| Refractory | 3 | 2 | 1 |
| Itch - - | 6 | 3 | 3 |
| | 99 | 64 | 35 |

At 1,200 cubic feet per bed, as near as may be, there is accommodation in this building for 64 beds, and no more.

The wards require remodelled fireplaces on account of the great waste of heat. It would be desirable that, in reconstructing them, a brick chamber separated from the fire should be reserved behind each fireplace, into which air should pass directly from the outside, and be admitted into the room after being warmed. A shaft should be carried up in one corner, from the ceiling through the roof, and a large Arnott's silk flap ventilator should be put into each chimney. Inlets for air near the ceiling should also

be provided, by inserting a perforated glass pane into the top of each window, both shafts and inlets being provided with a means of closing under the control of the medical officer.

On the staircase small wards have been partitioned off from the landings. These should be at once removed. They interfere with the light and ventilation of the stairs and passages. Perforated panes should be placed in the windows, which would then be opened to the staircase.

A shaft, of about 1 foot 6 inches square, should be led up from the ceiling of the staircase through the roof, and a fire-brick stove provided on the ground floor, with a chamber arranged to receive air directly from the outer air, to be warmed before its entrance to the staircase.

The water-closets open immediately out of the wards; they should be provided with double doors, and with perforated panes, and shafts from the ceiling through the roofs for ventilation.

The itch ward is in the yard. It requires ventilation by means of a shaft from the ceiling and inlets for air; a means of closing both under the control of the medical officer being provided.

There is no ward for prisoners, and consequently when a prisoner is sick a sentry mounts guard over him to the disturbance of the other patients.

There are no rooms for the orderlies.

The baths and ablution-rooms are good.

The privies are as good as privies draining into a cesspit can be.

The ashpit should be done away with, and an iron barrow or cart substituted.

The pack store opens into the yard, and appears sufficient.

It would be an improvement to provide a scullery and laundry, both of which are wanting.

*The following are the improvements required for Health in this Hospital:—*

1. Sewerage, as in the other buildings. Abolition of cesspits, and converting privies into water latrines.
2. Reduction of numbers of beds, as recommended.
3. Ventilation of wards by shafts and inlets for air, and improvement in fireplaces, as suggested. Also ventilation of water-closets.
4. Removal of small wards from staircases, and ventilation of staircases as suggested.
5. Abolition of ashpit, and daily removal of refuse.
6. Hospital to be separated from barrack by a suitable enclosure.

## 7. NAVAL HOSPITAL, DEAL.

This building was lent by the Admiralty to the War Department, for the purpose of a barrack, in November 1857. As the building is in temporary occupation, it is only necessary to state generally that it is overcrowded with men, that the wards or rooms are not ventilated, that there is no sewerage, and that it is not supplied with water from the town works, but from a well in the yard, at no great distance from most offensive privies and cesspits. There are good baths in it, which the men are not allowed to use. This restriction should be removed.

The privies alluded to are very objectionable. They empty into a cesspit, and the opening through which the cesspit is cleared is only covered by an ill fitting wooden top.

Additional ventilation, both by a shaft from the cesspit, and by shafts and inlets for air in the privy, would improve them; but to be made satisfactory, the privies require thorough reconstruction, and sewerage works similar to those recommended for the barracks.

The water supply is pumped up by manual labour. It would be very desirable that water should be obtained from the water company which supplies the town, as the cesspools are much too close to the well to be safe.

The guard-room is dark and unventilated.

If this building is to be used for any length of time, it will be necessary to improve the sewerage, to convert the privies into water latrines, to ventilate the rooms by shafts and inlets, as already recommended for the other barracks, to reduce the number of men, so as to give 600 cubic feet per man, and to obtain a proper water supply.

## 8. CANTERBURY BARRACKS.

These barracks occupy an inclosure of nearly 31 acres in area, situated at the outskirts of the town of Canterbury, in an open airy position, with the ground sloping gently towards the river, about 200 yards distant. The subsoil consists of clay, or brick, earth, and gravel. It is not self-draining, and some portions of the surface are soft and wet in wet weather.

There are four barracks within the inclosure, viz.:—

The Cavalry barrack, built in 1795.
The Artillery barrack, built in 1802.
The North Gate barrack, built in 1803.
And the permanent Infantry barrack, built in 1806.

All the buildings are constructed of brick, and adjoin each other.

### The Cavalry Barrack.

This barrack consists of a long range of buildings of the usual construction. The stables are on the basement, and above them are two ranges, back and front, of barrack-rooms, with an intervening gloomy corridor of considerable length, having a window at each end.

The arrangement of barrack-rooms over stables we have objected to in our previous reports, and we shall merely repeat the objection here. In all future barracks it would be very advisable, wherever practicable, to follow the example of the Maidstone cavalry barrack, and place the men and horses under separate roofs, at a distance from each other.

The barrack-rooms are of the usual construction. They contain too many men, and are imperfectly ventilated by apertures in the ceilings, opening into the attics, but without any direct communication with the external air.

The following is the accommodation in the soldiers' rooms:—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation per Man. |
|---|---|---|---|
| 30 | 270 | 240 | 30 |

Each room gives accommodation for nine men, according to the present regulation. By removing one man from each room, 30 men in all, a cubic space of not much less than 600 cubic feet per man will be given.

Above the barrack-rooms are extensive attics, partly used as barrack-master's stores, partly as workshops. These workshops are all defectively ventilated, and are apt to become oppressively hot. This latter defect would be much diminished by improving the ventilation.

Besides diminishing the number of inmates, these barrack-rooms require ventilation by shafts carried up from the ceiling of each room to the roof, and by separate inlets for air, protected by perforated zinc, near the ceiling. During winter, the fresh air admitted might be warmed, by being made to pass through a fire-brick chamber behind, or at the sides of the fireplace, before being admitted into the room. The corridors require lighting and ventilation by large skylights at intervals in the roof, and by plastered shafts, the width of the corridor, rising to them from the ceiling of the corridor.

The stables have zinc ceilings, and four ventilators, one at each corner ; but each stable ought to be ventilated above the roof by a shaft, to carry off the fumes, and by perforated glass in the windows.

As is usual in many cavalry barracks, the yard in rear of the barracks is narrow and confined, and is further contracted by washhouses, kitchens, urinals, and ash-pits. It would be a great advantage to reconstruct these offices at a greater distance from the barracks, by taking a piece of ground from the sick horse field adjoining.

The only places for cleaning are at the bottom of the stairs, leading up to the barrack-rooms. There is one cleaning-room in Canterbury barracks, but it is at present used as a butcher's shop, and proper cleaning sheds are stated to be much wanted.

The privies consist simply of cesspits without drainage, and they are in a very offensive state, although great pains have been taken to improve them, as far as their radically defective structure will admit.

Nothing effectual can be done without a thorough drainage of the whole establishment, and a sufficient water supply.

At present the water is obtained from wells in the barrack yard. The supply is not sufficient for an establishment of such magnitude ; the wells are too close to the privies and cesspits, and other provisions should be made for supplying the whole barracks with water without delay.

The dung-heaps are placed at a sufficient distance from the soldiers' quarters, but the ashpits are too close to the quarters, and should, in fact, be removed altogether, and iron carts substituted, with daily removal of barrack refuse.

The cook-house is supplied with boilers, but has no means of roasting or baking meat.

The lavatory has no gratings for the feet, nor pegs for hanging coats on.

There are no bath-rooms nor baths.

The urinals are in the open air, and uncovered above. They should be roofed over.

The wash-house has no drying-stove.

The guard-room of the Cavalry barracks is small, and requires ventilation by a roof ventilator.

The canteen is a miserable place, and is far too small for so large a number of men.

### Royal Artillery Barracks.

This barrack is situated between the Cavalry and Infantry barracks, and has regulation accommodation for 225 men, exclusive of non-commissioned officers.

The rooms are mostly eight feet high. Some are lighted with one window, others with two, but there are no sufficient means of ventilation.

They are much overcrowded, as may be seen by the following table of accommodation :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 3 | 45 | 21 | 24 | 15 | 7 |
| 8 | 120 | 80 | 40 | 15 | 10 |
| 4 | 60 | 48 | 12 | 15 | 12 |
| 15 | 225 | 149 | 76 | — | — |

The deficiency of accommodation amounts to one-third of the whole.

Two of the upper rooms receive part of their light and air from windows into a staircase, or short corridor, and are unusually close, and often offensive from this error in construction, by which the foul air of other barrack-rooms is admitted into them instead of fresh air.

The ablution house has neither gratings nor pegs, and there is no proper drainage.

Boilers are the only means of cooking provided for the men in this barrack.

The privies are open to the same objection as those in the Cavalry barracks. They require drainage and reconstruction, with an abundant supply of water.

### The North Gate Barracks.

This barrack contains 21 men's rooms, with regulation accommodation for 420 men, exclusive of non-commissioned officers. The rooms vary in height from 8 feet 8 inches to 10 feet 8 inches, and from 16 to 44 feet in length.

The men's rooms have two or three windows each. A berth for a non-commissioned officer is placed in each room, which covers the light of one window.

There are openings for ventilation in the ceilings of the rooms, but they are not sufficient, and each room requires to be separately ventilated by a shaft and inlets for air, in the way already mentioned for the other barracks.

The staff-serjeants' quarters require ventilation by Arnott's silk flap valve.

The wash-house has no drying-stove, and no gratings for the women to stand on. It is not sufficiently ventilated.

The privies are in a very bad state, as well as the urinals, and require reconstruction.

These barracks are overcrowded, as the following table of accommodation shows :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 7 | 140 | 91 | 49 | 20 | 13 |
| 8 | 160 | 120 | 40 | 20 | 15 |
| 6 | 120 | 96 | 24 | 20 | 16 |
| 21 | 420 | 307 | 113 | — | — |

The accommodation is therefore deficient about 25 per cent.

### Permanent Infantry Barracks.

The barrack-rooms in these barracks are in two blocks, two stories high, in each of which there are three sets of rooms. The rooms open out of a passage, and have windows on two sides.

There are hollow beams with openings into them along the ceilings, which afford some ventilation to the rooms. The lower sash of each window opens on pivots, but the upper sash, which is the most important for ventilation, does not open.

There is no accommodation for married soldiers, and hence some of the soldiers' rooms have to be appropriated to them.

The other rooms are overcrowded, and require the numbers of the inmates to be reduced as follows :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 41 | 820 | 533 | 287 | 20 | 13 |

There is hence a deficiency of accommodation of above 30 per cent.

The privies of these barracks, like those of all the

others, are most offensive, and require drainage and reconstruction.

The ash-pit is also in an unwholesome condition, and ought to be altogether removed and an iron cart substituted.

The ablution-rooms are small. There is one behind each block. They have no gratings for the men to stand on. The ablution-table is of slate, but there is no ledge to prevent the water running on the men when washing. There are no baths.

The cook-house has no oven or means of roasting. It requires additional ventilation in the roof and perforated panes in the windows.

The guard-rooms, lock-up rooms, and cells of these barracks are all deficient in ventilation.

It would be a great advantage to have one prison and lock-up for the whole barrack, instead of a number of separate cells in different parts of it.

The barrack-master's stores are also scattered over the barracks, and the department would be improved by having proper stores built in a convenient locality.

An old hospital in the square of the cavalry barrack has been set apart for married quarters. It is a miserable place in its present state, and the whole of the basement is unfit for human habitation.

The privies and ash-pits of this place are in a very bad and unwholesome state.

We are of opinion that the basement rooms should not be occupied ; that the privies should be converted into water latrines ; that the ash-pit should be entirely removed, and that the rooms occupied by families should all be ventilated by an Arnott's silk flap ventilator.

Properly constructed married quarters are much wanted for these barracks.

### *Canterbury Hospital.*

This hospital is situated in an open airy locality, at a convenient distance from the barracks, and without any population near it.

The building consists of a central part, with a corridor running along one side of it, with the wards entering from the corridors, and consequently receiving direct light and air only on one side of the building. There are two slightly projecting wings, the wards of which have windows on two sides.

The hospital is in two divisions, A and B, one for cavalry the other for infantry, and most of its administrative arrangements are in duplicate.

Each division has 76 beds, with upwards of 700 cubic feet of space to each.

The following table exhibits the ward accommodation in one division of the hospital, as contrasted with what it would be at 1,200 cubic feet per bed :—

| Wards. | | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|---|
| Basement | 1 | 8 | 5 | 3 |
| | 2 | 8 | 5 | 3 |
| | 3 | 8 | 5 | 3 |
| 1st Floor | 4 | 8 | 5 | 3 |
| | 5 | 8 | 5 | 3 |
| | 6 | 4 | 2 | 2 |
| | 7 | 8 | 5 | 3 |
| 2nd Floor | 8 | 8 | 5 | 3 |
| | 9 | 8 | 5 | 3 |
| | 10 | 8 | 5 | 3 |
| Total - 10 | | 76 | 47 | 29 |

The other division of the hospital affords the same extent of accommodation. There are thus in all 20 wards and 152 beds in the building.

In order to set aside 1,200 cubic feet per bed, as required by our instructions, it would therefore be necessary to remove 29 beds out of each division, or 58 beds in all, leaving 94 beds as the available accommodation.

Several of the arrangements of this hospital are very defective. There are no water-closets. There is no proper drainage or water supply. The only conveniences for the sick are most offensive privies over cesspits in the back yard, and which can be reached only by walking across a very rough, ill-paved footway exposed to the weather.

At no great distance from the privies is the pump, described as being difficult to work, which supplies the hospital with water.

There is a wash-house with one 34-gallon boiler.

The kitchens, though conveniently situated and connected with the hospital by a roofed passage open at the sides, have imperfect cooking arrangements.

The pack store is in the basement, and is reached by passing through the coal cellar. It is of course damp and dark.

There are no bedding or other stores.

There are no lavatories.

There are no baths.

There is no itch ward, although one is necessary for the numerous recruits sent to these barracks.

There is an ash-pit too close to the hospital.

The whole hospital is lit by candles.

The hospital is not sufficiently cut off by an enclosure from the adjoining ground, a defect which leads to sundry irregularities.

The ventilation of the wards is provided for by swing sashes in the upper part of the windows, and by a perforated beam passing across the ceiling. It is not sufficient, and might be readily improved by ventilating shafts carried up from the ceilings to the roof.

Before proceeding to state the sanitary improvements required for these barracks, it is necessary to express our opinion strongly on the necessity of immediately removing the fundamental defects we have already adverted to in the drainage and water supply.

Within the barrack walls there is a population of some 2,000 men, women, and children, besides horses, without any efficient means for removing the fluid refuse produced by them.

The area has cesspits all over it, with wells dug in the same soil, and also ash-pits in all degrees of offensiveness. The privies are all of them abominable, and require to be entirely reconstructed : and yet not one effectual step can be taken to accomplish these needful improvements until the entire area occupied by the barracks and hospital is properly drained.

It would be perfectly possible to obtain an abundant supply of good water from the hill close to and above the level of the barracks, a step which must accompany the execution of any drainage works. The water might be obtained from a well and pumped up to a tank, from whence it might be easily distributed over the entire barracks and hospital.

The outlet for the barrack drainage is into a stream which passes within a few hundred yards of the boundary. This stream receives the present drainage of the city of Canterbury ; and although the addition of the latrine drainage of the barracks, thrown into it as it would be once a day, might not add materially to the pollution of the stream, we should, nevertheless, think it desirable to have the barrack drainage deodorized, unless it could be applied to the irrigation of neighbouring grass land, as all such drainage ought to be.

We have been informed that plans for the drainage and water supply have been drawn out, and that the total estimated cost is 10,000*l*., of which 3,000*l*. was proposed this year, but struck out of the annual estimate.

Taking it for granted that the proposed works of drainage and water supply ought to be carried out, which they ought to be without delay, otherwise the necessary drainage improvements are impracticable,—

*We would recommend, as applicable to the whole Establishment, Barracks, Married Quarters, and Hospital :—*

1. That the cesspits be all abolished and filled up.
2. That all privies be converted into water latrines, with proper water supply, divisions of seats and half doors, and flushed out once a day.
3. That all urinals be properly constructed and supplied with water.
4. That all ash-pits throughout the establishment be abolished, and a service organized by which the whole barrack refuse may be collected in iron carts and removed daily.
5. That every cook-house in the barracks be supplied with means of roasting or baking meat.
6. That bath-rooms and baths, in the proportion of one bath for every 100 men, be provided in some convenient locality ; that a sufficiency of foot-pans for cleanliness be also provided and supplied with water; and that gratings and pegs be provided in the ablution-houses.
7. That all the wash-houses be supplied with drying-stoves, places for ironing linen, and gratings to stand on.
8. That cleaning-rooms, day-rooms, and drill sheds be provided.
9. That the guard-rooms be ventilated by shafts and inlets for air.

Lastly, it would be very advisable to light the whole barrack and hospital with gas.

These requirements are applicable throughout the establishment, and ought all to be carried out. There are others besides which refer more especially to individual barracks, and these are as follow :—

*Cavalry Barracks.*

1. To remove one man from each barrack-room, and provide other accommodation for the 30 men so removed.
2. To ventilate every barrack-room by a shaft carried up from the ceiling to above the roof of the barrack, and to provide inlets for fresh air, through a perforated zinc cornice, for each room near the ceiling.
3. To light and ventilate the corridor by opening large ventilating skylights in the roof of the building, and carrying up a plastered shaft the width of the corridor from its ceiling to the skylight above.
4. To ventilate, by louvred turrets, all the workshops in the attics, and to increase their light.
5. To put a roof over the urinals, and to supply them with water.
6. To ventilate the non-commissioned officers' rooms and the married quarters by an Arnott's silk flap valve into each chimney. All window sashes to be made to open at top, and a perforated glass pane to be introduced into each window.
7. Stables to be ventilated by a shaft carried from the ceiling to above the roof of the building, and by perforated glass in the windows.

*Royal Artillery Barracks.*

The improvements required specially for this barrack, besides those already enumerated, are :—

1. Providing additional accommodation for 76 men to be removed from the rooms, and allotting 600 cubic feet for the remainder, as near as may be.
2. To ventilate all the rooms by shafts carried up from the ceilings to above the roof, and by inlets for air, through perforated zinc, near the ceilings. To provide additional light in the darker rooms.

*North Gate Barracks.*

1. To remove 113 men from these barracks, and to allot, as near as may be, 600 cubic feet per man for the remainder.
2. To ventilate each room by a shaft and by inlets for air in the manner already mentioned, and to provide additional light where necessary.

*Permanent Infantry Barracks.*

The following are the additional sanitary improvements required for these barracks :—

1. Accommodation to be provided for 287 soldiers, the present excess of occupants of the rooms, and 600 cubic feet per man to be allotted, as near as may be, to the remainder.
2. Ventilation of each room by a shaft from the ceiling.

*Hospital.*

1. Water-closets, lavatories, and bath-rooms to be provided for each flat.
2. Existing privies to be converted into water latrines and drained.
3. Each ward to be ventilated by a shaft from the ceiling, and the air to be warmed by remodelling the grates.
4. A cubic space of 1,200 cubic feet, as near as may be, to be set apart for each patient, and 58 beds to be removed from the wards.
5. Suitable means of washing the hospital linen to be provided instead of the present wash-houses, which might be conveniently added to the kitchen.
6. Proper kitchen ranges and boilers for cooking diets to be provided.
7. Pack store, bedding store, and provision store to be provided.
8. An itch ward to be provided.

We have the honour to be, &c.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission, Oct. 15, 1858.*

---

## PORTSMOUTH DISTRICT.

SIR,

IN compliance with our instructions, we have inspected and made inquiry into the state of the barracks in the Portsmouth district, with special reference to the points on which we were required to report, and we have now the honour to do so as follows.

We have inspected the following barracks and hospitals in this district :—

1. Anglesey barracks, Portsea.
2. Royal Engineer barrack, Portsea.
3. Colewort barracks.
4. Cambridge barracks.
5. Clarence barrack.
6. Fort Cumberland.
7. Point battery.
8. Blockhouse fort, Gosport.
9. Fort Monckton, Gosport.
10. Haslar barrack and hospital, Gosport.
11. Garrison hospital, Portsea.
12. Winchester barrack and hospital.

And we proceed to give the details in regard to each separately.

### 1. ANGLESEY BARRACKS, PORTSEA.

This barrack is of recent erection, and stands upon 5A. 2R. 12P. of ground. Being built within the lines, it is situated on low ground, and in the immediate

vicinity of the dwellings of the civil population. The building contains 53 barrack-rooms, all of which, at the time of our inspection, were fully occupied up to the regulation number of 18 men per room.

The whole barrack has regulation accommodation for 954 men. The rooms are nearly of a size, and give an average space of about 489 cubic feet per man.

The following is the present accommodation as compared with what it would be at 600 cubic feet per man :—

| Number of Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 53 | 954 | 794 | 160 | 18 | 15 |

From the dimensions of the rooms it is impossible to apportion the cubic space exactly at 600 cubic feet per man, without leaving a considerable balance ; but the number 160 represents nearly the excess of present inmates over the accommodation at 600 cubic feet per man.

The barrack-rooms are built back to back, with windows only on one side.

The rooms are tolerably well lighted, with the exception of those at the back on the ground-floor, which are rather dark, on account of the interception of light by the corridor.

These rooms have no sufficient means of renewing the air for so large a number of men. There is only an opening for ventilation into each chimney, 9 inches long by 3 inches broad, protected by a valve. The current of air passing into this opening is variable, and smoke sometimes issues from the opening into the room ; but even if the plan acted fully, the aperture would not by any means afford sufficient egress for the foul air of the room. The guard-room is not sufficiently ventilated.

There is no day-room, and there are no baths belonging to the barrack.

The privies, both in the barracks and officers' quarters, are without water for flushing, and are drained into cess-pits, which are periodically emptied by contract. The urinals are in the same yard with the privies, and have no water for cleansing.

The kitchens are supplied with boilers, but have no means of roasting or baking meat.

The ablution-rooms are good, but there are no wooden gratings for the men to stand on. The floors being asphalted are usually damp and wet.

The lower rooms of the barracks have likewise floors of asphalt, which is an objectionable material for such a purpose.

At about 40 yards' distance from the barracks are special quarters for 60 married soldiers. They consist of 60 rooms in five blocks of rooms of three floors ; each room is intended to accommodate a family, and has a capacity of 1,680 cubic feet.

Attached to this building is a very complete laundry, with other conveniences.

The ventilation of the rooms being dependent entirely on the opening of the doors and windows, cannot be considered sufficient for the limited cubic space for the members of a family, and should be improved by introducing air-bricks.

*The following are the Sanitary Improvements required for Anglesey Barracks:—*

1. Reduction of the number of men in every barrack-room by giving 600 cubic feet per man. To do this it will be necessary to remove somewhere about three men out of each of the rooms.

2. Ventilating every barrack-room by a shaft carried from the ceiling of the room through the roof, and protecting the upper end of the shaft by louvres. At the same time fresh air to be admitted by openings near the ceiling, and diffused through wire gauze or perforated zinc, as recommended for the London barracks.

3. Ventilation of gas burners by a tube into the chimney.

4. Cess-pools to be entirely abolished. The privies to be converted into water latrines, with flushing arrangements, and drained direct into the sewers. Divisions between the seats, and half-doors to be provided. Privies in officers' quarters to be converted into water-closets.

5. Urinals to be improved and supplied with water for cleansing.

6. A cooking stove, with means for roasting and baking meat, to be provided for the kitchen.

7. Ablution-rooms to be provided with wooden gratings for the men to stand on.

8. Baths to be provided in the proportion of one to 100 men.

9. Guard-room to be ventilated.

10. Ash-pit to be reduced in size to contain one day's ashes only, and to be covered ; but it would be better to collect and remove the ashes daily in an iron cart.

11. School-rooms and library to be ventilated.

Besides these requirements for health, it would be very desirable to provide a day-room for the men.

## 2. ROYAL ENGINEER BARRACK.

This is a small barrack, not far from the preceding, standing on 3R. 33P. of ground, with regulation space for 99 men.

It has three barrack-rooms, the accommodation in which is as follows :—

| Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation. |
|---|---|---|---|
| 1 | 33 | 24 | 9 |
| 2 | 33 | 33 | — |
| 3 | 33 | 33 | — |
| 3 | 99 | 90 | 9 |

There is no misappropriation of rooms. There are no special means of ventilation for any of the rooms. There is no day-room, school-room, library, baths, nor laundry.

The kitchen is supplied with baking oven and four boilers.

There is no cleaning-room.

The rooms are lighted with candles.

Water is obtained from the water company.

There is no special sleeping accommodation or mess for non-commissioned officers.

Gratings are required in the lavatory for the men to stand on while washing.

There is a latrine with a cesspit attached, which is emptied by contract.

The hospital of this barrack has the means of thorough lighting and ventilation. The space up to the rafters is taken into the wards, which have, moreover, windows on both sides. The upper sashes of windows are on pivots, and can be opened as much as may be required.

This barrack is small, isolated from other buildings, and contains very few men, which circumstances ought to be taken into account in improving it.

*The following we consider the necessary Requirements for Health :—*

1. Removing nine men from No. 1 room, and ventilating each room with upcast shafts and apertures for admitting fresh air.

2. Abolishing the cesspit, and providing a proper water latrine with drainage and flushing arrangements.
3. Gratings for men to stand on while washing.
4. A bath to be provided. It would be advantageous to light the rooms with gas.

## 3. COLEWORT BARRACKS.

There are in this case two barracks within the same enclosure, one for artillery and the other for infantry. The whole establishment stands on 3A. 0R. 37P. of ground.

### Royal Artillery.

This barrack occupies one side of the same square in which Colewort infantry barracks are situated. It is an old building, with some of the rooms low in the ceiling, in proportion to their length and breadth, and the structure generally is not well adapted for thorough ventilation.

The barrack is scheduled to accommodate 185 men.

The following are the details of the accommodation :—

| Rooms. | Regulation Number of Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation. |
|---|---|---|---|
| No. | | | |
| 1 | 24 | 20 | 4 |
| 2 | 28 | 26 | 2 |
| 3 | 28 | 22 | 6 |
| 4 | 24 | 14 | 10 |
| 5 | 30 | 26 | 4 |
| 6 | 30 | 22 | 8 |
| 7 | 21 | 14 | 7 |
| 7 | 185 | 144 | 41 |

This barrack, therefore, contains 41 men more than the accommodation would admit of, at a little more than 600 cubic feet per man. The number 144 represents approximately the number of men the building might safely hold.

There is no misappropriation of rooms, for all are occupied by men.

The ventilation generally is very imperfect throughout the building.

There are no day-rooms, baths, drying stove, cleaning room, or covered shed for drill.

The water supply is obtained from pumps and rain-water tanks.

The privies are of the ordinary construction, and without water for flushing ; they are emptied by night carts.

There is no mess accommodation for non-commissioned officers.

The kitchen is provided with iron boilers, but has no other means of cooking meat.

*The following are the Requirements for Health in this Barrack :—*

1. Reduction of numbers in the proportions per room given above, and allotting 600 cubic feet per man.
2. Ventilation of every room by a sufficient number of upcast shafts from each room, and providing the means of admitting a sufficiency of fresh air near the ceiling of each room.
3. Cesspools to be abolished and proper water latrines with drainage and flushing apparatus to be introduced.
4. Baths to be provided.
5. Drying stove for the laundry to be provided.
6. Kitchen to be provided with means of roasting and baking meat.

### Infantry Barracks.

This is a very old barrack, surrounded by houses of the civil population.

It contains 14 barrack-rooms, 8 of which are 9 feet high, and 6 are only 8 feet high. Each room is intended to accommodate 17 men, and the following are the details :—

| Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 1, 2, 5, 6, 11, 12 | 102 | 48 | 54 | 17 | 8 |
| 4, 7, 8, 9, 13, 14, 15, 16 | 136 | 72 | 64 | 17 | 9 |
| Total - | 238 | 120 | 118 | — | — |

The inmates of the 9-feet rooms have 338 cubic feet per man, while those in the 8-feet rooms have only 300 cubic feet per man. The regulation accommodation is for 238 men.

Each room has four small windows, some of which are 6 feet high, some 4 feet 9 inches high, and in six rooms the windows are only 3 feet high.

There are no means of ventilation for these rooms, except by small openings above the fire-place, and by the windows and doors.

The rooms were close and offensive at the time we inspected them.

They are lit with candles.

There is no day-room.

The library for the troops in Portsmouth is situated in Colewort barracks.

The school-room is low-roofed, without ventilation, and noisy from being under the barrack-rooms.

There is no shed for drill.

The laundry is provided with two coppers and a bench. Water is not laid on, and there is no drying stove.

The kitchen is provided with boilers, but has no provision for roasting or baking meat.

Water is obtained from the Farlington Water Company, and from a pump. Rain-water is also collected for use.

The privies are dark and noisome, and not drained nor supplied with water. They are emptied by night carts.

There is no grating for the men's feet in the ablution-room.

There is a small bath-room partitioned off from the lavatory, but it contains only one slipper bath. There are four foot baths in the lavatory itself.

Colewort barrack is old and very defective in many respects. It is, as a whole, a very unsuitable building for its purpose. But it has one good point in its structure, that of dividing the range of buildings into separate blocks, which admits a freer external circulation of air. We should not advise much money to be spent on it, but so long as the building is occupied, there are certain conditions necessary for ensuring the health of the men, which ought to be secured as far as possible.

*The following are the Requirements for Health :—*

1. One-half of the men ought to be removed out of the barrack, and 600 cubic feet per man allotted in each room.
2. The barrack-rooms and school-rooms should be ventilated by air-shafts and apertures for admitting air near the ceiling. Guard-room also to be ventilated.
3. Barrack to be drained, and the privies to be connected with the drains, supplied with water, and converted into water latrines.
4. Kitchen to be provided with roasting oven.
5. Proper bath accommodation to be provided.
6. The ash-pit ought to be covered, or, still better, removed altogether, and iron carts used for removing daily the whole barrack refuse.

7. Laundry to be improved, and a drying stove provided.

We have made these recommendations in order to make the building somewhat better adapted for barrack purposes; but if sufficient accommodation can be found elsewhere for the men it contains, the best thing to do with the present barrack would be to convert it into married quarters, for which it would be much more suitable than it is for its present purpose.

It would be desirable, were it practicable, to prevent the public having access to the yard attached to these barracks. There is unfortunately a right of way across the yard, which opens a door for irregularities of various kinds.

## 4. CAMBRIDGE BARRACKS.

These barracks are situated in the centre of the town, and part of them has been recently rebuilt upon a better plan and scale than the older barracks. They stand on 3A. 0R. 7P. of ground.

### *New Barrack.*

The rooms of this new part are spacious and light; they are 11 feet 9 inches high, and have each three windows 6 feet 9 inches in height by 3 feet 6 inches in width. The chief structural defect of these rooms is that they are built back to back, with windows only on one side, so that there is no cross ventilation. Each pair of back to back rooms communicates by air bricks through the party wall close to the ceiling, but these openings are of no use in ventilating the rooms, on account of the distance between the opposite windows, which is about 44 feet.

There are 26 barrack-rooms in the new building, and each room, with two exceptions, accommodates 18 men by regulation. In the other two rooms there are 17 men in each. The total accommodation in the new building is, therefore, set apart by regulation for 466 men, with a space per man of from 500 to 542 cubic feet.

The following table gives the details :—

| Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 1, 2, 4, 15, 16, 17, 18 | 125 | 112 | 13 |
| 5, 9 | 36 | 30 | 6 |
| 3, 13, 14 | 53 | 45 | 8 |
| 6, 7, 8, 10, 11, 12, 19 to 26 | 252 | 224 | 28 |
| Total 26 | 466 | 411 | 55 |

The space allotted in this new barrack is a great advance on the existing regulation in many other barracks, but it is not enough. In order to comply with the requirements in our instructions, it will be necessary to remove 55 men to other quarters, to give the required space of 600 cubic feet per man.

### *Old Barracks.*

The old part of Cambridge barracks is much behind the newer portion in arrangements. There are in it 26 barrack-rooms, containing from 17 to 26 men in each, with a cubic space per man varying from 372 to upwards of 550 cubic feet.

The following is the accommodation by regulation in each room, with the deficiency of accommodation at 600 cubic feet per man :—

| Rooms. | Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation. |
|---|---|---|---|
| No. | | | |
| 2 | 20 | 12 | 8 |
| 3 | 20 | 13 | 7 |
| 4 | 20 | 13 | 7 |
| 5 | 20 | 15 | 5 |
| 6 | 20 | 15 | 5 |
| 7 | 20 | 12 | 8 |
| 8 | 20 | 14 | 6 |
| 9 | 20 | 14 | 6 |
| 10 | 17 | 13 | 4 |
| 11 | 21 | 12 | 9 |
| 12 | 21 | 15 | 6 |
| 13 | 20 | 12 | 8 |
| 14 | 20 | 13 | 7 |
| 15 | 26 | 16 | 10 |
| 16 | 23 | 16 | 7 |
| 17 | 20 | 14 | 6 |
| 18 | 19 | 12 | 7 |
| 19 | 23 | 20 | 3 |
| 20 | 20 | 17 | 3 |
| 21 | 19 | 12 | 7 |
| 22 | 22 | 16 | 6 |
| 23 | 24 | 16 | 8 |
| 24 | 24 | 17 | 7 |
| 25 | 22 | 17 | 5 |
| 26 | 23 | 20 | 3 |
| 27 | 22 | 20 | 2 |
| Totals 26 | 546 | 386 | 160 |

We have divided the cubic space as nearly as may be into portions of 600 cubic feet per man, and it appears that by existing regulations there are 546 men in the space sufficient for 386, and consequently 160 men ought to be removed out of these old barrack-rooms.

The rooms are, moreover, not well adapted for their purpose; they are low ceiled in proportion to their area. Many of them are rather gloomy although they have windows on opposite sides, and they have no proper means of ventilation.

Cambridge barracks are partly lit with gas, partly with candles.

They are supplied with water partly by the water company, partly from rain water.

The privies require to be converted into water latrines, with the means of flushing into the drains.

The slate tables of the lavatory require a raised edge, to prevent the water running off and wetting the men.

There are no gratings for the men to stand on, nor pegs for hanging coats, &c.

There is no bathing accommodation. (We are informed that, since our inspection, baths have been authorized, and that gratings and pegs have been placed in the lavatory.)

The ashpit is large and open. It should either be contracted and covered, or the whole dust and refuse be deposited in an iron cart, and removed once a day, which would be preferable.

The kitchen has no means of cooking, except boilers.

These barracks have no day-room, school-room (the room now used is a barrack-room), no library, cleaning-room, drill shed, or married people's quarters.

*We would recommend the following Improvements to be carried out in Cambridge Barracks:—*

1. Removal of two men out of each room in the new building.

2. Reduction of numbers in the old building to the extent pointed out.

3. Ventilation of every room in both buildings, and also of the guard-room, by air shafts and inlets. Ventilation of gas burners into the chimney.

4. Converting privies into water latrines, with means of flushing.

5. Improvement of ashpit, or if possible, daily removal of refuse in the way pointed out.

6. Roasting and baking apparatus to be provided for kitchen.

The other deficiences ought also to be supplied, but those indicated above appear to us to be the most immediately necessary for health.

## 5. CLARENCE BARRACK.

This is an old badly constructed barrack, situated in a filthy, close, and ill-ventilated portion of the town of Portsmouth. It is built in closed squares, an arrangement by which the circulation of air is still further impeded.

It stands on 1A. 3R. 6P. of ground.

The barrack consists of two wings, the right and left wing.

In the former there are 51 barrack-rooms, and in the latter there are 14, the whole giving accommodation for 912 men.

The rooms vary considerably in size.

In the right wing they are from 7 feet 9 inches to 10 feet 6 inches in height. The majority being about 10 feet high. In the left wing their height varies between 10 feet 6 inches and 15 feet.

The majority of the rooms in the right wing are 24 feet 6 inches long by 18 feet broad. There is one room 82 feet long, 18 feet 6 inches wide, and only 9 feet high.

The rooms in the left wing are 41 feet 6 inches long, by 22 feet broad.

The general appearance of these rooms is that of close, low, dirty, ill-lighted, and ill-ventilated apartments, and there is an air of discomfort in most of those we entered.

There are no means of ventilation, except the doors and small windows.

Only in the upper rooms have any attempts at ventilation been made, and these are most unsatisfactory.

All the barrack-rooms are lit with candles.

The following is the allotment of the accommodation in Clarence barrack :—

| Rooms. | Regulation Number of Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation. |
|---|---|---|---|
| Right Wing. | | | |
| 1 - - | 19 | 15 | 4 |
| 2 - - | 20 | 25 | — |
| 3 to 6 - | 78 | 56 | 22 |
| 7, 8 - | 36 | 26 | 10 |
| 9 to 13 - | 64 | 55 | 9 |
| 14 - - | 12 | 9 | 3 |
| 15 - - | 15 | 12 | 3 |
| 16 - - | 14 | 11 | 3 |
| 17 - - | 15 | 9 | 6 |
| 19, 20 - | 16 | 12 | 4 |
| 21, 22 - | 20 | 16 | 4 |
| 23, 24 - | 18 | 16 | 2 |
| 25, 26 - | 16 | 12 | 4 |
| 27, 30 - | 36 | 32 | 4 |
| 31, 32 - | 14 | 12 | 2 |
| 33, 36 - | 36 | 28 | 8 |
| 37, 38 - | 14 | 14 | — |
| 39, 40 - | 16 | 14 | 2 |
| 41 - - | 8 | 7 | 1 |
| 43, 44 - | 14 | 10 | 4 |
| 45 - - | 8 | 7 | 1 |
| 46, 47, 48 | 27 | 21 | 6 |
| 49 - - | 8 | 6 | 2 |
| 50, 51 - | 16 | 14 | 2 |
| 52 - - | 14 | 11 | 3 |
| 53 - - | 30 | 23 | 7 |
| Left Wing. | | | |
| 1 - - | 24 | 23 | 1 |
| 2 - - | 24 | 17 | 7 |
| 3, 4 - | 48 | 46 | 2 |
| 5, 6 - | 48 | 34 | 14 |
| 7 - - | 24 | 16 | 8 |
| 8 - - | 16 | 13 | 3 |
| 9 to 12 - | 96 | 92 | 4 |
| 13, 14 - | 48 | 32 | 16 |
| Totals 65 | 912 | 746 | 171 |
| Deduct excess of accommodation in No. 2 room, right wing - - - - - - | | | 5 |
| | | | 166 |

From this table it appears that all the barrack-rooms except right wing, No. 2, are overcrowded. No. 2 room has five fewer men than it would hold.

The total regulation number of men is 912, but the total available accommodation at 600 cubic feet per man is for 746 men, leaving an excess of 171 — 5 = 166 men, as representing the amount of overcrowding in the barrack.

The water supply of this barrack is derived partly from rain water, and partly from the public water-works.

The buildings are drained only into cesspools.

The privies were very offensive at the time of our inspection ; they are situated on one side of the court, close to one of the kitchens, and the effluvia from them pervaded the kitchen while the cooking was going on. They are emptied by contract. Nothing could be worse than was the condition in which we found them.

Privies, ash-pits, and urinals were all filthy, and the whole require reconstruction and drainage.

The kitchen referred to above is a small, confined, dark apartment, 10 feet high, damp, partly below the level of the court, and close to the privies as already stated.

It is supplied with boilers, but has no other means of cooking.

There is no bath-room, no day-room, no covered shed for drill.

The laundry has coppers, but no other fittings.

There is a school-room for adults, and another for infants.

A room is occasionally used as a library.

There are 12 small rooms for staff and other serjeants, but there is no accommodation for married soldiers.

Clarence barracks are as a whole in very bad condition, and much of the structure hardly admits of improvement. The buildings in their present state are not suited for barracks, and the best thing to do would be to provide others and vacate them.

As this cannot be done at once, *we consider it to be essentially necessary to carry out the following Improvements* :—

1. Reduction of numbers in the barrack-rooms to the extent already stated.
2. The ventilation of every barrack-room, guard-room, and school-room, by shafts carried up through the ceiling to the roof of the building, fresh air being at the same time admitted and diffused near the ceiling.
3. Sewerage of the barracks, and the abolition of cesspools.
4. Reconstruction of privies, and the introduction of water latrines with flushing apparatus, and division of seats and half-doors.
5. Reconstruction of urinals, with water laid on.
6. Abolition of ashpits. There is no place in these barracks where refuse can be safely retained. Iron carts to collect and remove the refuse daily are required.
7. Kitchen to be provided with roasting apparatus.
8. Additional supply of baths in a suitable room, with water laid on.
9. Laundry to be supplied with fittings, and with a proper drying closet, or drying stove.

## 6. FORT CUMBERLAND.

This fort is situated close to the sea, and has accommodation for 621 men. It covers an area of 7A. 1R. 33P.

The parade of the fort is level with the ordinary spring tides, and the ditch is 4 feet below them. Spring tides have been known to rise two feet above their ordinary level. These circumstances render the drainage of the fort a matter of difficulty.

The barracks are all casemated, and were at the

time of our inspection chiefly occupied by the Royal Marine Artillery.

Thirty-one of the casemates are used as barrack-rooms. They are from 38 to 40 feet in length, about 14 feet broad, and 9 feet 4 inches high. Each casemate has one fireplace in the middle of its length. From the structure of the casemates the windows are placed at each end of the rooms; they are small and low, and not sufficient for ventilation, especially at night.

The number of men in each room is, in the majority of cases, 17; in a few it is 21 and 29. The cubic space per man is, in the majority of instances, 248½ cubic feet; in a few it is a little less or a little more; in all it is very insufficient; but this defect, and also the structural deficiencies in the means of ventilation, are to a certain extent counterbalanced by the airy and exposed position of the fort.

The following accommodation is deficient in these barracks :—

Day-room, library, baths, cleaning-room, and shed for drill.

There are no means of roasting or baking meat in the kitchens.

The privies have open soil-pits emptied by night carts. They are very noisome.

They are drained into a cesspit in the ditch, the surface of which is occasionally overspread by sewage water, and is supposed lately to have occasioned several cases of fever in the fort. The ablution-room is dark and damp. The guard-room is without any opening at the back, and is, in consequence, close and unventilated.

There is a hospital belonging to Fort Cumberland, situated in the middle of the ground. It requires ventilation.

In our opinion casemated barracks should, as far as possible, be kept for defensive purposes, and they should not be occupied by men to the same extent as might be necessary during a siege.

We make no scruple, therefore, in advising a large reduction of numbers in the casemates at Fort Cumberland, by allotting 600 cubic feet per man. At this rate the following table shows a comparison between the existing accommodation, and what it ought to be for health :—

| Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation. | Present Number of Men in each Casemate. | Proposed Number of Men in each Casemate. |
|---|---|---|---|---|---|
| No. | | | | | |
| 1 - - | 21 | 9 | 12 | 21 | 9 |
| 7 and 10 - | 42 | 16 | 26 | 21 | 8 |
| 11 and 32 - | 58 | 22 | 36 | 20 | 11 |
| 24 and 27 - | 58 | 24 | 34 | 29 | 12 |
| 26 remaining rooms. | 442 | 182 | 260 | 17 | 10 |
| Total 33 - | 621 | 253 | 368 | — | — |

At 600 cubic feet per man the 33 occupied casemates would hold no more than 253 men, and, deducting two casemates, used by the officers' messman, and by the serjeant's mess, the accommodation would be 253, minus 14, equal to 239 men.

*We recommend therefore :—*

1. That the numbers be reduced to the extent mentioned.
2. That each casemate, including the guard-room, be ventilated by an air-shaft, and by openings for supplying fresh air through perforated zinc at each end of the casemate.
3. That the privies be converted into water latrines, with self-discharging apparatus at low tide.
4. That a better ablution-room be provided.
5. That the kitchen be supplied with the means for roasting and baking.
6. That the hospital wards be ventilated by air-shafts and inlets for fresh air near the ceiling.

## 7. POINT BATTERY.

The barrack in this battery consists of four casemates, each 37 feet 8 inches long, 19 feet broad, and 12 feet 9 inches high. Each casemate holds 20 men, with 456 cubic feet per man. There is one window and one door to each room, and there are at present no other means of ventilation.

The following is the accommodation :—

| No. of Casemates. | Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 4 | 80 | 60 | 20 |

The casemates are situated in a circumscribed area, in an angle of the works, and there is no space on which to construct conveniences. There is no accommodation for married non-commissioned officers or soldiers. There is no cleaning-room.

The latrines are emptied by night carts.

The lavatory has no water laid on. It has to be carried from the pumps. There is no bath.

The kitchen has no means of cooking except by boiling.

*We recommend the following Improvements :—*

1. To give 600 cubic feet per man by removing five men out of each casemate.
2. The rooms to be ventilated by means of a shaft; fresh air being admitted through perforated zinc, at the ends of the casemates.
3. The kitchen to be provided with a small range, containing a roasting oven.
4. A water latrine and flushing apparatus is required instead of the present unwholesome privy.
5. A bath should be provided, and water laid on to the lavatory.

## 8. BLOCKHOUSE FORT, GOSPORT.

This fort is situated in an open, airy position on the western side of the entrance to Portsmouth harbour, and encloses within its walls 5A. 0R. 21P. of ground.

The barrack accommodation consists of five casemates, occupied by artillerymen, and two casemates occupied by staff serjeants. Each casemate is 32 feet 5 inches long by 27 feet 2 inches broad, and 13 feet 5 inches high to the summit of the arch. The regulation number of men in each casemate is 18, giving 650 cubic feet per man, and the casemates accommodate 92 men in all. At the time of our inspection the rooms were occupied by 17 men each. The casemates have each two windows and a fireplace.

The cubic space allowed for the men is sufficient; the casemates are spacious and lofty; but they might be improved in their ventilation by admitting air at each end, and providing an outlet for it by a shaft near the centre.

The kitchen is too small. It is provided with boilers, but has no other means of cooking rations. The water supply is derived partly from wells, partly from rain-water.

Blockhouse fort is deficient in the following accommodation :—

Library, day-room, school-room (there is one proposed), baths, laundry, cleaning-rooms, covered shed for drill, and workshops.

There is no separate accommodation for sleeping and mess of non-commissioned officers.

The privy is dark, and was noisome at the time of our inspection. It is only flushed at spring tides.

It would be a great improvement to convert this privy into a water latrine, and to flush it out daily.

*The Improvements we would recommend for Blockhouse Fort are the following :—*

1. Ventilation of casemates, as already mentioned.
2. A small cooking range to be provided for the kitchen This would enable the present boilers to be removed, and would give additional space in the kitchen.
3. A bath to be provided.
4. Privy to be converted into a water latrine, with flushing apparatus, and to be flushed daily.

## 9. FORT MONCKTON, GOSPORT.

The area of Fort Monckton within the glacis is 12A. 1R. 17P.

The barracks consist partly of casemates and partly of rooms constructed above them.

There are 11 casemated rooms occupied by privates, and two casemated rooms are used by staff serjeants. One is occupied as a tailor's shop. Each casemate is 28 feet long, 12 feet wide, and 9 feet 2 inches high to the crown of the arch, and contains about 2,800 cubic feet of space. The regulation number of men in these rooms is nine men per room, with an allowance of about 313 cubic feet of space per man. At the time of our inspection they were occupied by seven men each. The rooms have only one small window, 2 feet 6 inches high. These windows are hung folding, and, with the door and fire-place, constitute the only means of ventilation.

The rooms above the casemates are somewhat better suited for their purpose. They are 19 in number, one of which is intended for a library. With two exceptions, they contain less than 2,700 cubic feet each. The two largest rooms have a capacity of 5,968 and 6,755 cubic feet respectively. All the smaller rooms accommodate, by regulation, nine men each, except one which holds eight men. The two large rooms accommodate 18 and 20 men.

The cubic space per man in all the rooms, with one exception, is under 300 feet, and in the exceptional case it is 375 cubic feet per man. The total accommodation by the present regulation, in the occupied rooms of Fort Monckton, is therefore as follows :—

| | Regulation Number of Men. | Number at 600 Cubic Feet each. | Deficiency of Accommodation. |
|---|---|---|---|
| Casemates - 11 | 99 | 44 | 55 |
| Upper Rooms, except Nos. 15 and 20 - 17 | 152 | 68 | 84 |
| Nos. 15 and 20 - 2 | 38 | 21 | 17 |
| Total - 30 | 289 | 133 | 156 |

There are neither day-room nor baths in these barracks, and there is no covered shed for drill.

The ablution-room is too small.

There is no special ventilation in any of the rooms.

The privies are dark and very noisome, and require to be removed from their present position, in the body of the building, under the rooms, to the inmates of which they are very offensive, owing to the soil being only precariously washed away by the tide.

The kitchen is situated in an excellent building, but has no means of cooking, except boiling.

The water supply is derived from fresh and salt water pumps, and is considered sufficient.

The drainage is very defective, and requires careful examination and reconstruction. At times, the tide flows over part of the square, and, at the period of our inspection, foul water was lying in the gutters, directly under the windows.

There is no accommodation provided for married non-commissioned officers and soldiers, and as the regulated number of wives accompany the regiment in occupation, they have to be put into any place that can be found for them. The quarters occupied by women and children, when we were at Fort Monckton, were very bad, and certain of them unfit for human habitation.

Much inconvenience is experienced for want of a serjeants' mess.

*The following Improvements we consider necessary for these Barracks :—*

1. Reduction of numbers in the casemates from nine men to four in each. This will give more than 600 cubic feet per man, but five men would be too many, and that number would have less than 600 cubic feet per man.

In the rooms above, the numbers should be reduced from nine to four in the smaller rooms ; from 18 to 11 in room No. 15 ; and from 20 to 12 in room No. 20.

2. Ventilation of each casemate by a large square Arnott's valve into the chimney. The air being admitted by the inlet, at either end, covered with perforated zinc.

For the upper rooms, a ventilating shaft from each room, to be carried from the ceiling to the roof, and air to be admitted by openings, protected by perforated zinc, near the ceiling, and at a distance from the shafts.

3. Improvement in the drainage of the fort.
4. Removal of privies from their present site, and the construction, in a more suitable locality, of water latrines with means of daily flushing, and with divisions of seats and half-doors.
5. Kitchen to be provided with means of roasting and baking meat.
6. Wash-house to be provided with a laundry stove.
7. Two baths to be provided.

Lastly, it would be very advisable to provide some accommodation for a serjeant's mess, and also for soldiers' families, as the present accommodation is wholly inadequate.

## 10. HASLAR BARRACK, GOSPORT.

Haslar barrack covers an area of 5A. 0R. 1P., and consists of six detached blocks one story high, well separated from each other, with one large and two small rooms in each, containing 21 and 13 men, by regulation, respectively.

There are, in all, 23 barrack-rooms occupied by soldiers. One room is occupied by the serjeant-major and one by the quartermaster-serjeant.

The barrack-rooms are of three dimensions. No. 1 room in each of the six blocks has 10,484 cubic feet of contents, and accommodates, by regulation, 21 men, giving to each man 499 cubic feet of space.

Rooms Nos. 2 and 3 in each of the blocks hold 13 men each, with 507 cubic feet per man, and the rooms No. 4 hold 13 men each, with 499 cubic feet per man. Each block, with one exception, accommodates 60 men, so that the men are barracked in six separate buildings, which is a most excellent arrangement so far as concerns their health. The total regulation accommodation in the six buildings, exclusive of non-commissioned officers, is for 346 men.

Haslar barrack is deficient in baths, laundry (there is only a wash-house), and covered shed for drill.

There are no means in the kitchen of baking or roasting meat.

The sewage flows into cesspools, and the drainage is defective.

The privies require much improvement.

The school-room is good, but not well ventilated.

All the barrack-rooms require ventilation, which could be very easily carried out through the roof.

The ashpit is badly placed.

The ablution-house is dry, light, and spacious.

There is no special accommodation in these barracks for soldiers' wives.

The chief defect in the men's rooms of this barrack is want of ventilation, otherwise the principle on which the barrack is constructed, namely, that of quartering the men in a number of separate buildings, at a good distance from each other, gives it great advantages for health. Under such an arrangement, and considering the exposed airy position of the barrack, it is not necessary to set aside such an amount of cubic space per man as we have had to recommend in town barracks of the ordinary construction.

With proper ventilation the present number of men might be accommodated with safety, provided there were some re-arrangement whereby the space could be more equally distributed.

*We would recommend the following Improvements in this Barrack :—*

1. Ventilation in every barrack-room, by louvred turrets in the roof, and means of admitting fresh air near the ceiling. School-room to be similarly ventilated.
2. Abolition of all cesspools, and direct drainage to the sea.
3. Removal of privies to a better site, and their reconstruction as water latrines, with divisions of seats and half-doors.
4. Kitchen to be provided with means of baking and roasting meat.
5. Three baths to be provided.
6. Ashpit to be placed at a greater distance from the buildings, and more frequently emptied.

Lastly, it would be advisable to provide quarters for married non-commissioned officers and soldiers, and a mess-room for non-commissioned officers. Also a drying stove for the wash-house.

*Haslar Barrack Hospital.*

This hospital is built like an ordinary dwelling-house, and stands on ground somewhat lower than the barrack. It is not in very good repair, and requires improvement in some essential particulars.

It contains four wards and four nurses' rooms, which latter are not occupied by the orderlies ; for, contrary to every sound principle, the orderlies sleep in the wards, and thus occupy ward space which is required for the sick.

Each ward accommodates, by regulation, 10 sick, with a cubic space varying from 640 to 740 cubic feet, as follows :—

| — | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet. | Deficiency in Bed Spaces. |
|---|---|---|---|
| Wards 1, 2 | 20 | 12 | 8 |
| „ 3, 4 | 20 | 10 | 10 |
| 4 | 40 | 22 | 18 |

There is no lavatory attached to the building, and the sick wash in the wards.

There is no slipper bath. There is one shower bath not in repair.

The washing is done in the barrack wash-house.

The kitchen is supplied only with coppers for boiling diets.

The water supply of the hospital, like that of the barrack, is derived from a well.

There are no waterclosets in the hospital ; there are only close stools, and privies outside ; the drainage is defective.

The wards have each a ventilator in the ceiling, but, as there is no proper inlet for the air, the current in the ventilator is down in place of up, and causes draughts.

There is no accommodation for the sick of soldiers' families.

*This Hospital requires for Improvement :—*

1. Reduction of number of inmates, to give 1,200 cubic feet of space for each bed.
2. Ventilation, by shafts from the ceiling of each ward, with means of introducing fresh air near the ceiling.
3. A proper lavatory and bath-room.
4. Water-closets, with proper drainage to the sea.

Lastly. Orderlies to sleep out of the wards ; and, if practicable in the present buildings, accommodation for the sick of soldiers' families to be provided.

## 11. GARRISON HOSPITAL, PORTSEA.

This hospital was constructed to accommodate 316 sick. It is built across the opening of one of the bastions, in a situation which though, perhaps, as good as was to be had within the lines, is objectionable, on account of the want of free circulation of air round the building.

It stands on 2A. 2R. 30P. of ground.

The hospital consists of three flats. There is an open corridor running along the front, on the three stories, looking to the south-west, and from which doors open into passages leading to the wards. These passages are connected through the whole height of the building by internal wooden staircases.

The hospital is divided into what are called four "houses," A, B, C, and D, and it contains 25 wards. Twenty-two of these wards are no more than 11 feet high, and the other three wards are only 9 feet 11 inches high. The other ward dimensions vary considerably. Fourteen wards are 48 feet long by 22 feet broad, and have 11,616 cubic feet of contents. They contain 17 sick each. Eight wards are 21 feet 7 inches long, six of these are 20 feet broad, and two 22 feet broad, with six sick in each. Two wards are 25 feet 10 inches by 22 feet, with nine sick in each, and one ward is 28 feet long by 22 feet broad, with 10 beds. The smallest amount of cubic space per bed is 611 cubic feet, and the largest 791. The average is about 698 cubic feet.

The following table shows the present ward accommodation as contrasted with what it ought to be with 1,200 cubic feet of space set apart for each bed :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation for Sick. |
|---|---|---|---|
| A House 1 - | 6 | 3 | 3 |
| 2, 4, 5, 7 | 68 | 40 | 28 |
| 3, 6 - | 12 | 8 | 4 |
| B House 1, 2, 5 | 51 | 30 | 21 |
| 3, 6 - | 19 | 10 | 9 |
| 4 - | 7 | 4 | 3 |
| C House 1, 2, 3 | 51 | 30 | 21 |
| 4 - | 7 | 4 | 3 |
| 5 - | 9 | 5 | 4 |
| D House 1 - | 6 | 3 | 3 |
| 2, 4, 5, 7 | 68 | 40 | 28 |
| 3, 6 - | 12 | 8 | 4 |
| Total 25 - | 316 | 185 | 131 |

Ten of the largest wards have four windows, each 6 feet 6 inches high by 3 feet 11 inches wide. Two of these windows are placed at each end of the ward, with a fireplace between them. The distance between the opposite windows is 48 feet, and the beds are arranged along the dead walls. Four of the largest wards have six windows in each. Of the

smaller wards some have two and some three windows in each, with one fireplace. Three wards are misappropriated for hospital serjeant's rooms, as there is no other accommodation for them.

The means of natural ventilation by doors and windows are exceedingly defective in this hospital, on account of its construction. In most of the wards the window space is too small for the cubic contents, and we are not aware of any hospital in which the distance between opposite windows is so great as in this. It is 18 feet more than is the distance in the best constructed hospitals. The wards are too low in proportion to their other dimensions. It would be difficult to ventilate the larger wards, even by open windows, unless there was a considerable movement in the outer atmosphere. To supply this defect ventilating openings have been made in the floors and ceilings, communicating with the external air, and chimney valves have been introduced; but all are under the command of the men, and consequently closed, and with all these appliances, therefore, the ventilation is very deficient.

The hospital has patent self-acting water-closets and urinals to each flat, well placed beyond the outer wall of the building, and properly ventilated, the drainage of which is conveyed away in earthenware pipes and barrel drains, trapped, and not passing under the main building, and is discharged into the sea.

Detached from the hospital is a latrine, drained into a cesspool, with an overflow pipe.

The lavatory is situated in an imperfectly lighted room on the ground-floor, and is very inferior in its arrangements to the lavatory in the hospital of the Scots Fusilier Guards in Westminster.

There is no bath-room and no suitable bathing accommodation.

The kitchen is good and well provided with cooking apparatus.

The water supply is derived from a water company, and is received into tanks.

The laundry arrangements appear sufficient.

The chief sanitary defects of this hospital are overcrowding and imperfect ventilation, to which must be added want of suitable baths and lavatories, and the existence of a privy and cesspool within the precincts of the building.

*We are of opinion that the following Improvements are requisite:—*

1. Reduction of the number of beds in all the wards, as laid down in the preceding table, which will give in some wards a little more, and in some a little less, than 1,200 cubic feet per bed.

These changes, proposed in accordance with our instructions, would necessitate the removal of 131 beds out of the building.

2. We propose to light and ventilate all the staircases through the roof. In order to obtain the means of supplying fresh air to the middle of the wards, which cannot be done at present, we would propose to make a sufficiently large ventilating opening into each ward, over or near the top of the door, provided with means for diffusing the air; also to make additional openings, with means of diffusing the air through the external walls where necessary; and to carry up ventilating shafts in suitable positions from the ceiling of each ward through the roof of the building. The air in the lobbies and staircases might be warmed, if necessary, by stoves in cold weather.

3. A suitable bath-room should be provided, with hot and cold water laid on.

4. Lavatories to be improved.

5. Cesspool to be removed, and the privy connected with it to be converted into a water latrine to be flushed into the sewers.

## 12. WINCHESTER BARRACKS.

Winchester barracks are situated in a dry, elevated, airy position, and are included in an area of 15A. 1R. 25P. of ground. They consist of one large building, with officers' quarters partly within it and partly detached.

The barrack is traversed by wide lofty passages, out of which open small courts containing the kitchens. The barrack-rooms are on four floors, including the ground floor, and are entered from a corridor within the building, which extends down each side, and is lighted from the courts by ordinary windows. The various flats of barrack-rooms are reached by wooden stairs inside the building, each stair communicating with all the floors.

There are in all 119 barrack-rooms, having very nearly the same superficial area to each room, but varying in height between 9 feet 6 inches and 13 feet 9 inches; and as all the rooms contain the same number of men by regulation, namely, 14, the cubic space per man varies considerably in the different rooms.

The following is the arrangement of the accommodation:—

There are 12 barrack-rooms on the ground floor; on the first floor there are 33 rooms; on the second floor there are 34 rooms; on the third floor there are 40 rooms.

The building has regulation accommodation for 1,666 men. The amount of cubic space per man varies in each floor; it is 464, 354, 375, and 339 cubic feet in the floors, beginning from the ground upwards.

The accommodation, according to the present regulation, as compared with what it would be at 600 cubic feet per man, is as follows:—

| — | Rooms. | Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|---|
| Ground Floor | 12 | 168 | 132 | 36 | 14 | 11 |
| 1st Floor | 33 | 462 | 297 | 165 | 14 | 9 |
| 2nd Floor | 34 | 476 | 306 | 170 | 14 | 9 |
| 3rd Floor | 40 | 560 | 320 | 240 | 14 | 8 |
| Totals | 119 | 1,666 | 1,055 | 611 | — | — |

There is, therefore, a deficiency of accommodation for 611 men. In reducing the numbers it would be necessary to remove three men out of every ground-floor room; five men out of each first-floor room; five men out of every second-floor room; and six men out of every room on the top floor.

Ventilation is provided for in this barrack by swing windows, and by ventilating beams perforated with holes. If the number of men in each room were reduced, we should feel disposed to try the sufficiency of the present ventilation with the remainder before making any change in it; with the present number of men the ventilation is insufficient.

At the time of our inspection eight barrack-rooms were misappropriated for barrack stores, serjeants' quarters, &c., and nine rooms were temporarily misappropriated for other purposes.

The whole barrack is lit by candles.

There is no day-room for the men.

There is one school-room and one library.

There are two lavatories in the sunk basement of the building; they are reached by steep stairs descending from the courts; they are dark, damp, and unsuitable for the purpose. The bath accommodation is deficient, as there are only two iron baths for the whole barrack.

There is no laundry belonging to the establishment.

There are four cook-houses, two on each side, with eight boilers in each, but there are no means of roasting or baking meat.

There are no cleaning-rooms, or covered sheds for drill.

The water supply is derived from the Water Company's Works.

The surface drainage from the buildings is carried by trapped drains into the main sewers, which empty themselves into the river.

There is one large latrine of recent construction, situated on the slope below the level of the barrack. It is properly supplied with water and flushed, but the contents do not pass into the sewers on account, as we are informed, of local objections to polluting the river. The drainage is, therefore, led into a cesspool, situated considerably below, but at no great distance from, the barracks, and as there is no outlet, the contents sometimes overflow the surface of the ground and occasion nuisance ; this cesspool requires, it is stated, 10 days and nights for emptying ; it is a serious nuisance and ought to be abated. If there are insurmountable difficulties to obtaining an outlet for the whole drainage of the latrines, the cesspool ought to be removed to a greater distance, its fluid contents deodorized and drained away into the sewers, and the solid residue carted away for manure.

Non-commissioned officers have no separate sleeping apartments in this barrack.

The old hospital, situated below the barrack, in a very damp, unhealthy position, is now appropriated for 42 married soldiers. It is a one-story building, consisting of large rooms, which several families occupy in common, and is not suitable for the purpose.

We have adverted to the crowded condition of these barrack-rooms, and stated that 17 rooms are misappropriated for various purposes. If these rooms were restored to the barrack, they would accommodate probably 160 or 170 men, and would reduce the deficiency of accommodation to that extent. Of course it would be necessary to provide otherwise for the present occupants of these rooms.

*The following are the Improvements we would recommend in regard to these Barracks :—*

1. Reduction of overcrowding and allotting 600 cubic feet of space per man, according to our instructions. There are some dark rooms which would be better used for other purposes than barrack-rooms.
2. Lighting the barrack with gas.
3. Removing the kitchens from the interior of the courts to a more suitable locality, and providing them with means of roasting and baking meat.
4. Removal of the lavatories from the basement. Suitable lavatories, with bath-rooms properly supplied with baths, and having a covered communication with the passages, might be easily constructed in the courts.
5. Drainage of latrines to be improved in the manner suggested.
6. One or more day-rooms to be provided, also a covered shed for drill.
7. Married quarters to be improved, or reconstructed on better principles, as at Anglesey barracks, Portsmouth, or the Guards' model lodging house, Westminster.

### *Winchester Barrack Hospital.*

This is a new hospital adjoining the barracks, but not in so good a position. The ventilation outside is liable to interruption by adjoining walls ; the hospital is close to the higher end of the town, and is not quite so well placed as the barracks.

The building is three stories high, and consists of wards and corridors. The corridors cover the northern face of the building, and derive their light and air through ordinary windows. The three flats of corridors communicate by a staircase extending from top to bottom of the building, and the wards enter from the corridors by doors, over which are swing windows for ventilation. The wards have windows to the open air only on one side, except the end wards of each flat, which have windows at opposite ends ; the distance between the opposite windows in the larger wards is 37 feet, a distance much too great for natural ventilation to be efficiently carried out ; the shorter wards are ventilated partly into the corridors, and partly into the open air, as already mentioned. Half of the wards are 12 feet high, and half are 12 feet 6 inches high.

The whole structure of this hospital renders natural ventilation difficult, although means have been introduced to facilitate it in every ward.

Thus every window in the building has a perforated glass pane in the upper tier of glass. The four larger wards have four gratings each near the floor, for admitting fresh air, and the eight smaller wards have each two similar gratings. Each ward on the second floor has a perforated plate in the ceiling, and, as already mentioned, there are swing fanlights and windows between the wards and corridors.

Notwithstanding these arrangements, the hospital ventilation was defective at the time of our visit.

There are in all 13 wards.

The itch ward on the ground floor has seven beds. The two larger wards on each of the first and second floors have 13 beds in each, and the four smaller wards in each floor have 10 beds in each.

The lowest amount of cubic space per bed is 442 cubic feet in the itch ward. In the other wards the cubic space per bed is 734, 764, 792, and 825 cubic feet per bed.

The wards are lighted with gas, and warmed by the Anglo-American fireplace.

There is a lavatory and bath-room, with hot and cold water laid on.

The kitchen appears to be sufficient for the hospital cooking.

The water supply is stated to be abundant and good.

Each floor is supplied with self-acting water-closets, and there is a water latrine properly constructed in the court behind. The drainage is conveyed into a cesspool outside the hospital precincts ; but as this arrangement is inadmissible, we should advise, if possible, the hospital drainage to be connected with the barrack drainage, when it is improved as already recommended, and the whole soil to be deodorized and removed at the same point.

The hospital is too small for the barracks, even on its present scale of accommodation.

It contains in all 132 beds ; but as the orderlies, contrary to all sound rule, sleep in the wards, 12 beds are occupied by them, and must be deducted, so that there are only 120 beds for sick.

But, as the following table will show, this number of beds is much more than the building ought to contain, in conformity with our instructions to allot 1,200 cubic feet per bed.

| —— | Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Space. |
|---|---|---|---|---|
| 1st Floor | 2 | 26 | 16 | 10 |
| | 4 | 40 | 28 | 12 |
| 2nd Floor | 2 | 26 | 18 | 8 |
| | 4 | 40 | 28 | 12 |
| Ground Floor | Itch Ward. | 7 | 4 | |
| Total | 13 | 139 | 94 | 45 |

In order to diminish the overcrowding, the following reduction in numbers is necessary :

The itch ward at the very outside should contain no more than four beds, instead of seven, and this would give considerably less than the cubic space mentioned.

The four smaller wards on the first floor to have at the outside seven beds in each, 28 in all, instead of 40

as at present. This would give about 1,130 cubic feet per bed.

The two larger wards on the first floor to have eight beds in each, or 16 beds instead of 26, which would give a fraction less than 1,200 cubic feet each. The four smaller wards on the second floor to have seven beds in each, that is, 28 beds instead of 40, giving a cubic space of less than 1,200 feet. The two larger wards on the second floor to have nine beds in each, that is, 18 beds in the two, instead of 26, as at present ; this would give about 1,100 cubic feet per bed.

The total accommodation for sick, when the orderlies are removed from the wards, as they ought to be forthwith, will, therefore, amount to 94 beds, which is an extent of accommodation much too small for the strength in barracks.

*We recommend the following Sanitary Improvements to be carried out:—*

1. Reduction of numbers of beds in the manner mentioned.
2. Ventilating every ward and corridor by shafts carried from the ceiling above the roof of the building, closing up all the air bricks near the floors of the wards, and admitting sufficient air by suitable inlets near the ceilings to supply the ventilation.
3. Improving the drainage as already mentioned.

These changes will remove, as far as practicable, the more obvious defects of the building ; but there are others which also require removal.

The hospital accommodation requires extension.

There are no small wards for isolated cases of sickness.

There is no waiting-room for sick men, who on arrival at hospital are obliged to stand about the cold passages and stairs.

There is a covered ambulatory for convalescents exercising in wet weather ; but it cannot be used because there is no covered communication between it and the hospital ; its chief use is, therefore, limited to drying clothes in wet weather.

There is no accommodation for the sick of soldiers' families.

There are no orderlies' rooms.

It appears to us that these deficiencies ought to be supplied, and that steps should be taken to extend the hospital on a better plan than the present, to make the accommodation more commensurate with the requirements of the barracks.

## HILSEA BARRACK, PORTSMOUTH.

This is a barrack for Royal Artillery. It is situated on the east side of Portsmouth Harbour, at its northern extremity, on low, badly drained ground, at a short distance from a muddy tidal creek.

The district is exposed to malaria, and intermittent fever occurs among troops in occupation.

The barracks are of brick, and consist of a single line of buildings two stories high, the stables occupying the lower story. The men's rooms are over the stables, and are reached by an outside staircase at one end leading to a long wooden balcony, on which the room doors open. A block of recently constructed buildings at right angles to the main line contains the cook-house and school-room. In front are a number of cottage-looking structures, which were being adapted, at the time of our inspection, for ablution and bath rooms, &c. Another two-story range of old buildings close to these contain the stores, over which, in attics resembling ordinary lofts, is the present hospital accommodation. There is a good parade and exercising ground behind the men's rooms. The officers' quarters are in an old detached residence outside the barrack enclosure.

There are five men's rooms, with regulation accommodation for 25 men each, at 474 cubic feet per man. Each room is 40 feet long by 28 feet broad, and 10 feet 7 inches high.

The rooms have each five windows, three at one end, and two windows and the door at the opposite end. The distance between the opposite windows is 40 feet, and the beds are ranged along the dead walls.

The following table shows the total accommodation in contrast with what it would be at 600 cubic feet per man :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 6 | 150 | 120 | 30 |

By giving a fraction under 600 cubic feet per man, each room will hold 20 men instead of 25, and the total accommodation in the barrack will be sufficient for 120 men instead of 150, as at present.

There are two openings in the ceiling of each room for ventilation. They are covered by moveable boards, but are not sufficient, as the rooms were close, and defectively ventilated. Two inlets are required, one at each end of the room, and a remodelled grate for warming part of the air in winter. Were these improvements carried out, and the numbers of men reduced to 20 per room, the rooms would be sufficiently ventilated.

The stables below also require ventilation by shafts carried one from each corner above the roof.

The rooms are lighted with candles. When the projected extension of these barracks is carried out gas should be laid on to them.

At the time of our inspection proper lavatory and bath accommodation was being fitted up.

The women's wash-house was also undergoing an entire remodelling, to make it more suitable for the requirements of the barracks.

A new cook-house, suitably provided with boilers and ovens, was being completed.

Next to it and under the same roof, a new school-house was also being completed.

These various improvements had been very much required, and will add materially to the health and comfort of the soldier.

There are three workshops, for collar maker, wheeler, and blacksmith. All require ventilation through the roof.

There are two sources of water supply, one from wells within the boundary, the other from the company's mains. When the barrack is extended a larger supply pipe will be required, and the water should be laid on at pressure.

The barrack drainage is in a very imperfect condition. The privies are wholly undrained, and are connected with the manure pits, the whole being emptied from time to time by contract. Even the surface drainage, and that from the ablution-room, wash-house, &c., although conveyed under ground by earthenware pipes, is discharged into cesspits, the overflow from which escapes into ditches in the vicinity of the barrack. One of these open ditches forms the boundary of a narrow field outside the barrack wall on which it is proposed to extend the accommodation. This ditch ought to be drained and filled up.

The obvious course to take in this case is to drain the whole barrack to an outlet which can be obtained at no great distance ; to convert all the privies into water latrines, and to fill up the cesspits.

There are two living rooms for non-commissioned officers, but no mess-room.

Ventilation for the guard-room is required by a shaft and remodelled grate.

The cells require warming by a stove in the passage.

Taken as a whole, this barrack cannot be considered a good one. Its position is not such as would be selected simply from considerations of health; but there are extensive defensive works being carried out in the immediate vicinity for which barrack accommodation will be required. It is hence proposed to extend Hilsea Barracks over the low, flat ground in the vicinity. To enable this to be done with the least risk to health, we would advise the neighbouring ground to be deep drained, so as to obtain a thoroughly dry position for the buildings and their immediate vicinity. All open ditches should be drained by pipes and filled up.

The men's rooms in the new buildings should be well raised above the ground, with a free ventilation beneath the floors. The stables should be separated from the barrack-rooms, and not under them. There should be no cesspits or other accumulations of filth; the surface drainage and guttering should be carefully attended to; all drains should be trapped and ventilated; in short, every precaution should be taken to diminish, by sanitary works, the natural disadvantages of site.

In so far as regards the present buildings, *the improvements required may be summed up as follows:—*

1. Reduction of the numbers of men in each room from 25 to 20.

2. Ventilation of the men's rooms to be improved by carrying shafts from the ceiling openings above the roof. Each room to have two inlets for air, one at each end and close to the ceiling. Each room to have a remodelled grate. Each non-commissioned officer's room to have an Arnott's ventilator. The guard-room to have a shaft through the roof and a remodelled grate. Cells to be warmed by a stove in the passage. Workshops to be ventilated.

3. Stables to be ventilated by shafts carried from the corners of the ceilings to above the roof.

4. Gas to be laid on to the barrack-rooms.

5. Barrack to be drained to an outlet. Cesspits to be abolished. Privies to be reconstructed as water latrines, with divisions of seats, half-doors, light and ventilation. Ditches in the vicinity of the barrack to be drained and filled up. Adjacent ground to be drained.

### *Hilsea Barrack Hospital.*

This hospital is a loft over stores, having nine beds. It is only a temporary place of reception, until the serious cases of sickness can be sent to Portsmouth General Hospital. It is, nevertheless, quite unsuited for its object, and ought to be abandoned as soon as possible. The large addition to be made to the force at Hilsea indicates that increased hospital accommodation is required. A healthy piece of ground should be selected, and a proper hospital built.

In regard to the present building, *we would advise solely—*

That ventilation through the ridge be provided.

## CHRISTCHURCH BARRACKS.

SIR,

IN conformity with our instructions, we have examined into the sanitary condition of the Artillery Barracks, Christchurch, and we have the honour to report on them as follows:—

These barracks are situated in a healthy open country, at about a mile from the town of Christchurch, and are entirely isolated from dwellings of the civil population. They are situated within a spacious enclosure, and are arranged in the following manner:—Near the end of the enclosure facing the entrance gate is a long range of buildings, containing soldiers' rooms over stables, with officers' quarters at one end. Other officers' quarters are contained in a building at right angles to the centre line. Behind the centre range, and sufficiently removed from it, are placed the latrines, wash-houses, canteen, &c.

There are two ranges of stables, besides those in the centre building. These ranges are carried along the parade ground, one range on each side; they run at right angles to the centre range, and bound the parade ground on opposite sides. At the end of one of these stable ranges, nearest the entrance gate, is the hospital.

The men's rooms over the stables consist of one flat, with an attic above. They are reached by a central staircase, on one side of which, on the ground floor, is placed the kitchen, and on the other side an ablution-room.

From the top of the staircase an inner passage branches off right and left, having a single window at one end of it, and abutting against the wall of the officers' quarters at the other end,—so that it has no thorough draft for ventilation. From this dark end a staircase is carried up to the attic above.

The barrack-rooms on the first floor open right and left out of the central passage. These rooms are of the construction usual to cavalry barracks. The door, with a sliding window over it, is close to the fire. Opposite the door is a single sliding window, giving light to the room, and the far end of the room is a *cul-de-sac*, deficient alike in light and in means of renewing the air. In some of the rooms there are blank windows.

There are two attics of the usual form and construction, but better on the whole than any attic barrack-rooms we have seen.

There are altogether nine men's rooms and these two attics, but three of the men's rooms are used for married quarters. The total accommodation is for 145 men and two staff serjeants, but the occupation at the time the return was made to us was below the regulation number. Had the whole regulation number of men been in barracks, and had the three rooms misappropriated for married quarters been occupied at the same time by married people, this misappropriation would have led to great overcrowding.

The following table shows the regulation accommodation in the rooms, exclusive of those occupied by married people, together with the number of men these rooms would contain at 600 cubic feet per man:—

| Rooms. | Present Regulation Number of Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 2, 3 | 20 | 14 | 6 |
| 6, 7, 8, 9 | 44 | 28 | 16 |
| Attics:— | | | |
| No. 1 | 36 | 26 | 10 |
| 2 | 26 | 20 | 6 |
| Totals - | 126 | 88 | 38 |

Rooms Nos. 1, 4, and 5 have regulation space for 17 men, and would afford about 600 cubic feet per man to 13 men. As already stated, they are at present used as married quarters, but if they were restored to the men they would raise the accommodation in this barrack at 600 cubic feet per man to 88 + 13 = 101 men, which is the maximum number the barrack ought to contain. The regulation space, as stated above, is for 145 men, while the total accom-

modation is sufficient for 101 men only, including the married rooms, but exclusive of these rooms there is space for 88 men, and no more.

The rooms are all of one height, namely, 9 feet 6 inches. They have a common breadth of 17 feet, and are from 14 feet 6 to 27 feet 8 inches long. The two attics are respectively 86 feet and 65 feet 6 inches long, 26 feet 6 inches broad, and 7 feet high. The rooms, as already stated, have one window each, and the attics have one 11, and the other 7, windows. The beds are very close to each other, being only 8 or 9 inches from side to side in the rooms and 18 inches in the attics.

Ventilation is to a certain extent provided for in these rooms by openings in the ceiling into a space below the slates, and the rooms are warmed by the old pattern fire-grate. Each attic has a stove in addition to a fire-grate.

The barrack-rooms are much overcrowded in appearance, and neither the ventilating nor warming arrangements are sufficient. The passage and men's rooms are too dark, and the room doors are not properly placed for either comfort or ventilation.

To remedy these defects we propose to place a large ventilating skylight at the top of the stair leading from the inner passage to the attics. We would propose to open the blank windows in the men's rooms on the first floor, and to move the doors from the space next the fire to the opposite end of the room. We would further carry a ventilating shaft of the usual construction from the opening in the room ceiling up through the roof. One inlet for fresh air should also be introduced in the outer wall close to the ceiling, and the fire-grates should be remodelled to warm part of the air admitted.

Some ventilation is provided for the attics by openings round the stove pipes. The area is hardly sufficient. It should be enlarged to afford the requisite section for the number of men in the rooms, and each attic-room should have two inlets for air on each side close to the ceiling. The attic fire-grates should also be remodelled.

A few perforated glass panes should be placed in the end window of the corridor on the first floor.

By these improvements the whole mass of air within the barrack will be kept moving, instead of remaining comparatively stagnant, as is the case at present.

As in other instances where stables are placed under men's rooms, it will be necessary to carry ventilating shafts from the corners above the roof, to provide as far as possible that the stable effluvia shall not pass into the rooms.

The shed stables have their ventilation at the ridge by means of louvres. There are also openings in the wall for admitting air.

There is no regular school-room belonging to this barrack. Any room that can be best spared is allotted for the purpose.

There is no day-room and no library.

The ablution-room, as already stated, is in the centre building, under the men's rooms. It is supplied with water by a pump and tank, and has a slate ablution-table with the ordinary iron hand basins. It requires pegs and gratings.

Two baths have been recently provided in a small building close to the boundary wall behind the centre range. The accommodation is sufficient for the size of the barrack.

The women's wash-house is a shed building of the usual construction. It has no fixed tubs, and no means of drying linen.

The cook-house has eight boilers of the ordinary construction, and a brick oven. It is only eight feet six inches in width, and the range of boilers occupies half of the space.

Water is derived from three wells within the barrack enclosure. It is stated not to be sufficient at times.

The privy accommodation consists of large open sheds, with cesspits and urinals in front. They have no drainage. They should be reconstructed as water latrines and drained to an outlet, or the contents of the latrine should be flushed into a water-tight cart and removed daily, on the Glasgow plan. There is a sewer into which the officer's water-closets are drained, and possibly the same outlet might be adopted for the latrine drainage. All the privies within the enclosure should be improved on the same plan.

There is a very large manure-pit and also an ash-pit behind the barrack range. Both are dug below the surface, and are much too large. We would recommend their being filled up above the level, paved, and drained.

Proper ventilation is required for the canteen rooms. Arnott's valves and perforated panes in the upper window sashes will be sufficient.

The guard-room also requires ventilation by a shaft and remodelled grate.

*The following are the Sanitary Improvements required for this Barrack:—*

1. Reduction of the number of men in each room to afford 600 cubic feet per man.

2. Ventilation and lighting the corridor by a shaft, and ventilating skylight over the top of the stair leading to the attic, and by perforated glass panes in the end windows. Ventilation of the men's rooms by shafts carried from the ceilings above the roof, and by inlets for air. Barrack-room fire-grates to be remodelled to warm part of the air admitted to the rooms.

Canteen tap and non-commissioned officers' rooms to have Arnott's ventilators and perforated panes.

Guard-room to be ventilated by a shaft through the roof and a remodelled grate. Barrack-room doors to be moved to the end of the room furthest from the fire. Additional windows to be opened into the men's rooms.

3. Ventilation of the stables under the men's rooms by shafts carried from the corners to above the roof.

4. Ablution-room to have pegs and gratings.

5. Women's wash-house to have fixed tubs and means of drying linen.

6. All privies to be reconstructed as water latrines, with divisions of seats, half-doors, light and ventilation, and to be drained to an outlet, or their contents flushed daily into a cart and removed. Urinals to be reconstructed and supplied with means of washing and cleansing. All untrapped drains to be trapped, and cesspits to be abolished.

7. Manure and ash pits to be raised above the level of the ground, contracted in size, paved, and drained.

8. It would be very desirable in this, as in similar cases, to remove the cook-house into a separate building, and either to remove the ablution-room or to supply it with fixed basins, to prevent the large wet surface at present exposed within the barrack range.

Lastly some provision of married quarters should be made to prevent the present misappropriation of men's rooms for the purpose.

### *Christchurch Artillery Hospital.*

This hospital is a long, narrow, one-story building, erected against the barrack enclosure wall, at the end of one of the stable ranges. It consists of three wards, a serjeant's room, a surgery, and kitchen, built in line with the windows facing the parade ground. Access is obtained by a passage which runs from the front of the hospital, and terminates behind, in a long inner corridor, one side of which is formed by the barrack boundary wall, and the other side by the wards, &c. The wards are 11 feet 3 inches high, and about 12 feet wide. Their length varies from 9 feet 9 inches to 24 feet 6, and 37 feet 4 inches.

The corridor has a window at the end and skylights above. The wards and office doors open out of it, and most of the ward ventilation is into this corridor, by openings over the doors, so that it is the receptacle of the foul air of the building.

There is no place for convalescents exercising,

except the parade ground in front, or a very small yard, at one end of the hospital, containing the dead-house, the drainage from which is carried along the front of the hospital to an adjacent manure pit. As the hospital latrine is not drained, there is also a cess-pit in this small yard. The yard is not drained, and the surface water escapes by a hole in the boundary wall into a field behind.

The general plan and arrangement of the building are very defective, and it is not well adapted for sick.

The three wards are intended to accommodate 14 beds, with from 649 to 730 cubic feet per bed.

The following table gives the details :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet per Bed. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 5 | 3 | 2 |
| 2 | 7 | 5 | 2 |
| 3 | 2 | 1 | 1 |
| Total - | 14 | 9 | 5 |

The wards are considerably over-crowded, and ought to contain no more than nine beds, and this would give little more than 1,000 cubic feet per bed.

There are no sufficient means of ventilation for the wards. To supply this deficiency we would propose to provide each ward with a shaft and inlet of the usual construction. In one of the wards there are two fire-places, one of which might be dispensed with, and built up. If this were done the disused chimney might be readily converted into a ventilating shaft by making an opening into it double its sectional area, close to the ceiling.

The wards are warmed by the ordinary barrack fire-grate, instead of which we would recommend our remodelled grates to be introduced.

The kitchen, which is under the same roof, and in the same line of buildings as the wards, requires ventilation through the roof. It is not sufficiently supplied with means of cooking, and requires an oven.

The surgery is very small and inconvenient, but this defect does not admit of remedy. It has no fire-place at which medicines could be prepared.

There is no pack store.

It has been stated to us that there is some probability of this barrack being given up, and we shall therefore confine our recommendations for the hospital solely to matters of absolute necessity.

*We would recommend :—*

1. That the wards be ventilated by shafts, inlets, and remodelled grates.

2. That the ventilation of the corridor be improved by louvres through the roof.

3. That the cesspit in the yard be abolished, the privy converted into water-closets, and drained. That the surface drainage of the yard be improved and connected with the barrack drainage.

4. That an oven be provided for the kitchen.

5. A small ablution and bath room to be provided.

Should it be eventually decided to retain this barrack, it would be necessary to extend the hospital, by adding a floor to it, or otherwise to supply the present deficiency in ward space and other accommodation.

JOHN SUTHERLAND.

## ISLE OF WIGHT.

SIR,

IN conformity with our instructions, we have inspected the Barracks and Hospitals at Parkhurst and Sandown, Isle of Wight, and have the honour to report on them as follows :—

### 1. PARKHURST BARRACK.

This barrack was constructed in 1796–97, and partakes more of the nature of a permanent camp than of a barrack, properly so called. It is situated in the open country, on the slope of a hill, within an enclosure 18A. 21P. in extent, about a mile from the river Medina, and together with the hospital ground and exercising ground it occupies a very considerable surface area.

The position is airy and healthy, with sufficient natural means of drainage if they be properly taken advantage of ; but the local climate is relaxing, and is said to be unfavourable to speedy convalescence. Although the subsoil is clay, the rapid fall of much of the ground keeps the surface dry. There is a large area, however, on the lower levels, as, for example, the 29-acre field in front of the hospital, which becomes swampy after rain, and hardly available for its object as an exercising ground during six months of the year on account of the want of subsoil drainage. A wide roadway extends from the entrance gate of the barrack directly up to the top of the slope. On the left-hand side of the roadway are situated the officers' quarters, accommodation for non-commissioned officers and for men, the mess establishment, main guard, cells, &c. On the right hand of the roadway are other lines of men's quarters, the cook-houses, ablution and bath rooms, water tanks, the old hospital, now used as married quarters, the privies, &c. Behind the buildings on the left hand of the roadway is a large sloping parade ground, enclosed by the barracks along one side, and having on the opposite side the provost establishment, stores, and a riding house, which has been converted partly into an excellent chapel school. At a short distance beyond these buildings, and still to the left, is the hospital.

The barrack-rooms consist of long wooden huts on brick foundations, erected across the slope, an unadvisable arrangement, on account of its interfering with the natural fall of the drainage, unless the water be caught and turned aside above each line. The outside walls of each hut are covered with thin tiles resembling sections of brick, imbedded in mortar, so that at first sight all the structures have the appearance of being built of brick. The inside walls are whitewashed. The rooms are a good height, and are carried up into the roofs, which are lined inside, and plastered. There is a porch outside the door of each room. A recess of it is lighted and ventilated by a window, and in this recess are placed the urine tubs, brooms, &c., during the day. Taken as a whole, these barrack-rooms have a light airy appearance and are more cheerful than most rooms of permanent barracks.

The total accommodation consists of 31 serjeants rooms and 89 barrack-rooms. Each serjeant's room accommodates one man. The men's rooms are of different sizes. They vary from 22 feet to 40 feet in length. They are from 20 feet to 27 feet wide. The lowest class of rooms have a height of 11 feet 6 inches, from which the height increases to 12, 14, and 16 feet. These heights include the part carried up into the roof. Half of the rooms have four windows each, and the remainder have three, five, and six windows, according to their size. Their cubic capacity varies from 5,566 feet up to 14,000 feet, and they accommodate from 12 to 24 men in each, with from 426 to 583 cubic feet per man. There is, however, only one room in which the men would be in possession of the larger of the latter amounts of space, but this room, although on the construction as a barrack-room, is occupied as a can-

teen. In 81 rooms the space per man varies from 426 to 489 cubic feet. The rooms are intended to accommodate 1,448 men. There were at the time the return was made up 16 twelve-men rooms and seven 16-men rooms occupied as married quarters. The following table gives the details of the accommodation :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Number of Men per Room at 600 Cubic Feet per Man. |
|---|---|---|---|---|---|
| 16 | 320 | 256 | 64 | 20 | 16 |
| 31 | 558 | 403 | 155 | 18 | 13 |
| 9 | 126 | 99 | 27 | 14 | 11 |
| 24 | 288 | 216 | 72 | 12 | 9 |
| 7 | 112 | 105 | 7 | 16 | 15 |
| 1 | 24 | 23 | 1 | 24 | 23 Canteen. |
| 1 | 20 | 16 | 4 | 20 | 16 |
| Total 89 | 1,448 | 1,118 | 330 | — | — |

This table shows that if all the rooms, including the canteen and married quarters, were occupied at 600 cubic per man, there would be space for 1,118 men. Deducting the rooms occupied as married quarters and canteen, there would be space for 846 men at 600 cubic feet per man.

Each barrack-room is ventilated by two shafts through the roof, and by a large open wasteful fireplace. The method is a very defective one, and causes incessant drafts in windy weather. The result is that the candles are blown about and wasted, and the men close up the ventilators. One shaft of sufficient sectional area would be enough for each room, and there should be, in addition, two inlets for fresh air, one on each of the opposite sides of the room, at the top of the window.

The fire-grate is placed in the division wall between the rooms. We would propose to substitute for it a remodelled fire-grate, to warm part of the air admitted in winter.

The barrack-rooms are lighted at night with candles. Gas is in use at Parkhurst Prison, which is only a short distance from the barrack, and we are informed that it would be easy to supply the whole barrack with gas from that source.

Two ablution-rooms have been provided for the whole barrack. They are at too great a distance from most of the rooms. They have slate tables, without beads, and there are basins, pegs, and gratings, and water is laid on from tanks.

A good bath-room, with seven slate baths, divisions, and gratings, was being constructed at the time we were there.

There is no laundry. The women's wash-houses are deficient in accommodation. There are two of them, having boilers, but no other convenience. They should have fixed tubs, with water laid on, gratings, ironing tables, and means of drying linen. They also require roof ventilation. The floors should be better flagged and drained.

There are four good cook-houses, with 13 boilers each, arranged round a central chimney. The boilers are of the old square pattern. There are louvres in the roof for ventilation. An oven for baking meat has been recently provided in each cook-house.

A great defect in this barrack is the condition of the drainage. The surface round the huts is in some places very roughly paved. The gutters are not well formed, and would be injurious rather than beneficial, were it not for the steepness of the slope down which they are carried. In some places urine and foul water were passing away on the surface. There are superficial drains, with large untrapped gulley grates opening into them. Two of these pass under buildings. There are altogether 70 sewers and drains connected with the barrack, about 30 of which only are trapped. They all discharge into two main drains at the lower end of the barracks.

There is no drainage for the privies. These conveniences are placed close to the boundary wall. They are of the usual ladder form, connected with cesspits outside the boundary, and very offensive. When the cesspits are emptied the unwholesome effluvia from them pervades the whole establishment. Before any steps can be taken to remove this nuisance, the entire drainage must be revised ; an outlet, if possible, obtained for the sewage ; obsolete drains filled up ; new lines laid down, and a thorough system of subsoil drainage carried out to drain the wet land. All gully grates must be renewed where necessary, and trapped. The main lines of drainage should be ventilated at the higher end of the slope, and at a sufficient distance from the barrack huts. A box of powdered charcoal placed at the mouth of the ventilator will do all that is required in the way of disinfecting the sewer air.

The privies should then be reconstructed as water latrines, on Macfarlane's principle ; they should have divisions of seats, half-doors, light and ventilation ; and all cesspits should be cleansed, filled up, and abolished.

A marked instance of the defective state of the drainage is afforded by the officers' quarters. These quarters are built in a small square. In the centre of the square are the privies, over cesspits, 12 feet deep, from which the ground is saturated with filth, and much nuisance occasioned. Sickness is stated to have arisen in the officers' quarters by this condition of the drainage. There is also an offensive ashpit in the same square. The whole should be removed ; the square opened up ; the cesspits abolished, and drained water-closets provided for the officers' quarters.

If a proper outlet for the privy drainage cannot be obtained, it should be disposed of as manure, in the same way as is done with Parkhurst Prison drainage, only greater care ought to be taken in applying it. The prison sewage is pumped up to a tank at the top of an elevation too close to the barracks, and allowed to flow over the surface, and in the immediate vicinity of the irrigation is a building which we were told is the parish fever hospital ; the whole procedure affording an excellent example of how a principle admirable in itself may be misused in its application.

If a suitable outlet cannot be obtained for the latrine sewage, we would recommend its being discharged once or twice a day into a water-tight cart, and removed for manure, as is done at Glasgow barracks.

Water is derived from three deep wells, and from two rain-water tanks. The supply is stated to be deficient in summer ; but new pumps are being constructed. The rain-water tanks, each of which contains 11,000 gallons, are supplied from the eaves spouts. Each deep well pump has a cast-iron tank to contain 347 gallons. There are besides two fire-engine tanks, each capable of containing 5,700 gallons of water, derived from the surface drains. The labour of 30 men is employed to raise the required amount of water from the pumps. The method of water supply is uncertain and complicated, while from the nature of the ground, the whole establishment, both barrack and hospital, could be supplied from one tank on the higher level of the ground. It is worthy of consideration whether a small steam engine might not be used for raising water to the height required for this purpose. We have frequently pointed out the great advantages accruing from a constant water supply for all sanitary purposes, such as drainage, latrines, baths, wash-houses, &c., over an irregular and intermittent supply obtained by hand labour, and the present case is one in which the change might be adopted with great advantage.

The urinals are partly of slate, partly of stone ; the latter are very imperfect in construction and drainage, and not supplied with water. Improved urinals are required.

The ashpits are also, of defective construction; they are large and deep, and expose too much surface. They ought to be contracted in size. The floors ought to be raised above the level of the ground, flagged, and drained to carry off the rain water.

As already mentioned, the non-commissioned officers are accommodated in 31 small rooms, made by dividing huts of the same construction as those used for men; they are unventilated, and require Arnott's valves in the chimneys, and remodelled grates, such as are used for non-commissioned officers' quarters.

There is a very good serjeants' mess, but it is also unventilated, and requires a shaft through the roof, with inlets under the eaves. The kitchen attached to this mess should have a better cooking range provided.

This is one of the very few barracks in which we have found a day-room in operation. The room is situated in a range of buildings near the library and chapel; it is well lighted; it is supplied with a billiard table, bagatelle table, and other games, periodicals, &c. It is managed by the men. There is a penny paid as entrance fee, and the subscription is 2*d.* per month. The admissions average about 2,000 per month. The strictest order and discipline are preserved by the management, and the results have been encouraging. The room is too small for the number of applicants for admission.

The room should be ventilated by a shaft, inlets, and a remodelled fire-grate, in the usual manner.

There is a library and reading-room adjoining this day-room, which should also be ventilated.

An excellent chapel, school, and lecture-room have been formed out of part of the old riding-school.

The unoccupied space of the riding school is used as a drill shed in wet weather.

In the same line of buildings is the provost establishment, consisting of 12 cells, in two stories, opening out of a corridor. The cells have each a capacity of 585 cubic feet, and are too small; otherwise they are good and admit of sufficient ventilation by sliding ventilators, which, however, are under the control of the prisoners. The latrines are connected with a cesspit, which ought to be abolished when the drainage of the barrack is improved. One unfavourable point in regard to these cells is, that being built on sloping ground, it is necessary to descend three steps to reach the corridor, so that the level of the ground outside is above the level of the floors of the cells.

There are five other cells used for temporary purposes, which are among the smallest we have anywhere met with. They are only 7 feet long, 6 feet 6 inches wide, and 7 feet high, affording only 315 cubic feet per prisoner. They are not fit to be used.

There are two guard-rooms, both in need of ventilation by a shaft through the roof and a remodelled grate.

The defaulters' room at one of these guard-rooms is very bad and not fit for its purpose; a new one should be provided.

The drainage of privies, &c., of these guard-rooms should be included in any general system of barrack drainage which may be adopted for the station.

*The following is a Summary of the Sanitary Improvements required for Albany Barrack:—*

1. Six hundred cubic feet to be allotted to each man in the barrack-rooms.

2. Barrack-rooms to have inlets for fresh air at the eaves, and remodelled fire-grates.

Non-commissioned officers' rooms to have Arnott's valves in the chimneys, and remodelled fire-grates. Serjeants' mess to be ventilated, and a better range provided for the mess kitchen.

Day-room to be ventilated by shafts, inlets, and a remodelled grate.

Reading-room and library to be similarly ventilated.

Guard-rooms to have shafts and remodelled grates.

3. Barrack to be lighted with gas.

4. Barrack drainage to be revised. The paving and surface gutters to be improved. Wet ground to be subsoil drained. Gulley grates to be trapped, and the sewers ventilated as suggested.

All privies to be reconstructed as water latrines, with divisions, half-doors, light, and ventilation, and their contents drained to an outlet, or removed in water-tight carts. Improved urinals to be constructed, and supplied with water.

Officers' privies and ashpits to be removed. The cesspits abolished, and water-closets, with drainage, to be provided.

5. Ashpits to be improved as suggested.

6. Women's wash-house to be improved and ventilated; also to be properly fitted up with fixed tubs, water, and a means of drying linen.

7. Beads to be provided for the ablution tables.

8. Water supply to be increased, and improved means of distribution provided.

While we make these recommendations for improving Parkhurst Barracks, it is incumbent on us at the same time to state, that from the temporary nature of the buildings, and from their mode of construction, they are very objectionable on two accounts. First, the very considerable extent of current repairs required, and, secondly, the nuisance from vermin in the woodwork. This last is a defect occurring in all wooden barracks after a time, and is much complained of in the present instance.

It is worthy of consideration whether the whole establishment might not be gradually renewed, and properly constructed brick huts substituted for the present wooden buildings. The decision of this question need not, however, interfere with carrying out the improvements we have advised for the present barracks.

*Hospital, Parkhurst.*

This hospital is situated on sloping ground at a short distance from the barrack, at the upper end of an undrained wet drill field, which after rain is sloppy and almost impassable. The building appears not to have been originally constructed for its present object. It consists of a central block, like an ordinary dwelling house, to which have been added two wings for the purpose of extending the accommodation.

The dwelling-house part has a passage from back to front of it, but the front lobby appears to be occasionally used to afford temporary accommodation of some sort, as it is cut off from the back part of the passage, which in reality forms the main entrance to the building. An ordinary wooden stair gives access to the different flats of the house. The original sitting-rooms and bed-rooms open out of it, a number of which are used for sick. Such an arrangement is under all circumstances an unsuitable one in a hospital, on account of difficulty in ventilating such wards; but in the present case, not only does this difficulty arise out of the original construction of the central part of the building, but the internal ventilation has been further deteriorated by building wings at each end, containing additional sick wards. The whole construction is very defective, and hardly fit for sick.

There are sunk basements under the building. One of these basements, situated under one of the wings, is fitted up and used as a sick ward, and, as might have been expected, cases at all serious do not recover in it, and have to be taken up stairs. This ward is totally unfit for occupation, and should be abandoned at once.

As a whole, the ward accommodation is of a defective character. There are altogether 15 wards, of which four are only 7 feet 6 inches high; they are in fact garrets. One ward is 8 feet 6 inches high, four wards are 8 feet 10 inches high, and six wards are 11 feet 4 inches high. It need hardly be stated that any of these heights are insufficient for sick wards. The six loftiest wards are intended for 16 beds each.

With regard to their other dimensions, the largest wards are 47 feet by 22; the smallest ward is about 15 feet square. The dimensions of the remaining wards, or rather bed-rooms, are those usually met with in country houses. The window space is very

deficient. No ward has above four windows. Three have two windows each, and there are seven wards with only one small window to each. The total accommodation is for 126 beds at from 404 to 794 cubic feet per bed. The following table shows the details:—

| Wards. | Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| No. 2 | 16 | 10 | 6 |
| „ 4 | 16 | 10 | 6 |
| „ 7 | 16 | 10 | 6 |
| „ 10 | 16 | 10 | 6 |
| „ 16 | 16 | 7 | 9 |
| „ 1 | 5 | 2 | 3 |
| „ 3 | 4 | 2 | 2 |
| „ 6 | 3 | 1 | 2 |
| „ 8 | 4 | 1 | 3 |
| „ 9 | 4 | 2 | 2 |
| „ 11 | 5 | 2 | 3 |
| „ 12 | 5 | 1 | 4 |
| „ 13 | 3 | 1 | 2 |
| „ 14 | 6 | 2 | 4 |
| „ 15 | 7 | 2 | 5 |
| Total - 15 | 126 | 63 | 63 |

The deficiency of accommodation in this hospital is 50 per cent. It is so large because there are a number of small rooms excessively overcrowded, while four of the rooms cannot safely be made to accommodate more than one bed each, although their cubic contents exceed 1,200 feet. The rooms are of such a size and construction as not to be suitable for more than one bed under any circumstances.

One of the wards for three sick persons is in an out range of buildings, formerly stables, and is a very unfit place for patients.

The ventilation of all the wards is very imperfect, and several of the worst wards are not ventilated. The plan which has been adopted in the others is that of openings close to the floor to admit air, and other openings close to the ceiling to allow air to escape. It will be necessary to close up all the lower openings. They admit cold air, which simply lowers the temperature of the ward round the beds, without beneficially affecting the state of the air. The upper openings should then be enlarged, to afford the requisite area per bed, and means to diffuse the air from them up towards the ceiling should be provided. The outlets should be of the usual form, namely, shafts carried from the corners of the wards above the roof.

Improved ventilating fire-grates for warming part of the air admitted during cold weather should also be introduced into the wards.

Besides ventilating the wards, it will be necessary to ventilate the stairs and passages by a louvred shaft carried from the top of the staircase, and by perforated frames in the windows.

The administrative parts of the hospital are not what they ought to be.

The hospital-serjeants' accommodation is in a damp unwholesome basement. The only accommodation for orderlies is one small unwholesome room, also in the basement, with a borrowed light, and only one bed. The ablution-room is in the same basement, and has no fixed basins. There are no baths, except the ordinary slipper bath. The wash-house is an outbuilding without fittings except boilers, and it has no ventilation. The hospital guard-room, which is in a range of buildings behind, is small and very bad. The stores are in the same buildings. These buildings were formerly stables. They are large enough, but otherwise not good. There is a dead-house at the end, without any suitable means of making *post mortem* examinations. It requires drainage, water, and a table.

The kitchen is in the centre basement of the hospital, and has no ventilation. It has a good and sufficient cooking range. The provision store belonging to the kitchen is very bad.

Water is derived from a well 375 feet deep, situated in the square behind the hospital. It is supplied to the buildings from tanks. Four water-closets, said to be continually out of repair, have been recently erected in a projection behind the staircase. They are not well placed, and obstruct the outer ventilation of that side of the hospital.

In the proper acceptation of the term, there is no drainage. All matter discharged from privies and water-closets is conducted into cesspits in the hospital yard, close to the well. One of these cesspits under the hospital windows is 35 feet deep. Another cesspit near the privies appeared to be full, as cesspool matter was oozing out of the ground and lying on the surface. A result of this state of the drainage is that offensive smells are complained of about the hospital.

On account of the general closeness and dampness of the air within the building the hospital is said to swarm with bugs.

Enough has been said to show that this building requires an entire revision. The air needs purifying both without and within it. *With this view we would recommend*:—

1. The large extent of wet sloppy ground about it to be underdrained.

2. The hospital itself to be sewered to an outlet, or if this be impossible to a sewage tank at a sufficient distance, from which the sewage can be run into carts and removed.

3. All cesspits to be cleaned out, filled up with fresh earth, and abolished.

4. All sick to be removed out of the basement, and the accommodation to be struck off the ward construction.

5. The number of beds per ward in the remaining wards to be reduced to the extent shown in the table, in order to give as near as may be 1,200 cubic feet per bed.

6. Ventilating shafts to be provided for all the wards. Present inlets near the floor to be permanently closed. Inlets at the ceiling to be enlarged, and improved so as to diffuse the air, or additional inlets in the outer walls close to the ceilings to be provided. Inlets to be provided for those wards in which there are none at present. Ventilating fire-grates to be introduced in the wards.

7. Stairs and passages to be ventilated by a shaft through the roof and perforated glass panes in the windows.

8. Kitchen to be ventilated, and to have a better provision store.

9. Better quarters to be provided for hospital serjeant and orderlies.

10. All the privies in the outbuildings to be reconstructed as water latrines, with drainage.

11. A bath-room (not in the basement) to be provided, with two baths, and hot and cold water laid on, and a proper ablution table with sunk basins.

12. Hospital guard-room to be improved, and ventilated by a shaft and remodelled grate.

13. Hospital to be thoroughly cleansed; the walls scraped and lime-washed. Useless partitions to be removed, especially in the basement, to enable the air to circulate.

14. A plan to be prepared for extending and improving the accommodation to meet the requirements of the station.

15. Dead-house to be improved as suggested.

Lastly, there being no accommodation for the sick wives or children of soldiers, the subject might be considered while reviewing the hospital plans, with the view of affording the required accommodation, either in the extended buildings, or in a special hospital hut near the married quarters in the barracks.

### 2. Sandown Barrack.

This barrack is situated in the open country above Sandown village, overlooking the bay. The situation is high, open, airy, and healthy, and has abundant natural facilities for drainage.

The barrack buildings consist of a centre block two stories high, and two side ranges, each one story high, projecting at right angles from the central block, but detached from it. One of these ranges is appropriated as officers' quarters. The other range contains quarters for men. It was originally an artillery barrack, the centre block having been set apart for men's quarters. The present officers' wing were the gun sheds, and the men's range opposite were stables. The establishment was next occupied by the coast guard, under whom it was arranged as at present. Like all other similar conversions of buildings, whatever may have been their original advantages, there is no doubt that in their present shape these ranges make bad quarters either for officers or men.

Behind the centre there is a one-story range of buildings, containing the cook-house, ablution-room, wash-house, and also the hospital accommodation, such as it is.

The centre range consists of separate houses, having each a passage and stair giving access to rooms for serjeants and for men. Some of the rooms are larger and better than others. Some have windows on opposite sides, while others have windows only on one side.

The rooms, 24 in number, are far from being uniform in size. They vary in length from less than 12 feet up to 34 feet. There are only two rooms with as great a breadth as 21 feet, the remaining rooms being of very various breadth; some as narrow as 8 feet. They vary in height from 9 to 10 and 11 feet. The average allowance of space per man is somewhat more than that usually given in small barracks. It varies from 310 to about 450. In two or three small rooms with two beds each the space is over 600 cubic feet.

The following table gives the accommodation in different classes of rooms:—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 10 | 6 | 4 |
| 1 | 8 | 5 | 3 |
| 1 | 18 | 13 | 5 |
| 1 | 18 | 12 | 6 |
| 1 | 12 | 7 | 5 |
| 1 | 18 | 12 | 6 |
| 5 Two-men rooms | 10 | 10 | — |
| 1 Three-men rooms | 3 | 2 | 1 |
| 14 Four-men rooms | 56 | 37 | 19 |
| 26 Total - | 153 | 104 | 49 |

The rooms have an excess of 49 beds over their approximate accommodation at 600 cubic feet each. The smaller rooms generally are hardly fit for barrack-rooms. As to comfort, they are only sufficient for single beds. An approximation to 600 cubic feet can be obtained by removing one bed out of each of them. But perhaps the best thing to do would be to revise the construction, and to rebuild this part of the barrack. The group of small rooms in the detached one-story building opposite the officers' quarters are very bad, and should be replaced by better accommodation.

None of the rooms are ventilated, and all require the usual improvements of shafts, inlets, and remodelled grates.

The serjeants' rooms require Arnott's ventilators.

There is neither day-room nor school-room. A small five-men room is set apart as a reading-room. These is no cleaning-room and no workshops.

There is a small, narrow ablution-room, without light except by the door. It has no gratings and no water supply. There is a slate bath, but as there is no water laid on the men seldom use it, on account of the labour required in carrying water to fill it. Before a man can bathe he has to pump and carry 20 buckets of water, which is an effectual bar to the use of this means of personal cleanliness.

These arrangements require to be revised. There is a cook-house, with four boilers, and a baking-oven recently constructed. The building requires a louvre in the roof for ventilation.

The water supply is derived from a well, but is so insufficient that 208 gallons of water per diem have to be purchased for the use of the troops when the barracks are occupied. There is a small rain-water tank.

The drainage is bad and insufficient. Such drains as there are are not trapped. The whole arrangement of surface draining and sewering requires to be revised, and a proper system laid down.

The privies are of the usual barrack form, connected with cesspits, and very offensive. They require to be drained, and reconstructed as water latrines on Macfarlane's principle, with the usual arrangement of seats, divisions, and half-doors, light and ventilation.

There is a large deep ashpit which receives surface drainage. It should be filled up; the surface raised above the level of the ground; paved and drained. The size should also be very much reduced.

The women's wash-house has no water and no conveniences.

There is a small guard-room and lock-up, both of which are very bad.

There are no married quarters, no non-commissioned officers' mess-room, and the storage is deficient. The buildings are said to require constant repairs. The barrack square has no proper enclosure.

Enough has been said to show how imperfect a barrack this is. The whole of it should be revised, if it is to be occupied; defective parts reconstructed, and deficiencies supplied.

*The Sanitary Improvements required are as follow:—*

1. To give 600 cubic feet per bed in the barrack-rooms.

2. To ventilate every room by shafts, inlets, and remodelled grates. The guard-room also to be ventilated.

3. Improved water supply to be provided and laid over the barracks.

4. Barrack to be drained to an outlet. Surface drainage and paving to be relaid. All drains to be trapped.

5. Ablution-room to be lighted, ventilated, and supplied with water. Gratings to be provided. Water to be laid on to the bath. Bath-room to be divided off from the ablution-room.

6. Cook-house to be ventilated.

7. Privies to be drained, supplied with water, and reconstructed as water latrines, with divisions and half-doors, and the building to be properly ventilated and lighted. Ashpit to be improved in the manner pointed out.

8. Women's wash-house to have the means of washing and drying linen.

### *Sandown Hospital.*

As already stated, the hospital is situated behind the centre block of the barrack, at the end of a one-story range of buildings containing the cook-house, &c.

It consists of two wards, one of which is 18 feet 9 inches long, 15 feet wide, and 10 feet high. The

other is 11 feet long, 10 feet 9 inches broad, and 10 feet high. The accommodation is as follows :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Space. |
|---|---|---|---|
| 1 | 5 | 2 | 3 |
| 1 | 3 | 1 | 2 |
| 2 | 8 | 3 | 5 |

So far as space is concerned, these rooms would hold three beds instead of eight, but that is all that can be said about them. In other respects they are quite unfit for sick, except merely as affording space for a sick man until he can be removed. The rest of the establishment consists of a small orderly's room, and a small place for medicines. There is no water-closet, and sick men have to walk across a potato garden to a privy over a cesspit. There is no kitchen, bath, or ablution-room. The surface drainage is so defective that foul water was lying opposite the hospital door and windows when we were there. There is no ventilation, and no water supply except from the pump or from purchased water.

The medical officer who made the return to us regarding this place says, "strictly speaking, there "may be said to be no hospital at Sandown, and "when there are cases that require hospital comforts "I have always recommended that they be sent to "the General Hospital at Parkhurst." This, no doubt, is the wisest course, although, as we have already shown, Parkhurst hospital requires great improvement to make it fit for sick. In the proper sense of the term, there is no good hospital accommodation in the Isle of Wight at present.

The only thing that can be done with the Sandown wards is to ventilate them, and to improve their drainage and water supply, together with those of the barrack.

If the barrack is to be used by soldiers, there should certainly be proper hospital accommodation attached to it.

JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

*July*, 1860.

## CHICHESTER BARRACKS.

SIR,

WE have the honour to lay before you the following interim report on the sanitary condition of the cavalry and infantry barracks, Chichester.

These barracks are situated in the open country, about a mile to the north of Chichester, in an open, airy, healthy district. They are enclosed within an irregularly shaped area of ground, 22A. 2R. 15P. in extent. The subsoil on which they stand is shingle mixed with clay. It is only partially self-draining. In dry weather water is found at ten or twelve feet below the ground, but it sometimes rises to within two or three feet of the surface, and as a whole the ground is not sufficiently porous to absorb heavy rains quickly, and the water usually lies on the surface for some time after rain. This defect could be remedied by subsoil drainage.

The barracks consist of detached huts of wood resting on brick foundations.

Those of the cavalry are situated at the south end of the enclosure, and are built in a long row, divided into separate barrack-rooms by brick partitions containing the fireplaces. The cavalry stables are similarly constructed. The infantry huts are single and detached. All the huts are roofed with slates or tiles.

The infantry huts are 33 in number, and are all built on the same model. They are 30 feet long, 16 feet broad, and 10 feet high, and are intended to contain 14 men each, with 343 cubic feet per man. They have all plastered ceilings, and are lined inside with wood.

The rooms in the cavalry range are 25 feet square and 12 feet high, and contain 13 men each, with 574 cubic feet per man. One room for six men gives 725 cubic feet per man.

Each infantry hut has four windows, two on either opposite side. They are partly swing windows and partly sliding windows. Between two of the windows on one side is the entrance door, protected by a porch with a window in it; and opposite the door between two other windows is the fireplace, which is of brick, with a brick chimney. Between the fireplace and the door are the men's table and forms, which occupy nearly the whole of the space left by the beds. In these huts the superficial area is not turned to so good an account as it is in the more recent model huts, on account of the beds being arranged along the four walls. There are five beds at each end, and two beds at each side, and when they are let down nearly the whole surface of the floor is occupied, and the huts have the appearance of being very much crowded.

It would add to the men's comfort, as well as to the healthiness of the huts, to remove the four beds at the sides, leaving the end beds as they are. This would give 480 cubic feet per man for the remaining ten men. We have more than once stated that it is not necessary in barracks consisting of small detached wooden huts to give the same amount of cubic space which is required in large masonry barracks; and taking all the circumstances of the present case into consideration, we are of opinion these huts would not be overcrowded with ten men in each. We do not propose to make any alterations in the regulation numbers in the cavalry huts.

The following table will show the effect of these reductions on the total accommodation :—

| — | Rooms. | Present Regulation Accommodation. | Proposed Numbers. | Deficiency of Accommodation in Men. |
|---|---|---|---|---|
| Infantry - | 33 | 462 | 330 | 132 |
| Cavalry - | 8 | 104 | 104 | — |
| „ - | 1 | 6 | 6 | — |
| Total - | 42 | 572 | 440 | 132 |

There is abundance of ground on which to erect huts for the displaced men, and for a large number of men besides, were it considered necessary to do so.

Some provision has been made for ventilating the huts by small apertures through the ceiling into the space between the ceiling and roof. We do not consider this as sufficient, and would advise that a ventilating shaft be carried from the centre of the ceiling through the ridge. We would propose to admit fresh air by a flue in the chimney, so arranged as that the air admitted should be partially warmed and thrown into the room near the ceiling by louvres arranged to send the current towards the ceiling.

There is a very good non-commissioned officers' mess-room. It is not sufficiently ventilated, and ought to have a silk flap ventilator into the chimney, and an inlet for air.

Candles are used for lighting the men's rooms. There is gas in Chichester, which is laid on to no great distance from the barracks. If the company's mains should be at any time laid down sufficiently near the barrack, we would advise gas being introduced throughout.

There is a brick building at one end of the enclosure, containing a good school-room, which has recently

been converted into a chapel school. It is sufficient, though not so expensively built as are the chapel schools belonging to permanent barracks. It requires louvres in the ridge for ventilation.

There is an infant school in a hut. It should be ventilated by a shaft and inlet, as recommended for the men's huts.

There is a library and librarian's quarters situated in a hut building. The library is very small, and should either be enlarged, or a day-room, to which the men could resort, should be provided. The librarian's quarter is good. A louvre should be placed in the roof of the library to afford the necessary ventilation.

Two huts are set apart as ablution-rooms for the men. They have water tanks and force pumps, and water is laid on to the ablution benches. The benches are of slate, but have no bead round the edge, as they ought to have. There are a few pegs over the basins, but there are no gratings for the feet, and the floors are not sufficiently sloped to secure rapid surface drainage. The rooms are hardly sufficiently lighted, and they have no ventilation. They should each have a ventilating skylight in the roof, and they should have more pegs and gratings. The tables should also have a bead put on them, sufficient to prevent the water dashing over on the men while washing.

Each ablution house has a common small slipper bath under the water tank. It is quite inadequate to the wants of the barrack, especially as regards its present occupation by a depôt battalion. Recruits are constantly arriving at the depôt in a condition requiring abundant means of cleanliness. For this purpose we would recommend that fixed baths with water laid on should be provided, in the proportion of one bath to every 100 men.

There is no proper laundry. The women's wash-house has fixed washing tubs, but water is not laid on, and there are no means of drying or getting up linen. These deficiences should be supplied, and the wash-house should be ventilated through the roof.

There are two cook-houses, one containing 15, the other 7 boilers, many of which are of the old pattern and require resetting.

There are no ovens, but we were informed that they were about to be provided. It would improve these cook-houses very much to give them additional light by a skylight through the roof.

The entire water supply of the barracks is derived from wells, and in such a soil it ought to be sufficient for all purposes, at least so far as the amount of it is concerned. But the quality of water derived from porous ground depends very much on the state of the drainage. If the surface drainage or cleansing be deficient, so that impurities are washed into the subsoil, all the wells are liable to become more or less tainted and unwholesome. The condition of the drainage becomes therefore in this, as in many similar instances, an important element in the question of water supply, quite apart from any malaria or atmospheric impurity that may proceed from defects in the drainage itself.

These barracks are most imperfectly drained. There is nothing but superficial surface drainage in all stages of imperfection. At the lower end of the enclosure among the cavalry barrack buildings, the whole sewage lies in gutters formed of rough cobble stones, with a deficient fall. Among the infantry huts the surface gutters are formed partly of carefully laid brick, and are of better construction. In other gutters the bottoms are rough, and foul water and mud lies in them close to the huts. There is a deep trench running along the front of the entire range of officers' quarters and huts in which foul water was lying stagnant to some depth. Into these gutters and trenches is turned the waste water from ablution houses, wash-houses, cook-houses, &c., no inconsiderable part of which must find its way into the subsoil; besides which none of the privies are drained, but are all placed over cesspits periodically emptied, and in the meantime their fluid contents escape into the ground.

Close to the cavalry barracks is a dungpit, in which foul water was lying at the time we were there, and at the opposite end of the barrack enclosure is a shallow gravel pit containing a quantity of green putrid water, which had no doubt percolated into it from the subsoil. The surface drainage, such as it is, escapes under the boundary wall by two outlets; one on the east, the other on the south side. The former outlet appears to end in a ditch; the drainage by the latter outlet passes into a ditch in a field immediately outside the barrack boundary, and thence into a pool of water close to the hedge beside the public highway. From thence it crosses the road into another pool, and appears to escape finally into the town sewers. The whole arrangement is as defective as it can well be, and requires a thorough reconstruction. The extent to which the present system is likely to injure the water supply may be judged of by the fact that the percolation from the officer's privy has so saturated the subsoil that the well for the supply of the mess kitchen contains the most indubitable evidence of the presence of cesspool matter in it.

It appears to us to be indispensably necessary to proceed at once to improve the drainage of the barracks, and the first thing is to find an outlet. In doing this, we would recommend an inquiry to be made as to whether the barrack drainage could be passed into the town sewers. If so, and if access can be had to them within a reasonable distance, a sufficient outlet will be at once obtained.

If this cannot be done, we would advise the existing outlet to be used under the following conditions, namely, that a cesspit and filter bed should be constructed in the field outside the barrack boundary, on the site of the pool, and that all the barrack drainage, including that from the latrines, should be led into it and filtered, the fluid being allowed to escape as at present, and the solid part being removed at intervals as manure.

If, again, this were objected to, it would be necessary to provide for the daily removal of the urinal and privy drainage by a water-tight cart, and to apply it to land as manure.

In one or other of these methods the whole privy drainage which now saturates the subsoil ought to be got rid of; and if the privy drainage must be dealt with separately, the other drainage might be conducted in drain pipes to its present outlet.

The parade ground should be drained by pipe-tiles laid at least four feet below the surface, and the water conveyed to the same outlet.

As soon as a drainage outlet is provided, all the privies should be reconstructed as water latrines, with divisions of seats, half-doors, and sufficient light and ventilation. All cesspits within the barrack boundary should at the same time be abolished. While these improvements are being carried out, properly constructed urinals, supplied with water for cleansing, should also be provided. One such urinal should be placed near the officers' mess room.

There are several ash-pits in different parts of the enclosure. They are dug out of the ground, and are open to the objection of tending to affect injuriously the purity of the water supply. They should be filled up to the level, and paved and drained. Were this done, they might be used without danger, on account of the open airy situation of the barrack.

Close to the entrance gate of the barrack there is a guard-room and six cells, three are attached to the guard-room and three are in an adjacent range of buildings. Like the remainder of the barracks, both guard-room and cells are of wood. They are not good, and the cubic space they afford is very limited. It is only 328 cubic feet per cell. The guard-room itself gives 316 cubic feet per man to 12 men. There is besides a small lock-up room, intended for 6 men, at 292 cubic feet per man. The guard-room is low in the roof, and has a large circular opening in the ceiling, with a louvre over it for ventilation, but the

room was very close notwithstanding. In this instance it would be well to try the effect of the arrangement in Muir's four-pointed ventilator described in the printed paper of instructions. It is possible that the ventilating power of the louvre might be increased by it. With regard to the cells, we would advise that a larger extent of inlet for air be provided near the stove. A small foul air shaft, with a sectional area of about 8 square inches, should also be carried from the ceiling of each cell to above the roof.

The paymaster's office is at present used as a tailor's shop. It should have a silk flap ventilator into the chimney, and an inlet for air.

The canteen tap-room requires a silk flap ventilator in the chimney, and perforated glass panes in the upper window sashes.

These barracks have no day-room nor drill shed. Accommodation for 36 married soldiers and their families is provided by appropriating nine huts, and dividing each hut into four compartments by partitions. There are also nine rooms for 12 colour-serjeants. No married people sleep in soldiers' rooms.

*The following are the Sanitary Improvements required for Chichester Barracks* :—

1. Reduction of number of men in each infantry hut from 14 to 10.

2. Ventilation of each hut by a shaft and inlet for admitting warmed air, as described. Ventilation of the non-commissioned officers' mess-room and of the tailor's shop by silk flap ventilators and inlets as described. Ventilation of the chapel school through the ridge. Ventilation of the library and infant school by shafts through the roof. Guard-room ventilation to be improved as described. Cells to be ventilated by shafts.

3. Drainage of the floors of the ablution-rooms to be improved by increasing the slope. Gratings and additional pegs to be provided. A bead to be put on the ablution table. A large ventilating skylight to be put in the roof of each ablution house. Fixed baths, with water laid on, to be provided in the proportion of one bath to every 100 men.

4. Women's wash-house to be ventilated through the roof. Water to be laid on to the tubs. A drying and laundry stove and means of ironing linen to be provided.

5. Cookhouses to have each a roasting oven, and a skylight in the roof.

6. The whole barrack area to be under drained, as described, to an outlet obtained in one of the ways suggested. Cesspits to be abolished, and the privies to be converted into water latrines, with divisions of seats, half-doors, light, and ventilation. Urinals supplied with water, to be constructed where required. Dungpit and ash-pits to be filled up to the level, and to be paved and drained.

*Chichester Barrack Hospital.*

This hospital is situated in a prolongation of the barrack area, at its south-eastern corner, and it overlooks the field where the open pool is situated, into which the barrack drainage is received.

It is a large one story wooden building, lined with wood inside, and covered with tiles. It consists of a centre, with two wings projecting behind the line of the main building. Each of these wings contains a long ward, and there are two similar wards in the main building. The wards are entered by a long inside passage running from end to end of the centre part and lighted from the ends. Another passage crosses the central passage at right angles in the middle of the building, to afford access to the kitchens, which are situated behind the hospital.

The surgery, stores, serjeants' room, &c., are situated at the back of the central passage. At the end of the long central passage are spaces cut off for stores by a partition and door. The position is not a good one, for they have a common ventilation with the wards and passage.

There are two orderlies' rooms on the construction, but one of them is used as a provision store, and the other is used as a small ward, so that the very objectionable practice exists in this hospital of one orderly sleeping in each ward among the sick ; a practice which is quite unnecessary, and which ought to be discontinued at once, by restoring the orderlies' rooms to their original design. Better that there be no provision store and no small ward, than that orderlies sleep among the sick.

Although this is a depôt hospital, there is no waiting room for the inspection of recruits.

The following table shows the ward accommodation :—

| Wards. | Present Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| 4 | 64 | 40 | 24 |

Each ward can accommodate about 10 sick, 40 in all, giving about 1,100 cubic feet per bed. This amount of space can be at once obtained by distributing the beds, the present sick not exceeding 4 per cent. of the force ; and two large wards are now empty.

Each ward has four windows, three along the side and one at the end ; some open at top, some only at the bottom.

There are openings in the ceilings of the wards into the space between the ceiling and roof. They are intended for ventilation, but they are not enough, as the hospital is said to smell offensively when shut up.

We would propose to ventilate these wards by one louvred shaft through the ridge over the centre of the ward, which shaft should be connected with each of the openings in the ceiling, and these openings should be enlarged to afford a sufficient area of outlet. The central passage should be ventilated by two similar shafts, one on each side the central entrance, carried up midway between the central entrance and the end of the passage. Additional means of thorough ventilation should also be provided by making all windows to open at top.

A considerable amount of air at present enters the wards through the boarding, but it would be well to provide two inlets near the ceiling, to be covered with perforated zinc cornices, and to have the means of closing, if necessary. The grates should also be remodelled to warm a part of the admitted air.

One source of the bad smell in the building is that there is no ventilation beneath the floors, which are laid on the bare ground. Part of the flooring in one of the wards is decayed in consequence. We are of opinion that openings should be made in sufficient number in the brick foundations to allow the air to pass under the flooring. Part of the roof water is carried off by gutters, but a large part of it falls close to the hospital walls and soaks into the ground. The roof guttering should be carried round the building.

Candles are used for lighting. If gas be introduced into the barrack, it should also be conducted into the hospital.

There is an ablution-room in the yard behind the hospital, with a brick floor, fireplace, and boiler, a bench, basins, and pegs, but there are no gratings for the sick to stand on while washing. There are two slipper baths and one hip bath, but there is no fixed bath, and the room must be reached by walking across the yard in all weathers. It is not such a place as sick should be sent to wash in, for ablution and bath rooms should always be connected directly with the wards. In default of this, in the present case we would advise a fixed bath, with hot and cold water laid on, to be provided in the present room ; and that, if practicable, a covered communication be formed between the hospital and the ablution-room

for protecting the sick in going from the one to the other.

Next the ablution-room is an excellent kitchen, well supplied with the means of cooking hospital diets. It has a Flavell's cooking range, which is stated to answer very well in this case, although reported against in others.

Adjoining the kitchen are the pack store and dead house. The former is good and sufficient, but it has no stove for keeping the air dry. This deficiency ought to be supplied.

The hospital drainage is of the same character as the barrack drainage. It is altogether defective. Some of the gutters close to the wards had foul water lying in them, and between the outbuildings and the boundary wall there is an open sewer or drain with foul water and mud in it.

There are no water-closets, but only privies over cesspits in the backyard, within a few yards of the pump which supplies the hospital with water. Improvements ought to be carried out in the drainage at the time the barrack drainage is reconstructed. The cesspits ought to be filled up, and drained water latrines substituted for the privies. A covered communication should also be made between them and the wards.

There is no accommodation for the sick of soldiers' families.

*We would recommend the following Sanitary Improvements to be carried out in this Hospital:—*

1. The sick to be more equally distributed in the four wards, to give as near as may be 1,200 cubic feet per bed.

2. Each ward to be ventilated by a louvred shaft carried up from the ceiling, as described, and by two inlets for air. Passage to be ventilated by two shafts from the ceiling. Ventilation to be introduced beneath the floors. All windows to be made to open at top. Grates to be remodelled to warm part of the admitted air.

3. A fixed bath, with hot and cold water laid on, to be provided in the ablution-room. Gratings for the feet to be provided. Ablution-room to be connected, if possible, by a covered communication with the hospital.

4. The whole hospital drainage to be improved, together with the barrack drainage, and carried to the same outlet. Roof guttering to be put round the whole hospital. Cesspits to be abolished, and the privies to be reconstructed as water latrines, and connected with the hospital by a covered passage.

## BRIGHTON BARRACKS.

SIR,

We have the honour to transmit the following report of our inspection and inquiry into the sanitary condition of the Brighton barracks.

These barracks are two in number, one for cavalry, situated at a short distance to the north-east of the town; the other for infantry close to the Pavilion. Both barracks are now occupied by cavalry, and the horses belonging to the men in the infantry barracks are kept in the stables of the Pavilion. The cavalry barrack is in the country, and occupies a not unhealthy site, but the infantry barrack is in an unhealthy locality, within the town.

The amount of sickness among the troops in occupation has been very considerable. We learn from a return made to us by the medical officer of the 6th Dragoon Guards, that between the 1st May 1855 and December 1st, 1857, a period of two years and seven months, out of a strength of 464 men there were 1,641 admissions to hospital, so that a number equal to the entire force must have passed through hospital nearly every eight months during the period. The total deaths during this period were 13, of which nine arose from fever, cholera and diarrhœa. The facts go to show that, making allowance for other causes of disease unconnected with the buildings, there must be some serious sanitary defects in one or other or in both barracks, and what these are we shall presently show.

### 1. THE CAVALRY BARRACK.

This barrack is situated on the left-hand side of the road from Brighton to Lewes, close to the Brighton water-works, and immediately outside the borough boundary. It lies in a valley, with a lofty embankment of the Lewes and Brighton railway rising immediately behind its boundary wall. The subsoil is chalk, and the area within the barrack enclosure is 11A. OR. 2P.

The ground is in form a parallelogram extending along the road, and there is a gentle slope of the ground towards the road.

The barrack buildings are placed the lengthway of the enclosure, and consist of three blocks in line, running from N.E. to S.W., the front facing the S.E. The hospital, which stands in the same enclosure with the cavalry barrack, serves for both cavalry and infantry barracks.

At the S.W. end are officers' quarters. At the N.E. end are the riding school and stables with soldiers' rooms over them, and between the blocks are the forage stores.

Behind the blocks, and built along the back boundary wall, are the cook-house, wash-house, ablution-room, privies, dung-pits, &c. At the N.E. extremity of the enclosure is placed the hospital, and along the N.E. boundary wall there is a range of temporary one-story buildings used for workshops, library, school-room, &c. All the permanent buildings are of brick, and are old.

Some of the men's rooms are in attics over the riding school and officers' quarters, but the majority are placed over the stables, and consist of one story and an attic.

Like the rooms in most other cavalry barracks, they are arranged on two sides of a long central corridor extending from end to end of the block, and are reached by two inside stairs of stone in the length of the block, and an outside stair at one end.

The corridor is about 200 feet long and about four feet in width, and has a window at one end, and a glazed door at the other. A little light is admitted at the point where the staircases open on the corridor, but otherwise it is simply a long dark passage, depending for what little light it has mainly on the casual opening of the barrack-room doors.

This corridor is as imperfectly ventilated as it is imperfectly lighted. The only escape for foul air from it is by the stairs leading to the attics, which are used as men's rooms, and were partly so occupied at the time we were there.

Out of the corridor there open 10 serjeants' rooms and 20 troop-rooms. The latter are all of the same size, namely, 27 feet 6 inches long by 17 feet broad, and 8 feet 3 inches high. They have each two windows on one side, with a small sliding window over the door, or in the partition dividing the room from the corridor. The windows are not placed equally in the length of the room, but are at the end opposite the door, and there is space for a third window in the wall, occupied at present by a blank window, which might be opened with great advantage to the healthiness of the rooms. The rooms are not so comfortable as they would have been if, instead of placing the door close to the fire, it had been put at the opposite end of the room. Such an arrangement would have improved both the ventilation and warming.

Over the troop-rooms are seven attics; there are two attics over the riding-school, and two over the

officers' quarters. They are open to the roof, but have a plastered ceiling inside the rafters.

These attic rooms extend nearly across the building, and are lighted by dormer windows in the roof.

The total accommodation afforded by the different classes of rooms is for 422 non-commissioned officers and men, the details of which, as regards the men's rooms, are given in the following table :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 20 Troop - - - | 180 | 140 | 40 |
| Attic D. 1. - - - | 16 | 14 | 2 |
| „ „ Stair - - | 26 | 18 | 8 |
| „ E. 1. - - - | 24 | 18 | 6 |
| „ „ Stair - - | 14 | 12 | 2 |
| „ „ 2. - - - | 24 | 20 | 4 |
| „ F. 1. - - - | 20 | 15 | 5 |
| „ „ Stair - - | 26 | 20 | 6 |
| Over Riding School : | | | |
| 1. - - - | 22 | 18 | 4 |
| 2. - - - | 28 | 20 | 8 |
| Over Officers' Quarters : | | | |
| 1. - - | 10 | 9 | 1 |
| 2. - - | 12 | 10 | 2 |
| Total - - - | 402 | 314 | 88 |

Each of the 20 troop-rooms in this table has regulation accommodation for nine men in a space where no more than seven men ought to be, and in order to approach 600 cubic feet per man, two men should be removed out of each troop-room. The excess of numbers in each attic is shown by itself. It appears, therefore, that the cubic space in these barrack-rooms will not accommodate more than 314 men, and to do this, it is necessary in every case to give less than 600 feet per man, by leaving a man in the room instead of removing him, as none of the rooms will divide into spaces of 600 cubic feet without leaving a balance, which we have counted as one man's space.

The attic rooms are far from being healthy, and most of the cases of small-pox, a disease which has recently prevailed in the buildings, have come from these rooms.

Each of the troop-rooms has a perforated plate in the ceiling, close to the chimney, which is stated to open into a shaft carried up into the ridge of the attic. This is intended for ventilation, but it is of little or no use. We would propose to deal with the ventilation of the building as a whole, and in doing so the first thing is to provide that the corridor be properly lighted and ventilated.

To effect this we would propose that two square shafts be carried up from the ceiling of the corridor, through the attic to the ridge of the buildings. They should be placed at as nearly as may be equal distances from the opposite ends of the corridor, and from each other, having respect at the same time to the position of the stairs, which, as already stated, afford a certain amount of light. The shafts should, in short, be carried up in the darkest parts of the corridor. Their breadth should be the same as the breadth of the corridor. They should be carried straight up through the ridge, and covered with a properly ventilated skylight, and they should be plastered inside.

While this is done perforated glass panes ought to be placed in the window and door at the opposite extremities of the corridor, and also into all the stair windows.

Every troop-room ought to be ventilated separately. The covers should be removed from the ventilators in the ceiling, and in every instance where these ventilators are connected with a shaft, the shaft should be carried above the roof, to afford an independent outlet for the foul air of every barrack-room. In rooms where there are no shafts a shaft should be carried from the ceiling to above the roof. Each room should also have an inlet for fresh air inserted close to the ceiling of the outer wall at the end of the room farthest from the air shaft. It should be covered within the room with a perforated zinc cornice for diffusing the air.

The attics should be ventilated by a louvred ventilating turret, carried up through the ridge of each room. Each non-commissioned officer's room having a shaft should have it prolonged above the roof, and where there is no shaft the room should be ventilated by a silk flap ventilator into the chimney.

All the barrack-rooms are warmed by the old pattern grate, and a large amount of fuel is wasted in consequence. A remodelled grate with warm air admitted should be introduced instead of the present one.

In order to prevent, as far as practicable, the fumes from the stables entering the barrack-rooms, we would recommend that a shaft a foot square be carried up from each corner of the stable to above the roof. These shafts should be carefully lined with soldered zinc, to prevent any escape into the barrack-rooms. The stable windows should be enlarged to give more light.

We may mention, as influencing the purity of the air in the men's rooms, that the drainage and paving of the stables is complained of as being very defective, leading to a filthy state of the surface, and that there are no litter sheds, so that the litter is spread out to dry immediately under the barrack-room windows. Sheds should be provided at a short distance from the building, leaving a passage for air between.

The barrack-rooms are lighted with candles, instead of which we would recommend a ventilated gas-burner to be introduced into each room.

There is a small school-room, used both for adults and infants. It is in the one-story buildings, at the northern end of the barrack square. It is not ventilated, and its warming is defective. To improve both we would recommend that a shaft be carried through the ceiling and roof, and a small Cundy's stove put up, by which part of the air admitted for ventilation can be warmed.

A part of the school-room has been partitioned off as a library, but it is very small, and only sufficient to keep the books under lock and key. There is no room for reading except the school-room.

A long building close to the back boundary wall, near one end of the barrack range, is used as an ablution house. It has a slate table, and 18 water taps, and the same number of water basins. The ablution table requires a bead, to keep the water from dashing over on the men. Pegs are also required to hang clothes on while washing, and the room requires a ventilator in the roof.

This ablution-room is too far from the men's rooms at the opposite end of the range. It is besides not large enough for the force, and we would recommend that another ablution-room be constructed nearer the other end of the barrack. There are no baths, and space for four will be required. One or two might be placed in the present ablution-room, and space for the others might be provided in the new room.

There is a woman's wash-house close to the ablution-room. It has benches, gratings, and boilers, and appears to be quite large enough for the requirements of the barrack. It is nevertheless defective in its internal arrangements. We would recommend its being fitted up with fixed tubs, and water to be laid on. The boilers should be re-set to consume less fuel, and a small drying closet should be put up, for which there is space enough. There should likewise be a table for ironing linen.

Means of drying and getting up linen are essentially necessary in all barracks. The want of such accommodation has a very injurious effect on the health of the men. When the weather is unfavour-

able, large quantities of wet linen are carried into rooms and kept there, saturating the air with moisture, until an opportunity of drying the linen presents itself, and it is never certain that the men do not put on damp linen. A proper drying apparatus could easily be attached to this wash-house.

We understand that it has been proposed to build a new wash-house at a cost of 560*l.*, which appears to us to be an unnecessary expense.

Means of cooking are provided in a large cook-house, with 20 boilers arranged round a central shaft, and recently a brick baker's oven has been erected in it. The cook-house is well lighted and ventilated.

Water is obtained by contract, from the works of the water company adjoining. There are wells behind the stables, but they do not supply water.

These barracks are only surface drained, and the drainage has its outlet into a ditch by the road side, from whence it flows into a pond. This outlet could not be used for the drainage from latrines, and it will therefore be necessary to find another.

The town of Brighton is partially drained, and if the sewers are laid near to the boundary of the borough, and permission could be obtained to pass the barrack sewage into them, the readiest way of draining the barrack would be to lay a 9-inch pipe along the side of the road to the nearest sewer ; but should there be no sewer sufficiently near, or should it be impossible to obtain permission to drain into it, some other means must be found for disposing of the sewage, and it appears to us that it would be practicable to remove it in the manner described below.

The privies are not drained, but they communicate directly with the manure pits, two privies to each pit. The contractor uses the pit for mixing up the soil with stable dung and ashes, a process which occasions great nuisance.

This method of disposing of the barrack refuse is entirely objectionable, and should be put a stop to ; but it cannot be done unless the privies be drained.

The first thing, therefore, is to decide where the outlet is to be. In the event of there being no access to the town sewers, we should recommend that a closed iron manure tank be erected, near to the boundary wall at the lowest attainable level, and that the tank be sufficiently raised to admit of a closed iron manure cart being placed so that the tank could be emptied into the cart by a valve. If the iron tank could not be placed at such a level as to discharge its contents into a cart, a hand pump would be required for the purpose. The drains from all the privies should be led to the tank, which would receive the daily flushings. We would propose further to convert the privies into water latrines, on Macfarlane's principle, because his latrines require a very small amount of water, and would necessitate a small amount of cartage for removing the sewage. With due care, we are of opinion that this method of getting rid of the soil might be adopted without nuisance, and the matter removed would be valuable manure.

When the privies are reconstructed as water latrines, they should have divisions of seats, half-doors, with sufficient light and ventilation.

All the water-closets within the enclosure should be drained in the same manner, and the cesspits abolished.

The manure pits ought to be filled up to the level of the ground and paved, and the ash-pits ought to be dispensed with. A system of daily cleansing might easily be carried out, whereby little or no accumulation of putrescent matter would take place.

The means of pursuing trades in these barracks consist of one saddler's shop, one for shoemakers, two tailors' shops, and two forges. The tailors' shops require ventilation by a shaft and inlet of the usual construction.

A long one-story building at the gate contains the guard-room, three cells, and the orderly room. The guard-room is low ceiled, and has no means of ventilation. It requires a foul-air shaft and remodelled grate to warm part of the admitted air. The cells are warmed and ventilated, but they are very small, giving only 576 cubic feet to each prisoner.

At one end of the guard-room is an open privy and cesspit, and beside it there is a urinal, apparently without drainage, used also as an ablution place by the soldiers on guard, who wash in an old bucket.

These arrangements illustrate some of the common deficiencies at present existing in guard-rooms, and they should be dealt with under some general system.

Each guard-room should be ventilated and properly warmed. It should have a drying-closet, a water latrine, and urinal properly drained and supplied with water, and a suitable place for the men to wash in.

The canteen tap-rooms require silk flap ventilators in the chimneys, and perforated panes in the windows.

There are no day-rooms, drill sheds, nor married quarters. Troop-rooms are temporarily used for the latter purpose.

There is no serjeants' mess or kitchen, and two nine-men rooms have been taken from the construction for these purposes.

There are no quartermaster's stores, and two attics are temporarily fitted up instead, for which indeed they are better adapted than for barrack-rooms.

There are two good ball courts, but they are uncovered, which renders them useless in wet weather, during which the men remain in their barrack-rooms, instead of taking exercise.

*The following is a Summary of the Sanitary Improvements required for the Cavalry Barracks.*

1. Reduction of the numbers of men in all the rooms to the extent stated.

2. Corridor to be lighted and ventilated by two shafts carried up to the roof, with ventilating skylights above, and perforated glass panes to be put into the upper row of all the windows in the corridor and staircases.

3. Stables to be ventilated by a shaft lined with zinc carried from each corner above the roof. Stable windows to be enlarged.

4. Troop-rooms above the stables to have the covers removed from the ventilating shafts, and each shaft to be carried above the roof. Where there are no shafts a wooden shaft to be carried from the ceiling to above the roof. Each attic room to be ventilated by a louvred ventilating turret carried up through the ridge.

Each troop-room to have one inlet for air with a perforated zinc cornice. The blank window in each troop-room to be opened and glazed.

Non-commissioned officers' rooms to have their ventilation improved in the same manner as that of the troop-room. School-room, to be ventilated by a louvre through the roof, and one of Cundy's stoves to heat the air admitted. Tailors' shop to be ventilated by a shaft and inlet. Canteen tap-rooms to be ventilated by silk flap ventilators in the chimneys and perforated panes in the windows.

5. Barrack-room grates to be remodelled to save heat.

6. A ventilated gas-burner to be introduced into every-barrack room.

7. A second ablution house to be built, four baths to be introduced, two in each house, with water laid on. Pegs to be provided in the present ablution house, and ventilation through the roof.

8. Women's wash-house to be provided with fixed tubs, and water laid on. Boilers to be re-set, and means of drying and getting up linen provided.

9. Barrack drainage to be improved. Privies to be reconstructed as water latrines, with divisions of seats, half-doors, light, and ventilation ; and to be drained, and the sewage disposed of in one of the ways mentioned. All water-closets to be drained, and the cesspits abolished. Urinals to be reconstructed, and supplied with water.

10. Manure pits to be filled up to the level. Ash-pits to be abolished, and arrangements made for the daily cleansing of the barracks.

12. Guard-room to be ventilated and warmed by

a shaft and re-modelled grate. Privy to be converted into a water latrine, urinal to be drained and supplied with water, and proper means of ablution to be provided.

*Cavalry Barrack Hospital.*

This building is situated at the northern angle of the barrack enclosure. It has high ground and a wall behind it, and a high wall at a short distance from the northern end. The situation is therefore somewhat confined, and as the whole line of barracks and stables, with their outhouses, is situated to windward, the air which supplies the hospital is not so pure as it ought to be. The hospital is two stories high, and consists of two wings and a centre. The wings project beyond the centre, both back and front, and contain two wards each. In the centre is a wide passage and entrance hall, on one side of which is the surgery, and on the other the hospital serjeant's room. On the upper floor of the centre there is a small ward, which, at the time we were there, contained six cases of small-pox, crowded into a very small cubic space, because there was no other accommodation for them in the building. Beside this ward there is a pack store, which is complained of as being too small.

There is no orderlies' room, and the attendants have to sleep in the wards among the sick. There is no prisoners' ward, and no place for inspecting recruits, who have to be examined in the long ward before the patients.

The four larger wards are light and cheerful, on account of the number of windows. They are 40 feet long by 20 feet wide, and are entered from the middle of their length. Being at the ends of the building, and at the same time extending from front to back, they have windows on three sides, one window at each end, and five windows along the outer side. The small ward has two windows to the front.

The ground floor wards are 11 feet high, and the upper wards nearly 10 feet.

All the wards are crowded with beds, as will be seen by the following table :—

| Wards. | Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| 1 - | 12 | 7 | 5 |
| 2 - | 12 | 7 | 5 |
| 3 - | 12 | 8 | 4 |
| 4 - | 5 | 2 | 3 |
| 5 - | 12 | 8 | 4 |
| Total - | 53 | 32 | 21 |

The wards will not divide equally into spaces of 1,200 cubic feet each, and we have in the above table given considerably less than that amount per bed. Thirty-two beds, therefore, is the maximum number which these wards ought to contain.

There are no sufficient means of ventilation provided in the building. In the ceiling of each ward are inserted perforated plates communicating with a few small openings in the wall outside, but they are not enough for renewing the air.

We would propose to carry a foul air shaft from the ceiling of each ward to above the roof, and to provide the four large wards with two inlets for air, one at each end, and one inlet for the smaller ward. A few panes of perforated glass should be placed in the upper sashes of the passage windows, to afford air to the passages and staircase.

Each of the larger wards is provided with two fireplaces and old pattern grates. The result is that the fuel rations do not properly warm the wards.

One good remodelled fire-grate would diffuse more heat than both of the present fires, and with a large saving of fuel. Were proper grates put up, a better plan of providing an outlet would be to close one of the existing fire-places, and to use it as a foul air shaft, by making an opening into it, double its sectional area, close to the ceiling. This would be the best way of arranging both for warming and ventilating the wards.

There is no gas in the hospital. We would recommend that it be introduced, and that a ventilated gas-burner be supplied to each ward.

There is no ablution or bath room in the hospital. A suitable room, with one bath, having hot and cold water laid on, and a proper ablution table, with sunk basins, might be easily provided in the manner about to be mentioned.

Behind the hospital is a wash-house, with a bench and gratings, but it has no fixed tubs, and no means of drying or getting up hospital linen. Similar improvements should be introduced into this as into the barrack wash-house already described. Fixed tubs, with water laid on, a drying closet, and means of ironing patients' linen are required.

There is a good kitchen behind the centre of the hospital, connected with it by a passage, and supplied with the means of cooking hospital diets. It is 30 feet high, and extends the whole height of the building. This is quite unnecessary. The upper part, if cut off from the kitchen, would afford a floor area 16 feet by 12 feet 10 inches broad, with ample height, and capable of supplying part of the accommodation required for the hospital. We would propose to throw joists and a ceiling across the kitchen, at the level of the first floor, providing at the same time that a ventilating shaft, a foot square, be carried up from the kitchen through the new ceiling, and above the roof, and that louvred panes be put in the upper sashes of the kitchen windows. We would propose to make an entrance to the space so recovered by a door or doors on the upper floor of the hospital, and to take off so much of the space as would be required for a bath and ablution table. The hot water pipes for the bath might be carried directly from the kitchen to the bath-room. The remainder of the space might be set apart for orderlies, and windows would have to be opened into it. At a comparatively small cost, a great addition might thus be made to the hospital.

There is an ample water supply, derived from the mains of the Brighton Water Company. A great defect is the entire want of drainage, the whole sewage being received into a cesspit close to the ward walls. This requires immediate attention, and the only way to remedy it is to drain the hospital to an outlet along with the barrack, and to fill up the cesspits.

There is one water-closet on the upper floor of the hospital, and the remainder of the accommodation for the sick is supplied by open privies in the yard behind the building. These privies should be drained, and converted into a water latrine on Macfarlane's principle, and the cesspit filled up. Very near to, and in front of the hospital is an offensive privy and cesspit belonging to the workshops. It is not required, and ought to be removed. An ash-pit situated in the hospital yard ought also to be removed, and the refuse carried away daily.

There is no provision nor bedding store, and there is no accommodation for the sick of soldiers' families.

This hospital is too small for the strength, and is destitute of certain obvious conveniences. It could, however, be easily added to by prolonging the end wards in their length, by which the required cubic space could be obtained.

*The following are the Sanitary Improvements we would recommend to be at once carried out :—*

1. Reduction of number of sick in each ward to the extent pointed out.
2. Ventilation of all the wards by a shaft from

the ceiling to above the roof, and by inlets as described. Remodelling the ward grates to save heat.

3. Introducing gas into the building, and supplying a ventilating gas-burner to each ward.

4. An ablution and bath room, with a proper hospital ablution table, having fixed basins, and a bath with hot and cold water laid on, to be provided in the manner pointed out.

5. Hospital to be drained, and the cesspits abolished. Privies in the yard to be reconstructed as a water latrine, with drainage. Privy and cesspit in front of the hospital to be removed, ash-pit to be filled up, and the refuse to be taken away daily.

Lastly, the hospital should be extended to afford the required accommodation for the strength, and a ward should be set apart for the sick of soldiers' families.

### 2. Brighton Infantry Barrack.

This is a very bad barrack, in a close, confined part of Brighton, opposite the Pavilion stables. It is built on ground held on a lease since 1808, nearly expired, and was intended solely as a barrack for a detachment of Foot Guards doing duty at the Pavilion when it was a royal palace. It has, therefore, no officers' quarters, and is destitute of many necessary barrack conveniences.

The site is a close and unhealthy one, and is surrounded by cottage houses, the back offices of which come close up to the barrack-room windows.

The area within the enclosure is one acre and three perches in extent, and the subsoil is chalk. The men's barrack-rooms are in five houses, in two flats, and the stair and passage of each house are both taken out of the rooms, as no space for a staircase has been left in the plans. Each room has three windows, two at the end opposite the entrance, and one near the door. In the lower rooms the back windows look on a high blank wall, at a few feet distance. Each room has regulation space for 16 men. The following table shows the details of the accommodation :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 cubic feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 18 | 288 | 180 | 108 |

If this barrack is to be retained, it ought on no account to have more than 10 men in each room.

The rooms are not ventilated. They have swing windows, which are always being broken, and there are perforated plates in the ceiling communicating with the open air, but they are of little or no use in renewing the atmosphere within the rooms. We would advise that each room be provided with a foul-air shaft, carried up from the ceiling to above the roof, and an inlet for air should also be provided at each end, and covered inside the room by a perforated zinc diffusing cornice. Each staircase window should have perforated glass panes in it for ventilation.

Fire-grates of an old pattern are used for warming the rooms. They ought to be remodelled to save heat.

Although gas is at hand, all the rooms are lighted with candles. We would recommend a ventilated gas-burner to be introduced into each room.

There is no day-room or library, and, properly speaking, there is no school-room, although a troop-room has been temporarily set apart for this latter object. It requires a shaft and inlet for ventilation, like the other barrack-rooms.

There is a tolerably good ablution house with slate benches, water-taps, and basins, situated at rather too great a distance from part of the barrack. It is too dark, and it has no pegs for hanging clothes on. We would recommend additional light to be given through the roof, and a sufficiency of pegs to be provided.

There are no baths. Space for two might be found in the ablution house.

Additional facilities are required for washing linen. The present wash-house has boilers, and benches for tubs, but nothing else. It should have fixed tubs, with water laid on, a drying stove, and means of ironing linen.

There is a tolerably good kitchen provided with boilers, and recently an oven has been added. This latter is apparently good and of economical construction.

An abundant water supply has just been provided for this barrack from the mains of the Brighton Water Company.

There is no drainage except surface drainage, and even this is defective, from the rough nature of the pitch stone pavement in use.

The privies are in a most abominable condition. They consist of a long open seat over an enormous cesspit, the only cover of which consists of the boarded floor of the privy. This cesspit is emptied only at the interval of years, and is a dangerous nuisance, not only to the barracks but to the neighbourhood.

The whole establishment should be properly drained into the town sewers, and those privies ought to be reconstructed as water latrines, with divisions of seats, half-doors, light, and ventilation, and the cesspits ought to be filled up.

Another similar nuisance exists at one end of the barrack range, close under the windows of the soldiers' rooms. It is a large deep offensive ash-pit, so placed that the emanations from it must infect the surrounding atmosphere. This nuisance ought to be abolished forthwith ; the ash-pit ought to be filled up, and an iron cart provided for the daily collection and removal of barrack refuse.

There are no non-commissioned officers' quarters nor mess-room on the construction. There is no drill shed. The boundary wall on one side is so low that soldiers can break out of barracks by climbing over it.

Although at present occupied by cavalry, there are no stables and no officers' quarters belonging to this barrack. In order to supply the deficiency, the stables and riding school belonging to the Pavilion are rented from the Corporation for short periods.

The stables consist of a circular court covered by a large dome, partly of glass, and with large ventilating apertures at the summit. Round the ground floor of this dome are ranged the stables, the only light and ventilation of which come from the court. Above the stables is a circular gallery giving entrance to what were formerly the rooms of the stable servants, and which are now set apart for cavalry officers. The whole arrangements of these stables, however fine they may be in appearance, are amongst the very worst for either men or horses that could be devised. It is impossible to ventilate them except at a large outlay, for the whole interior of the dome, although all the passages and ventilators were open, was close and offensive. It was like the inside of an unventilated stable with the doors shut. The officers' rooms were in the same condition, and it was stated to us that at night the smell in them is past endurance. The rooms are low, badly lighted, and unventilated attics, not fit for habitation ; and it can only excite surprise that they were ever thought of as officers' quarters. There are other officers' quarters, not much better, in high buildings round a narrow court in which a manure heap had been placed. We would recommend all of them to be given up forthwith, and other quarters to be provided.

The riding school has a large number of horses stabled in it, and the ventilation was very bad at the time we were there ; something might be done to improve it by large louvres in the roof on Muir's or Watson's principle.

With regard to the infantry barrack itself, the best thing to do would be to give it up. It would be much better to erect huts for the men than keep them there. We have no doubt that part of the heavy sick and death rate from zymotic disease we have mentioned is due to this barrack. If, however, it must be used, we should advise the following sanitary improvememts to be carried out without delay :—

1. Reduction of the number of men from 16 to 10 men per room.
2. Ventilation of every barrack-room and the school-room by a shaft and two inlets for air. Ventilation of the staircase by perforated panes of glass in the windows. Fire-grates to be remodelled.
3. A ventilated gas-burner to be introduced into each barrack-room.
4. Ablution house to be lighted by glass slates in the roof, and to have pegs put up. Two baths with water laid on to be provided.
5. Wash-house to have fixed tubs and water laid on ; and a drying stove and means of ironing linen to be provided.
6. Privies to be reconstructed as water latrines, with divisions of seats, half-doors, light, and ventilation, and the cesspit filled up. Ash-pit to be filled up, and an iron cart provided for the collection and daily removal of barrack refuse.
7. Officers' quarters in the Pavilion stables to be evacuated.

## EXETER AND BRISTOL.

SIR,

WE have the honour of laying before you the following interim report of our enquiry and examination into the sanitary condition of the barracks and hospitals at Exeter and Bristol.

### I. EXETER.

There are two barracks near this city, one for cavalry, situated in the immediate outskirts ; the other, for artillery, at Topsham, at a short distance in the country.

#### 1. THE CAVALRY BARRACK.

This barrack is situated on a hill to the west of the town, about half a mile from the river Exe. The site is isolated from buildings. It is seven acres and three quarters in extent, and the subsoil is clay. The ground has a good slope from the highest point towards the main road.

The buildings are of brick, and were erected in 1794–95. They lie nearly north and south, and form three sides of a parallelogram. Along the highest end of the ground are placed the officers' quarters, the riding school, and orderly room. Along the two sides are the stables, with one floor and an attic of men's rooms over them. In the same line, on each side, are other buildings, workshops, privies, the hospital, canteen, &c., and the fourth side of the parallelogram is completed by the gate, guard-room, cells, &c.

Surrounded by these buildings there is a large central parade ground. It is surface-drained, and has a good fall, but not being under-drained it was soft and sloppy at the time we saw it. The whole area requires to be tile-drained to render it dry and firm.

The ground along the barrack ranges, as well as the interior of the stables and the back yards, are paved with boulders, very rough, and not conducive either to cleanliness or to good surface drainage. Whenever this paving requires renewal, close square setts ought to be substituted for it throughout.

The barrack rooms are over the stables, and enter right and left from a central corridor, imperfectly lighted and ventilated, and extending from end to end of the range. This corridor is reached from below by two stone staircases, placed at about a quarter of the length of the range from either end. It is lighted by a window at each end, which windows are separated the one from the other by the whole length of the range ; and about the middle there is a wooden grating in the ceiling of the corridor, used for raising stores to the attic, through which a little light is admitted to a small area of the corridor from a skylight in the roof above.

Both the lighting and ventilation of this corridor require to be improved, by carrying up two plastered shafts the square of the entire breadth of the passage from its ceiling to the roof, and admitting light and air from above by a large ventilating skylight. The end windows of the corridor also require perforated panes of glass in their upper sashes, for the admission of fresh air. The attic itself is used for stores and workshops, and in one part of it there were a few men quartered. In its present state it is not fit for occupation by men.

The barrack-rooms enter right and left from the corridor, and hence they have windows to the open air only on one side. Some of the rooms have three windows, but some have only one window, placed near the fire, leaving by this arrangement the whole end of the room in darkness. In all the rooms having one window another window ought to be opened.

The total regulation accommodation of the barrack-rooms is for 204 non-commissioned officers and men. There are 24 soldiers' rooms, containing, with two or three exceptions, 8 men in each, having about 540 cubic feet per man. The following table shows the number of men required to be removed in order to allow 600 cubic feet for each :

| Rooms. | Total present Regulation Number of Men. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Right Wing :— | | | |
| No. 5 - - - - | 6 | 5 | 1 |
| Nos. 6, 7, 8, 9, 10, 11, 13, 14, 15. | 72 | 63 | 9 |
| No. 12 - - - - | 8 | 5 | 3 |
| Nos. 18, 19 - - - | 10 | 8 | 2 |
| Left Wing :— | | | |
| No. 4 - - - - | 8 | 5 | 3 |
| Nos. 5, 6, 7, 9, 10, 11, 12, 14, 15, 16. | 80 | 70 | 10 |
| Total - - | 184 | 156 | 28 |

This table shows a deficiency of sleeping space for 28 men.

By removing three men out of No. 12 in the right wing, and out of No. 4 in the left wing, and one man out of each of the other rooms, 600 cubic feet will be left for the remaining inmates.

Although the rooms have openings in the ceilings with sliding covers, none of them are properly ventilated. To provide for this, a shaft will have to be carried from the ceiling of each room above the roof, and an inlet for air, covered within the room by a perforated zinc cornice, will have to be inserted in the outer wall close to the ceiling. The existing openings in the ceilings ought then to be closed.

Each of the non-commissioned officers' rooms requires a silk flap ventilator in the chimney.

The barrack-room grates are of the old pattern, and might be advantageously remodelled to save fuel.

One barrack-room is used as a school-room and library. It requires additional light and ventilation, like the other rooms.

The stables require thorough ventilation, to prevent the fumes reaching the barrack-rooms above. With this object, shafts, carefully lined with sheet zinc, soldered, should be carried from the four corners of each stable to above the roof of the buildings. Inlets for air should be placed near the ceilings. The stables also require additional window space.

At the foot of each staircase is a large room. One of these rooms in each block is appropriated as a cook-house, and is fitted up with seven boilers. There are no other means of cooking except boiling. A proper ventilated roasting oven is required in each cook-house to supply this defect. The cook-houses are rather dark, and require more window space. They should also be ventilated by carrying a shaft, 18 inches square, from the ceiling through the roof, and perforated panes of glass should at the same time be placed in the upper window sashes.

One of these lower rooms is used as a serjeants' mess, and requires ventilation by panes in the upper window sashes. There are two ablution houses, one in either wing, built against the end wall of the range ; they have each a metal tank, benches, gratings, basins, with water laid on. The rooms are low in the roof, and too dark ; they might be sufficiently lighted by a few glass slates in the roof. They require a louvre in the roof and perforated glass panes in the windows for ventilation. These rooms have no pegs.

There are no baths, but as there is plenty of space and abundance of water, this deficiency admits of easy remedy. A bath house, with two baths, and water laid on, are required.

The women's wash-house is narrow and inconvenient. It has a boiler and gratings, but it has no fixed tubs, and is not provided with means of drying or getting up linen. It requires ventilation by perforated panes in the upper sash of the windows ; fixed tubs, with water laid on, and a drying and laundry stove. Space for drying and getting up linen might be obtained by adding a room on purpose.

The privies were, until recently, of the usual construction, but while we were at the barracks, water latrines, on Salter's principle, were being constructed on one side of the barrack ; similar latrines were to be erected on the opposite side. They will remove the nuisance, but some points in the construction still require improvement. The water receptacles are too deep ; hence they require a great deal more water than is actually needed for receiving and removing the soil. The seats are divided from each other by partitions about two feet high, instead of being carried the height of a man. The buildings containing the latrines are low, narrow, and not light enough; they should be lighted and ventilated through the roof.

The urinals require to be supplied with water.

The water supply for these barracks is abundant and good. It is derived from the works of the Exeter Water Company, and enough can be obtained for any required purposes of health.

The barrack is lighted by candles, although gas can be obtained ; every barrack-room should be provided with a ventilated gas-burner.

There is no day-room nor drill shed.

The library and reading-room, as already stated, is a barrack-room. Separate accommodation for reading is much required.

There is no accommodation for married people except misappropriated barrack-rooms, where families are mixed up together in the most unseemly manner. Married quarters are very much needed in this barrack.

The guard-room is dark, and requires ventilation by a shaft through the roof, and by inlets in the outer walls. Additional light might be supplied by a skylight.

There is no lock-up, but there are four cells adjoining the guard-room.

The canteen tap-room and the room for non-commissioned officers require ventilation by a large silk flap ventilator into the chimney, and by perforated panes of glass in the windows. The upper sash of each window should also be made to open.

*The Sanitary Improvements required for Exeter Cavalry Barracks are as follow :—*

1. Reduction of number of men to the extent stated.

2. Ventilation and lighting of the corridors by two plastered shafts, the square of the breadth of the corridor, carried up from the ceiling to the roof, the shaft to be covered above by a ventilating skylight. Perforated glass panes to be put into the upper sash of the end windows of the corridor.

3. Each barrack-room to be ventilated by a shaft carried from the ceiling to above the roof, and by an inlet and perforated zinc cornice. The library and reading-room to be similarly ventilated. An additional window to be opened in every barrack-room having at present only one window. Every non-commissioned officer's room to have a silk flap ventilator into the chimney. Serjeants' mess-room to be ventilated by a silk flap ventilator and by perforated panes in the windows. Barrack-rooms to have remodelled grates. Guard-room to be ventilated by a shaft and inlet for air. Fire-grate to be altered to warm part of the air admitted ; additional light to be afforded by a skylight. Canteen tap-rooms to be ventilated by silk flap ventilators, perforated glass panes, and by making the upper sash of the windows to open. Stables to be ventilated by shafts lined with zinc, and by inlets ; and to have more window space.

4. Kitchens to be provided with ventilated roasting ovens, to have additional window space, and to be ventilated by a shaft and perforated glass panes.

5. Ablution houses to be provided with pegs ; to be lighted by glass slates, and to be ventilated by a louvre in the roof, and by perforated glass panes in the windows.

6. A bath-house, with two fixed baths, and water laid on, to be provided.

7. Women's wash-house to be enlarged, and provided with fixed tubs, and water laid on, and with a drying stove. Perforated glass panes to be introduced into the upper sash of each window.

8. New buildings for the latrines to be lighted and ventilated through the roof. The divisions to be carried higher up.

9. Urinals to be supplied with water.

10. A ventilated gas-burner to be introduced into each barrack-room.

Lastly. Married quarters and a library are much required at these barracks.

*Cavalry Barrack Hospital.*

This is a separate house, standing in line with one of the barrack ranges on the lower slope of the parade ground. It is two stories high, and is divided up the middle by a wooden staircase affording access to the upper flat. On either side the staircase, both above and below, there is a short corridor with windows, extending right and left, and giving access to the wards, stores, surgery, kitchen, &c.

There are in all six wards ; they are much overcrowded, as will be seen by the following table of accommodation :—

| Wards. | Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 7 | 4 | 3 |
| 2 | 5 | 3 | 2 |
| 3 | 4 | 2 | 2 |
| 4 | 7 | 4 | 3 |
| 5 | 6 | 3 | 3 |
| 6 | 4 | 2 | 2 |
| Total - | 33 | 18 | 15 |

The cubic space of the wards will not divide equally so as to give 1,200 feet per bed. There is in each case a small remainder over that amount, but this building ought not to contain more than 18 or 20 sick at the outside.

The wards entering at the end of the corridor have windows on two ends ; the wards entering from the side of the corridor have windows only on one side to the open air. This arrangement does not admit of proper ventilation or lighting of the wards.

There are openings in the ceiling for ventilation, similar to those in the barrack-rooms, but they are insufficient. It will be necessary to ventilate each ward by a shaft carried up from the ceiling to above the roof, and by an inlet communicating with the outer air on each side, covered by a perforated zinc cornice, for diffusing the air within the ward.

All the ward grates might be advantageously remodelled to save fuel.

The corridors and staircase require ventilation by perforated glass panes in all the windows. If practicable also, an additional window should be made in each end ward.

The kitchen is under one of the wards. It requires ventilation by a shaft carried up from the ceiling to above the roof, and perforated glass panes in the windows.

The wash-house, which is immediately connected with the hospital, is not ventilated, and has no outlet for the vapour. It requires a louvre in the roof. There are no means of drying or getting up linen. A proper stove is needed for this purpose.

There are two water-closets, one on each floor ; they are dark, as well as the lobbies leading to them. The lobbies should have a window on both sides, with perforated glass panes in the upper sashes.

There is no bath-room, except the dead-house, to which patients go to take a shower bath. A proper bath-room, with a fixed bath, and hot and cold water laid on is required. At the time this is done, provision should be made for lavatory accommodation for the sick, of which there is none at present, except the women's wash-house, a most improper place for the purpose.

There is an offensive privy and cesspit in the yard behind the hospital. The privy should be converted into a water latrine, and the cesspit abolished.

This hospital is very defective, both in structure and in internal arrangement, and is not well suited for its purpose. It would do for married quarters, and another hospital might be built with great advantage to the sick.

*The Sanitary Improvements required in the present Building are as follow :—*

1. Reduction of the number of beds to the extent stated, to give 1,200 cubic feet to each patient.

2. Ventilation of the staircase and corridor by perforated glass panes in all the windows, and by additional windows with perforated glass panes in the lobbies leading to the water-closets.

3. Ventilation of each ward by a shaft and two inlets for air, with perforated zinc cornices. Fire-grates to be altered to warm part of the air admitted.

4. Ventilation of the kitchen by a shaft and perforated glass panes.

5. Ventilation of the wash-house by a louvre. Means of drying and getting up hospital linen to be added to the wash-house.

6. A bath-room and lavatory, with one bath and hot and cold water, to be provided.

7. Privy in the yard to be reconstructed as a water latrine, and the cesspit abolished.

## 2.—Artillery Barracks, Topsham.

These barracks are situated close to the high road about a mile and a half from the outskirts of the city of Exeter, on elevated ground, with a good slope to the river Exe, which passes the site at about a furlong distant.

The area within the barrack enclosure is 9½ acres in extent. The site is in the country, and healthy.

All the buildings are of brick, and were erected in 1805–6. They are arranged in an oblong square. The higher end is formed by men's quarters, with the officer's quarters in the centre. Opposite these, near the gate, are blocks of men's quarters, and the barrack offices. On each side the square are the stable blocks, with stores over them.

The parade ground occupies the middle of the square. It is very much raised in the middle, and has no drainage except on the surface, and as the subsoil is clay, the area is wet and sloppy in damp weather.

It would be a great improvement to lower the parade ground in the middle, but at all events it should all be tile-drained, to make it dry and firm.

The barrack-rooms are in separate houses, two stories high, with two rooms on each floor entering from a central passage, and wooden staircase. On the southern side these staircases have windows on both sides ; but on the northern side the stair windows face only to the parade ground. An additional window should be made through the back wall of the staircases on the northern side.

The barrack-rooms have no means of thorough ventilation, from having windows only on one side, with a dead wall opposite, along which the beds are ranged. It would be very advisable to remedy this defect by opening two additional windows in each room.

The rooms vary a little in size. They are from 26 to 30 feet in length, about 20 feet in breadth, and from 8 feet 6 to 9 feet 6 high. They are all 12-men rooms, and allow by present regulation from 380 to 450 cubic feet per man. The total accommodation is for 338 non-commissioned officers and men.

The following table shows the extent to which the regulation number of inmates of each room exceeds the available accommodation, at somewhat less than 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 1, 2, 3, 4, 27, 28, 31, 32. | 96 | 64 | 32 |
| Nos. 5, 6, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 24, 25, 26, 29, 30. | 240 | 180 | 60 |
| Total - - | 336 | 244 | 92 |

The open airy position of this barrack enables us to allow a larger number of men per room than we should feel disposed to do were the barrack situated in a town, and yet there is a deficiency of accommodation for 92 men. In effecting the required reductions, four men ought to be removed out of each of

the first group of rooms in the table, and three men out of each of the rooms in the second group.

None of the barrack-rooms are ventilated, and as they are also deficient in windows, the atmosphere in them is very close and foul. Besides two additional windows to the back, each room requires a ventilating shaft to be carried up from the ceiling to above the roof, to permit of the egress of foul air, and two inlets for fresh air, with perforated zinc diffusing cornices, one on each side the room close to the ceiling. The fire-grates are of the old model, and waste much heat. These grates should be remodelled for warming part of the admitted air.

Each staircase ought also to be ventilated by a shaft carried up from its ceiling above the roof, and by perforated panes in the windows.

The rooms are lighted by candles. Gas ought to be introduced whenever the mains are brought sufficiently near.

There is no day-room nor school-room. At present there is no library, but one has been provided for in this year's estimates.

There are no ablution houses. The men wash in a stable in which a few basins are placed on the ground for their use. Neither are there any baths.

Ablution-rooms and four baths are provided in the present annual estimate, but the position which has been selected for them is an objectionable one. It is proposed to build them behind the centre of the stable ranges where there are no soldiers' quarters, and at as great a distance as possible from the men's rooms.

A position should be selected for both ablution-rooms and baths, close to the men's rooms, and, if possible, connected with them by a covered communication. The proposed position for them is inadmissible, from considerations of health.

There are two women's wash-houses in rear of the stable ranges; they are small and dull. They have no fixed tubs, and only one boiler each. There are no means of drying or getting up linen.

A proper drying and laundry stove is required. More light should be given through the roof, and fixed tubs should be provided.

There are two cook-houses, one in the rear of each wing. They have each seven boilers, but they have no other means of cooking. Each cook-house requires a roasting oven.

There are no cleaning rooms, and no covered drill sheds; but there are extensive gun sheds at one angle of the barrack enclosure, which might very well be used for drilling in wet weather. It is also proposed to construct a verandah at the orderly room for the men to stand under in bad weather.

The barrack is provided with the usual artillery workshops.

Water is obtained from the Exeter Water Company. It is received in four tanks, each of 3,500 gallons capacity. There are besides nine pump wells and four small rain-water tanks.

The drainage and sewerage of the whole barrack are defective, and require to be carried out on an improved plan. As already stated, the parade ground requires under draining, an improvement which might be advantageously extended to the whole area within the barrack enclosure.

The privies have no drainage, and empty their fluid contents into large open manure pits behind the stable ranges. These pits are deep, and receive the subsoil water from the adjacent ground. One of them was nearly full of water saturated with cesspool matter, the odour from which was most noxious and offensive. At the time we were there, a man was baling out the green stinking fluid on to the surface, over which it was running to the nearest gully grate, whence it appeared to flow back again into the pit; but we could obtain no satisfactory information as to the course of the surface drains.

The remedy for this nuisance is to reconstruct the privies as water latrines with divisions, half-doors, light and ventilation, and to drain them to an outlet. The manure pits should at the same time be filled up to the level of the ground and paved, and provision made for the daily removal of the manure, and other barrack refuse. This could be easily done in connexion with the daily cleansing of the cavalry barrack.

In carrying out these improvements, the first thing to be done is to find an outlet for the drainage. There is an excellent fall to the river, but the outlet would have to be carried through private property. The superficial drainage, as we have been informed, is at present carried in underground drains, partly into a pool in a field near the barrack, whence it flows over a field, and finally into the river.

There is no reason why the privy drainage should not be disposed of in a similar manner. A cesspit would have to be provided in the field, into which the flushings of the latrines would be carried, and the overflow would make valuable manure for grass land, or it might be allowed to run to the river in a roughly paved channel, which would tend materially to deodorize the fluid. The solid matter might then be removed from the cesspit from time to time for manure, but in all probability it would seldom have to be disturbed. Any way an outlet will have to be obtained to abate the nuisance at present existing.

Properly constructed urinals, supplied with water, ought also to be provided.

The guard-room requires ventilation by a shaft, and inlets for air. The lock-up is a long way from the guard-room. It is, in fact, at the opposite end of the barrack enclosure, and there is in reality no lock-up so far as the guard-room is concerned.

There is a troop stable one story high near the guard-room at the end of the nearest block of stables, which would afford a site for a lock-up, but in that case, the stable would have to be rebuilt elsewhere.

The orderly room is also a long way from the guard-room.

A urinal, privy, and ablution-room are required for the guard-room.

There are two cells, but more are required.

There is a good canteen, but the tap and non-commissioned officers' rooms require ventilation by silk flap ventilators into each chimney, and by a pane of perforated glass placed in the upper sash of each window. There are no married quarters in these barracks.

*The following are the Improvements required:—*

1. Reduction of the number of men in each barrack-room to the extent specified above.

2. Opening additional windows through the back wall of each barrack-room. Also in the back wall of each staircase on the northern side of the enclosure.

3. Ventilation of each barrack-room by a shaft and two inlets for air as described. Ventilation of each staircase by a shaft from the ceiling, and by perforated glass panes in the windows. Ventilation of the guard-room by a shaft and inlet. Ventilation of the non-commissioned officers' room and tap room in the canteen by a silk flap valve into the chimney, and by a perforated glass pane in the upper sash of each window. Remodelling of the barrack-room and guard-room grates, to save heat.

4. Ablution and bath-houses to be constructed close to the men's rooms.

5. Women's wash-houses to have additional light through the roof, fixed tubs, and drying and laundry stoves.

6. Each cook-house to have a ventilated roasting oven provided.

7. The barrack to be sewered to an outlet in one of the modes suggested. The parade-ground to be under-drained. All the privies within the enclosure to be reconstructed as water latrines, with divisions, half-doors, light, ventilation, and drainage. All cesspits to be abolished, and the manure pits to be filled up to the surface level.

8. Manure and barrack refuse to be collected and removed daily.

9. A urinal, privy, and ablution-room to be provided at the guard-room.

Lastly, married quarters, a day-room, and reading-room ought to be provided.

*Artillery Barrack Hospital.*

The hospital stands on the north-east of the barrack enclosure, in a space surrounded by a high wall, which impedes the external ventilation of the building. It consists of a centre, two stories high, and two low wings, one story high. The wards are situated in the top flat of the centre buildings, with the exception of one ward in one of the wings, which is on the ground floor. There are in all six wards, with 30 beds. The following table shows the accommodation :—

| Wards. | Number of Beds according to existing Regulation. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 6 | 4 | 2 |
| 2 | 5 | 4 | 1 |
| 3 | 5 | 4 | 1 |
| 4 | 4 | 2 | 2 |
| 5 | 5 | 4 | 1 |
| 6 | 5 | 4 | 1 |
| Total - | 30 | 22 | 8 |

By giving somewhat less than 1,200 cubic feet per bed this building will accommodate 22 sick in these six wards.

The wards are small and unventilated, and the windows only open below. All the sashes must be made to open at the top, and each ward requires a shaft and two inlets for air, similar to those recommended for the barrack-rooms. The ward grates are of the old pattern, and should be remodelled to save heat, and warm part of the admitted air in winter. One of the wards is used by orderlies when not otherwise occupied. If it is required for sick the orderlies sleep among the patients. This practice should be discontinued in all hospitals, and suitable accommodation ought to be set apart for the orderlies.

There is a light roomy hall and staircase in the central building. It requires ventilation by a shaft through the ceiling, and by perforated glass panes in the stair window.

Behind each wing of the hospital there is a small enclosed court-yard, surrounded by one-story buildings, in which are placed not only the privies for the sick and for the officers, but the cesspits into which the privies empty themselves, and which receive the rain water also. They were most offensive and noxious. Close to one of these privies is the bath-room, containing a shower-bath, and a large square dirty looking cistern used as a fixed bath. It has no water laid on. It is uselessly large ; so large, indeed, that it requires a fatigue party to fill it. One side of this court-yard is formed by a sick ward, along the outside of which a covered verandah is carried to afford access to the privy and bath-room.

The court-yard, behind the opposite wing, contains an offensive privy and cesspit, adjoining which, on one side is the wash-house, and on the other side, the kitchen. The surplus water of the yard flows into the privy cesspit.

The wash-house requires ventilation through the roof. It has no fixed tubs, and it was stated that the urine tubs were used as wash tubs. There is no drying stove, or other means of getting up patients' linen.

The first step for improving these outbuildings is to drain the hospital in connexion with the barrack, and to lay on water.

This is absolutely necessary before anything effectual can be done. Next, the cesspits should be abolished, and water-closets put up instead of the present privies.

The bath-room should be reconstructed, the present unsightly and useless bath removed, and a proper bath, with hot and cold water laid on provided. The wash-house should have fixed tubs, with water laid on. It should be properly drained and ventilated, and have a drying and laundry stove provided.

The hospital kitchen is imperfectly provided with the means of cooking diets, and it requires ventilation through the roof. A proper cooking range (one of Flavell's) should be introduced.

There is no ablution-room. Space might be found for the required accommodation in the bath-room. There is no space for receiving the sick of soldiers' families.

*The following are the Sanitary Improvements required :—*

1. Reduction of numbers of sick to the extent stated.

2. Ward windows to be made to draw down at top. Ventilation of each ward by a shaft, and two inlets for air. Ventilation of the staircase by a shaft through the ceiling, and by perforated panes in the window. Ward grates to be remodelled.

3. The hospital to be drained along with the barrack, the cesspits to be abolished, and the privies converted into water-closets, properly ventilated, and with water laid on.

4. Bath-room to be re-arranged, the present bath removed, and a proper bath, with hot and cold water laid on, provided instead. Lavatory accommodation to be likewise provided.

5. Wash-house to be ventilated through the roof, and to have fixed tubs, with water laid on, and a drying and laundry stove provided.

6. Kitchen to be ventilated through the roof, and to have a proper cooking range.

While recommending those improvements as essential for this hospital, we must at the same time express our decided opinion that the buildings would be best applied to the purposes of married quarters, in which case a new hospital would have to be built.

## II. BRISTOL.

There are two barracks in Bristol and its vicinity ; one at the lower end of the city, the other at Horfield, on the Bath road.

### 1. Gloucester Hotel Barrack.

This barrack is the old Gloucester Hotel, which has been taken on lease for receiving and passing recruits, of whom from 300 to 800 are examined and passed every month at this station. About 13 years of the lease are unexpired. The buildings are situated at the foot of a very steep hill under Clifton Downs, and close to the river Avon. The hotel itself consists of several flats of large, lofty, well-lighted rooms, reached by wide staircases lighted from above. One of these rooms is an old ball room, one wall of which is bulged inwards, and has rather an unsafe appearance. The house generally is not in good repair ; and it is deficient in some important points affecting health and comfort. It is true that none of the recruits remain above a few days in the house ; but, although this fact may afford a reason for limiting the expenditure for improvements to the most necessary matters, still the things which are necessary ought to be done.

For example, much of the interior of the house is dirty. Nothing appears to have been done in the way of lime-washing or cleansing the ground floor, staircases, &c. A number of the rooms are papered, and apparently do not require cleansing at present, but the parts that do require it should be lime-washed,

and moreover, paper, on account of its power of absorbing emanations, is a bad material for the walls of rooms in which a large number of persons live or sleep.

Several of the occupied sleeping-rooms are directly overlooked from the windows of the better class of dwelling houses on the slope of the hill immediately behind. The glass in the lower sashes of these room windows has been obscured to a certain extent, but it ought to be done in both upper and lower sashes in all the windows of the soldiers' rooms that are overlooked.

None of the rooms are ventilated. As, however, the numbers of men occupying them vary very much, it is probable that a sufficient amount of ventilation can be obtained by openings into the chimneys. We would therefore advise that a large size silk flap ventilator be placed in each chimney flue throughout the building, including those flues in the ball room, the fire-places of which have been bricked up. Each room will, in addition, require inlets for air; and we think it would probably be sufficient for the purpose to insert a pane of perforated glass into the upper sash of each window.

The staircases should also have more ventilation; which could easily be afforded by openings under the skylights.

The hotel kitchen is used as an ablution-room. The only conveniences it had for the purpose when we saw it were the old kitchen sink and one basin. The place was very dirty. The floor was uneven, and foul water was lying on it. There is no bath.

We would advise that this kitchen be properly drained, cleansed, and repaired, and that the floor be levelled: that an ablution table, with water laid on, gratings, and pegs be provided; and that a bath for washing recruits, similar to the one at the Westminster recruiting office, be constructed.

A small room on the ground floor has racks for hanging up wet great coats, but there are no means of drying them. The least expensive way of supplying this deficiency would be to put a stove in the room, to bring in fresh air from the outside under the stove, and to provide an outlet for the moisture by a silk flap ventilator into the chimney, and by perforated glass panes in the windows.

The hotel scullery is now used as a guard-room, and the wine cellar is the lock-up. The guard-room is rendered unnecessarily dark by having part of the window boarded. The lock-up wants ventilation. For the latter purpose an opening should be made through the wall between the lock-up and the guard-room, and a silk flap ventilator placed in the guard-room chimney. The boards should also be removed from the guard-room window.

There is no cook-house where recruits can cook their meals, except the fireplace in the old hotel bar. It affords no conveniences over those of an ordinary public house. It might be worth while to consider whether the usual method of providing meals for recruits could not be improved, not only at this, but at all recruiting stations.

The usual allowance per head of coal is drawn for each recruit, but as the recruits are not allowed the use of their barrack-rooms in the daytime, and there are consequently no res, it does not appear how the coal is expended.

There is an outbuilding in the yard adjoining the hotel, in which a line of open drained privies has been put up. They are very offensive, and should be re-constructed as water latrines, with divisions of seats and half-doors. The urinals ought also to be supplied with water.

*We would recommend, then:—*

1. That the whole barrack be cleansed, lime-washed, and repaired where necessary, and that all the glass in the windows of barrack-rooms overlooked by neighbouring dwelling-houses be obscured.

2. That a large size silk flap ventilator be placed in every chimney in the barrack-rooms, and one perforated glass pane in every window; that the staircases have additional ventilation at the skylights; that the drying-room be ventilated as described, and be provided with a stove; that the guard-room and lock-up be ventilated as described, and the boarding removed from the guard-room window.

3. That the kitchen be converted into a proper ablution-room and bath-room, and the floor drained and levelled.

4. That the privies be re-constructed as water latrines, with divisions of seats and half-doors, and the urinals supplied with water.

*The Hospital.*

At a short distance from Gloucester Hotel barrack is a small fourth or fifth rate house, which is rented from quarter to quarter as an hospital. It has none of the conveniences of a place for receiving and treating sick. The wards are small bedrooms, and have no ventilation. They could be somewhat improved in this particular by silk flap ventilators in the chimneys, and perforated glass panes in the windows; but even if this were done the place would still be so ill adapted for its object that it might be desirable to set apart a ward for sick in the hotel itself, if it be practicable to do so. There are seldom above one or two sick from among the recruits under treatment at the same time.

Among other defects, the present hospital has no water-closet, but only an open privy in the yard, placed over a drain without any intermediate trap.

*If the present Hospital is to be retained, we should recommend:—*

1. That each room used for sick be ventilated by a silk flap ventilator, and a perforated glass pane, and that means be taken to ventilate the staircase.

2. That the drain from the privy be trapped.

2. Horfield Barracks.

These barracks are built on sloping ground, near the high road from Bristol to Bath, and about four miles from the former city. They are built of stone, are of recent construction, and are intended for the accommodation of 108 cavalry and 320 infantry. They are at the present occupied by the military train. The barrack enclosure is defensible, and the buildings form a square, the upper side of which is occupied by officers' quarters, having the barrack-master's house at one end and the hospital at the other. The infantry barracks extend down the slope on one side, and opposite them are the barrack-master's office and stores, the provost establishment, and the guard.

The cavalry barrack-rooms are over the stables, and front the officers' quarters at the lower end of the enclosure. A riding-school stands in the square in front of the cavalry range. Through the middle of this range there is an archway, over which are placed a reading-room and library, with a librarian's quarter, and serjeants' quarter.

At the higher end of the infantry range are situated the orderly room, pay serjeants' room, and staff serjeants' quarters, and at the lower end are the serjeants' mess establishment, and the tailors' and shoemakers' shop.

Behind the ranges are the usual barrack conveniences, ablution-room, cook-houses, &c., and behind the cavalry range there are the infirmary stables, guard-room, &c.

The general arrangement of the buildings is good, convenient, and healthy.

The rooms in the *cavalry barracks* are above the stables, and are reached by staircases and passages, into which the stables open. They are all of the same dimensions, namely 28 ft. by 22 ft., and 10 ft. 6 in. high. They contain 12 men each. Besides these rooms there are two 6-men rooms in J. house. The accommodation in both sets of rooms is shown in the following table:—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 8 | 96 | 80 | 16 |
| J. House. | | | |
| 9 | 6 | 5 | 1 |
| 10 | 6 | 6 | — |
| Total - | 108 | 91 | 17 |

The cavalry rooms are not of so healthy a construction as the infantry rooms. They are built back to back, with three windows only on one side. The means of light and ventilation are much less advantageous than in the infantry barracks. In the above table we have therefore allowed as near as may be 600 cubic feet of space per man.

None of the rooms are ventilated. Each 12-men room requires a shaft and two inlets for air. The shaft should be carried up from the ceiling near the fireplace to above the roof, and the inlets should be placed in the outer wall, close to the ceiling at each end of the room.

The staircases leading to the cavalry rooms should be ventilated by perforated glass panes in the windows, and the serjeants' room at the top of each staircase should have a silk flap ventilator into the chimney. At the foot of each staircase two doors open right and left into the stables. These doors permit the fumes to pass into the rooms above. They are quite unnecessary, and ought to be built up.

*The infantry barracks* are two stories high, and are arranged in houses containing each four barrack-rooms, and two serjeants' rooms, entered by a common passage and spacious stone staircase. There are two barrack-rooms, and one serjeants' room to each flat. All the rooms are 33 feet 9 inches long, by 20 feet wide. The lower rooms are 11 feet 9 inches high, and the upper rooms are 10 feet 6 inches high. They have all four windows, two on each side to the external air. The windows are of a good height and breadth, and the rooms are well lighted. Each room has regulation accommodation for 16 men, so that the amount of cubic space varies in each flat. The present regulation accommodation, in comparison with what it would be at about 600 cubic feet per man, is given in the following table :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 10 Lower - | 160 | 140 | 20 |
| 10 Upper - | 160 | 120 | 40 |
| 20 | 320 | 260 | 60 |

In every room we have allowed, as nearly as may be, the same amount of cubic space per man ; but as the contents will not divide into equal proportions of 600 cubic feet, we have, in consideration of the healthy structure of the barrack, allowed in every instance less than that amount.

None of the rooms are ventilated. We would recommend that a ventilating shaft be carried up from the ceiling of the room, near the fireplace, to above the roof ; and that two inlets for air, with perforated zinc cornices, be placed close to the ceiling at each end of the room, between the windows. Each serjeant's room requires a silk flap ventilator into the chimney. The staircases should have ventilation provided by panes of perforated glass in the upper sash of each window.

Each room has a fireplace, with a grate of the old pattern. It is in the middle of the length of the room, opposite the door. The position is not a very good one for the comfort of the men, but the defect has been to a considerable extent remedied, by constructing a wooden porch to the door, inside the room. All the barrack-rooms are lighted by candles, and the exterior by oil lamps. There are gas mains within about half a mile of the enclosure, and it is worthy of consideration whether gas should not be supplied to the whole establishment. There is no day-room belonging to these barracks.

There is a good chapel school which has been recently erected. We are informed that in this building the benches have been placed so close together that the men cannot stand up. Additional ventilation might be given with advantage, by raising the ridge tiles. There is no porch to the building, and complaint is made of the cold air rushing in every time the door is opened. An inner porch of wood would remedy the defect.

The barrack is built of a soft cream-coloured stone, which is exposed in the interior of the rooms without being plastered. The surface within the rooms is kept clean by scraping ; but the stone is very porous and absorbent, and would be kept much freer of organic matter by being occasionally washed with quick lime. Were this done, the walls might be scraped at intervals of time with advantage.

The library and reading-room occupy the same room. It requires ventilation by a shaft and two inlets for air. The grate should also be remodelled, to warm a portion of the admitted air.

There are two ablution-rooms ; one behind the infantry barracks, and the other at the east end of the cavalry range. They have ablution tables, with the water laid on ; but they have no gratings for the men to stand on, and no pegs. The ablution tables would be much improved by having a bead at the edge, to prevent the water dashing over upon the men ; and the ablution-houses themselves should have additional ventilation, by perforated panes in the windows.

There are no baths. One for every 100 men will be required.

There are two women's wash-houses, one for the infantry and another for the cavalry. They have boilers and washing tubs, but they have no means of drying or getting up linen. The wash-house belonging to the infantry barracks, requires additional light by glass slates in the roof. The cavalry wash-house should have a louvre in the roof for ventilation. Water should be laid on to the washing tubs, and one drying and laundry stove would probably be found sufficient for the two barracks.

There are two cook-houses for the infantry, and one for the cavalry. They are fitted up with boilers, but have no other means of cooking. A ventilated roasting oven should be put up in each cook-house. The cook-house at the end of the cavalry barracks should have a shaft through the ceiling, and perforated panes in the windows for ventilation.

A simple plan has been proposed by Colonel McMurdo for varying the cooking by stewing on a hot plate. We have authorized his making the trial, though of course this will not supersede the necessity of roasting ovens.

There is no covered drill-shed belonging to either barrack.

There are the usual workshops attached to each barrack, but the infantry tailors' shop, being too small, has been given up to a married non-commissioned officer, and an infantry soldiers' barrack-room has been misappropriated for a tailors' workshop.

Water for the barracks is derived from six tanks with filters attached to them, and six wells. Part of the roof water is also collected for use. The wells are very deep, and expend a large amount of labour in pumping. We are informed that horse-power is

about to be applied to this operation. If the whole roof water were collected, it would materially augment the disposable supply.

The barracks are drained by a sewer passing down the centre of the barrack square, and receiving smaller branch drains, the drainage being discharged on an adjoining field below the level of the barracks.

The fall is ample, and the drains are all reported effective, and properly trapped. Connected with one of these drains, behind the infantry barrack, are the privies of the range. The soil is received into the drain, and is flushed down the drain, and out of the barrack into a tank about 50 yards outside the boundary wall. The arrangement is a considerable improvement over the usual form of privy, but in this, as in all cases, no such expedients can compensate for the absence of water receptacles. We would recommend that these privies be reconstructed as water latrines, in which water shall stand between the times of flushing. All the other privies are connected with cesspits periodically emptied. These should be abolished, and water latrines, with divisions of seats, half-doors, light, and ventilation, should be provided for the whole barrack. All urinals should also be supplied with water.

We are informed that Mr. Herapath's deodorizing system by magnesian lime is about to be applied to the sewage.

Ventilation has been provided for in the construction of the cavalry stables. It is obtained by bringing in air through channels in the division walls, and admitting it under each manger. An outlet 9 inches by 6 is also provided for each stable. It is carried up in the chimney, and has openings over each stall. This outlet has not sufficient area to ventilate the stables, and prevent risk of the fumes passing into the rooms above, through the ceilings. We are of opinion that to do this properly it will be needful to carry up a shaft from each corner to above the roof of the buildings. The shaft should be lined with soldered zinc.

The provost cells are clean and well ventilated. There is an offensive privy and cesspit belonging to them, which ought to be abolished.

Ventilation is required in the guard-room by a shaft and inlet, and the grate should be remodelled to save heat.

The adjoining lock-up is very small and unhealthy. Another ought to be constructed with as little delay as possible.

There are no married quarters in these barracks. The want leads to misappropriation of barrack-rooms; and proper accommodation for married non-commissioned officers and soldiers is much required.

*The following are the Sanitary Improvements necessary for Horfield Barracks:—*

1. Reduction of numbers in the barrack-rooms of both cavalry and infantry barracks to the extent stated.

2. Ventilation of all the barrack-rooms by shafts and inlets, as described. Ventilation of the non-commissioned officers' rooms by silk flap ventilators in the chimneys. Ventilation of the staircases by perforated glass panes in the windows. Ventilation of the guard-room by a shaft and inlets. Ventilation of the library and reading-room by a shaft and inlets.

3. Ablution-houses to have a bead to the ablution tables; to have pegs and gratings, and additional ventilation by perforated panes in the windows. Baths, with water laid on, to be provided in the proportion of one bath to 100 men.

4. A laundry and drying stove to be provided for the women's wash-houses. Infantry wash-house to have additional light through the roof, and the cavalry wash-house to have a louvre in the roof for ventilation.

5. Cook-houses to be supplied with ventilated roasting ovens. Cavalry cook-house to be ventilated by a shaft and perforated panes.

6. All cesspits within the barrack enclosure to be abolished, and all the privies to be converted into water latrines, with divisions of seats, half-doors, light, and ventilation. Urinals to be supplied with water for cleansing.

7. The doors between the stables and the staircases in the cavalry barracks to be built up, and the stables to be ventilated by shafts carried from the corners to above the roof.

8. Barrack-room walls to be quicklime washed at the customary intervals of time, and only scraped occasionally.

*Horfield Barrack Hospital.*

This building is situated at the upper end of the barrack enclosure. It is two stories high, and contains seven wards, arranged somewhat peculiarly.

There is a wide passage and staircase, which traverses the building from front to back, and at right angles to this are two passages, right and left, on each story. The passages on the lower floor give admission to the kitchen, surgery, &c., and on the upper floor they give access to the wards. At the far end of each passage is a long ward running from the back to the front of the building, having two windows at each of the two opposite ends. Opening right and left from the passage are five small wards, with windows only on one side, so that the passage forms a sort of inner corridor connecting the wards, and without any direct light or ventilation. The whole hospital at the time we saw it was admirably clean.

The following table shows the ward accommodation in comparison with what it would be at 1,200 cubic feet per bed:—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 4 | 3 | 1 |
| 2 | 12 | 7 | 5 |
| 3 | 4 | 3 | 1 |
| 4 | 1 | 1 | — |
| 5 | 4 | 3 | 1 |
| 6 | 12 | 7 | 5 |
| 7 | 4 | 3 | 1 |
| Total - | 41 | 27 | 14 |

Several of the wards are so small that it is impracticable to give 1,200 cubic feet per bed, without leaving a very large remainder. We have, therefore, preferred leaving the additional bed in the ward to taking it out. In every ward, therefore, except No. 4, the amount of space we have allotted in the preceding table falls considerably short of 1,200 cubic feet per bed, and withal the present wards can only accommodate 27 beds. The wards are ventilated at present by Moore's louvred panes in the windows, but the number is quite insufficient, for although only about half the beds were occupied at the time of our inspection, the ward atmosphere was in an offensive state.

To remedy this we would propose to carry up one shaft from the ceiling of each ward to above the roof of the building, and to leave the present louvres as inlets. It will be necessary also to ventilate each passage by carrying a shaft from its ceiling near the door of the end ward to above the roof. Perforated panes should also be introduced into the stair windows. When this is done, a swing window placed over the door of each end ward will assist in improving the thorough ventilation of the building.

The wards are lighted by candles, ten candles per week being allowed for each ward. The light is described as very insufficient. If gas be brought to the barrack, it should certainly be introduced into the hospital, with a ventilating funnel and tube over each jet.

There is an ablution-room, but it has no proper fittings. It should have a slate table, with sunk basins, and hot and cold water laid on.

The bathing accommodation consists of an unnecessarily large iron bath and a shower bath. There is a copper and furnace, but no water is laid on, and every drop of water for the bath has to be carried from the pumps in the barrack square. A proper fixed bath should be provided, with hot and cold water laid on.

The hospital wash-house has tubs, but it has no drying stove, and no water laid on.

The arrangements for cooking are sufficient, but as the kitchen is under a ward, it requires a shaft carried up through the roof, and perforated panes for ventilation.

Water is not laid on at any part of the hospital, which is a great defect, and one requiring remedy.

There is no water-closet attached to the hospital ; there are three flushed privies in the back yards. These should be converted into proper water latrines, and a water-closet should be built behind the hospital, with an entrance from the staircase.

The pack store is described as being very damp, and quite unfit for keeping packs.

Probably a small stove placed in it would remedy this defect.

There is no accommodation for the sick of soldiers' families.

Behind the hospital is a deep undrained ash-pit, in a position where refuse ought not to be accumulated. This ash-pit should be done away with, and the hospital refuse removed to a greater distance.

*The following, then, are the Sanitary Improvements required:—*

1. Reducing the number of beds in each ward to the extent stated.

2. Ventilating each ward by a shaft from the ceiling to above the roof. Ventilating each passage by a shaft, and by perforated panes in the stair windows, and by placing a swing window over the door of each end ward. Ventilating the kitchen by a shaft and perforated panes.

3. Providing a proper fixed bath and ablution basins, with hot and cold water laid on.

4. To provide a water-closet entering from the staircase, and to substitute a proper water latrine for the existing flushed privies in the yard. Ash-pit to be abolished, and the hospital refuse to be collected and removed daily in an iron barrow or otherwise.

5. Laying on water, and providing a drying and laundry stove for the wash-house.

Sidney Herbert.
John Sutherland.
W. H. Burrell.
Douglas Galton.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission, February* 19, 1859.

---

## PLYMOUTH AND DEVONPORT.

Sir,

In conformity with our instructions we have inspected and made inquiry into the sanitary state of the following barracks and hospitals at Plymouth and Devonport, and we have now the honour to transmit to you our report respecting them.

The barracks and hospitals we have inspected in this district are as follows :—

Plymouth - 1. The Citadel.
2. Prince of Wales redoubt.
3. Maker barracks.
4. No. 6 redoubt.
5. Picklecombe Point.
6. St. Nicholas Island.

Devonport - 7. Raglan barracks (and married quarters).
8. New Artillery barracks.
9. Granby Infantry barracks.
10. Mount Wise barracks.
11. Bull Point barracks.
12. General hospital.

### 1. The Citadel.

The citadel is built on an angle of land projecting into Plymouth harbour. It covers about eight acres of ground, is considerably elevated above the water, and freely exposed to the sea breezes. The subsoil is rocky, and the natural facilities for drainage amply sufficient. The site is healthy, and well ventilated. Part of the buildings date as far back as 1670, but some are of more modern construction.

The officers' quarters are in a long two-story range of small low ceiled rooms, in many points affording very inadequate accommodation, and which would require reconstruction to make them what they ought to be.

The men's barrack accommodation consists of casemates, barrack-rooms, which have been formed out of an old store, called "The large barrack," and three ranges of buildings, known as the "Chaplain's range," "The fort-major's range," and "The governor's range." The casemates are immediately within the curtains, and the barrack ranges are built parallel to the curtains. The total accommodation within the citadel, according to present regulation, is for 1,180 non-commissioned officers and men.

The casemated barracks are of defective construction as regards health, and are in this respect far behind the new casemates in Dover citadel. They are low, dark, and not sufficiently ventilated. Most of them are between eight and nine feet high from the floor to the crown of the arch. The floors are covered with asphalt, a bad material for such a purpose. It is cold, never looks clean, and is very liable to have damp deposited on it. The floors should be boarded when repairs are next required. Each casemate has a door, and two windows at one end only. They have each one fireplace, and a shaft for ventilation carried up from the top of the end wall to the parapet above, where it is covered by a grating, but there are no inlets for air. The windows and doors of the casemates are arched inside, and square headed outside ; some additional light might be obtained by opening out the portion between the square head and the circular top, and filling the space with glass. The ventilation admits of easy improvement, by inserting a silk flap ventilator into the chimney of each casemate, as near the crown of the arch as possible. An inlet for fresh air ought to be at the same time provided, by making an opening through the wall over the door close to the top of the arch, and by providing a cornice of perforated zinc inside for diffusing the admitted air.

The rooms in the "large barrack" are constructed back to back, with two windows on one side and a dead wall on the opposite side. There are louvred openings through this wall, but they are of no use for ventilation. The rooms enter from each side of a staircase, passing right through the building. In the upper floors a serjeants' room is partitioned off from the staircase.

The rooms in "The large barrack" are tolerably good, but they require ventilation. For this purpose a shaft will have to be carried up from the ceiling of each room to above the roof, and two inlets for air, of the usual construction, will have to be made in the outer wall.

The staircase also requires ventilation by perforated panes of glass in the top sashes of the windows. Each serjeants' room should have a silk flap ventilator in the chimney close to the ceiling.

The rooms in "The chaplain's range" and "fort-major's range" are built back to back. They have windows on one side only, and a louvred opening

through the wall between the adjoining rooms. They have no means of ventilation. The rooms are not good —some of them are better than others, but there are rooms in the basement of the chaplain's range which are not fit for occupation, and which ought to be struck off the construction. All the other rooms ought to have shafts and inlets for ventilation. It was stated to us that it is under consideration to rebuild these ranges ; a very desirable measure, in our opinion, so far as concerns the health of the men.

The rooms in "The governor's range" are entered from a wide central staircase, out of which, on each flat, enters a large barrack-room to the front and two small ones at the sides. The upper rooms have no ceilings. All of these rooms require shafts and inlets for ventilation, and the staircase requires ventilation by perforated glass panes in the windows.

In all the barrack-rooms and casemates, with two or three exceptions, the amount of cubic space is considerably below what is required for health. The deficiency is shown in the following table, which exhibits the accommodation under existing regulation as contrasted with the amount available at 600 cubic feet per man :—

| Barrack Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |

| No. 97 - | 12 | 7 | 5 | 12 | 7 |
| Total - | 1,083 | 645 | 438 | — | — |

The deficiency of accommodation amounts to 40 per cent. There is room for no more than 645 men, instead of 1,083, the number on the present construction of the barracks.

To do away with this overcrowding, the basement rooms under the chaplain's range ought to be evacuated at once, and the necessary reductions made in the other barrack-rooms as soon as practicable.

The fire-grates in the barracks and casemates are of the old construction, and might be remodelled with advantage, to save heat.

All the barrack-rooms are lighted by candles. The canteen alone has gas, which was brought in at the expense of the canteen man. The gas costs 4*s*. per 1,000 cubic feet.

The barrack-rooms, casemates, school-rooms, and reading rooms ought to have ventilated gas-burners introduced into them.

There are no day-rooms, cleaning-rooms, or covered drill sheds.

There is one large school-room for 80 scholars. It is situated in the governor's range ; its ceiling is low, and there are windows only on one side. It requires ventilation by shafts and inlets, with perforated zinc cornices.

The girls' and infants' school-rooms are very small and crowded. They should be ventilated by shafts and inlets of the usual construction. The library also requires ventilation in a similar manner.

There are several ablution houses in different parts of the barracks. One, belonging to the casemates, is very small and narrow ; it has no pegs, and it would be somewhat improved by ventilation through the roof, The ablution house at the chaplain's range also requires ventilation and pegs. Similar improvements are needed for the ablution house in the governor's range.

Ventilation in both cases could be supplied by glass louvres in the windows.

There are no baths. A bath house, with one bath for every 100 men, should be erected in some convenient locality, and have water laid on.

There is no proper laundry. There is one good wash-house with boilers, but it has no fixed tubs and no drying stove. At the end of the chaplain's range in the basement is situated a gloomy unventilated wash-house, almost entirely below the level of the

ground. It has no fixed tubs, and no means of drying or getting up linen. It requires ventilation by a shaft 18 inches square, carried up from the ceiling to above the roof, and by perforated glass panes in the windows. This wash-house admits of very little improvement, but the one behind the "large barrack" has space in which a drying closet might be placed, where all the soldiers' linen could be dried. Both wash-houses should have fixed tubs and water laid on.

There are three cook-houses situated in the basement of the barrack ranges. They are dark and insufficiently ventilated, and have no roasting ovens. Each of them requires a shaft, at least one foot square per six boilers, carried up to above the roof of the barrack ranges, and perforated glass panes in the windows. There is one good cook-house behind the "large barrack." It has boilers, but no other means of cooking. All these kitchens require roasting ovens.

The only accommodation for pursuing trades consists of a tailor's and shoemaker's shop, besides the armourer's shop. All need ventilation through the roof by shafts and inlets for air.

The staff serjeant's quarters are unventilated. They require a silk flap ventilator into each chimney.

The guard-room requires inlets for air, and a silk flap ventilator into the chimney.

Water is supplied to the citadel from the mains of the Plymouth Water Company, but it is stated to be insufficient in amount, though the quantity might be increased by enlarging the main. The water from the roofs is also collected for use.

All the buildings are drained by earthenware pipes to the sea. The drains are stated to be all trapped, and none of them pass under any buildings.

There are several ash-pits behind the barrack ranges, which could be very easily dispensed with by simply removing the front wall, and placing an iron cart to receive the ashes, and in which they might be removed daily. This we recommend to be done.

The privies are in the curtains. They are drained to the sea, and have an apparatus for cleansing, which throws numerous jets of water over the floor and seats, but does not properly flush the troughs, and there is consequently considerable nuisance from them, which might be avoided by better arrangements.

Proper water latrines are required, with proper means of flushing, better ventilation, and divisions between the seats, and half-doors.

There are no married quarters in the citadel, and married people have to be accommodated in casemates or barrack-rooms. The casemates so occupied at the time of our inspection were crowded with women and children, and almost the whole floor space was covered with beds placed close to each other.

The canteen tap-rooms require silk flap ventilators into the chimneys, and perforated glass panes in the windows.

*We would recommend the following Improvements to be carried out in these Barracks:—*

1. The number of men in each casemate and barrack-room to be reduced to the extent stated, and the rooms in the basement of "the chaplain's range" to be evacuated and struck off the barrack-room construction.

2. Each casemate to have a silk flap ventilator placed in the chimney, and an inlet for air over the door. The inlet to be covered by a perforated zinc cornice for diffusing the air within the casemate.

The window space of all the casemates to be enlarged in the manner pointed out.

The floors to be boarded at the earliest opportunity.

3. Each barrack-room to be ventilated by one or by two shafts as the case may be, to afford the requisite sectional area per man, and each room to have two inlets for air covered by perforated zinc cornices close to the ceiling. All the staircases to be ventilated by perforated glass panes in the upper sash of each window.

The non-commissioned officers' rooms to be ventilated by silk flap ventilators into the chimneys.

The guard-room to be ventilated by inlets for air, and by a silk flap ventilator into the chimney.

The school-rooms and library to be ventilated by shafts and inlets.

The workshops to be ventilated by shafts and inlets.

The canteen rooms to be ventilated by silk flap ventilators, and by perforated panes in the windows.

All the barrack-room and casemate fire-grates to be remodelled, to save heat.

4. The casemates, barrack-rooms, library, and adult school-room to have ventilated gas-burners, and the gas-burners in the canteen tap-rooms to be ventilated.

5. Ablution houses to be ventilated, and to have pegs, as stated.

6. A bath house, with one bath for every 100 men, and water laid on, to be provided.

7. Wash-houses to be ventilated as described, and to have fixed tubs, and means of drying and getting up linen.

8. Cook-houses to be provided with ventilated roasting ovens. The cook-houses in the basement of the barrack ranges to be ventilated as described.

9. Ash-pits to be removed, and iron carts substituted.

10. The privies to he converted into water latrines, with divisions of seats and half-doors, and to have more ventilation.

Lastly, married quarters, day-rooms, and a drill shed are required.

*Citadel Temporary Hospital.*

The Hospital accommodation in the citadel consists of two small rooms, in one of which two sick are accommodated, and in the other three sick. They are intended merely as places to which a slight case or two of disease may be sent before being transferred to the general hospital at Devonport. The accommodation is otherwise quite unsuited for a hospital.

*We would recommend:—*

That the rooms be provided with a shaft and inlet each for ventilation.

2. The Prince of Wales Redoubt.

This is a small fort covering about half an acre of ground, in an isolated position, about 200 yards from the water in Plymouth Sound. It was erected in 1850, and has regulation accommodation for three officers and 76 men, including one serjeant and three servants. The men are barracked in four casemates, each 31 feet long, 20 feet 4 inches wide, and 13 feet 6 inches high. They open on a small inner court-yard, from which they are lighted by windows and doors. The casemates are of a very good height; they have air shafts and inlets, but the latter require perforated zinc covers of the usual construction, to prevent draughts. At present the men keep the covers of the inlets closed. These inlets are placed close to the outlet shafts instead of being at the opposite end of the casemate over the door, where they ought to have been. The casemates are otherwise very good.

The regulation number of men gives 472 cubic feet per man. The following is the accommodation:

| Rooms. | Total present Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 4 | 72 | 56 | 16 |

By reducing the inmates of each casemate from 18 to 14, each man of the remaining number would have as near as possible 600 cubic feet.

It is unfortunate that a better serjeant's room was not provided. The present one is off the kitchen, and very unsuitable. The kitchen, guard-room, and ablution-room are all gloomy.

The kitchen has no means of cooking, except boilers. A roasting oven is required.

Close to the kitchen is an ash-pit, situated on one side of the close inner court of the redoubt. It occupies space where space is needed, and it is better not to accumulate putrescent refuse in such localities; besides which it is quite unnecessary to do so. The whole kitchen refuse ought to be collected and removed out of the fort daily.

The privies are very defective in construction, and very offensive. They empty themselves into the sea, but are not supplied with water. They require to be reconstructed as water latrines. Macfarlane's apparatus would answer every purpose efficiently.

The drains are not trapped.

Water is derived from tanks within and without the fort, and the supply is stated to be sufficient.

*We would recommend for this Redoubt as follows:—*

1. Providing diffusers for the admitted air in the casemates.
2. A roasting oven to be supplied for the kitchen.
3. Re-construction of the privies as water latrines, with divisions of seats and half-doors.
4. Trapping all the drains.
5. Doing away with the ash-pit, and collecting and removing the refuse daily.

Lastly. At all ordinary times we are of opinion that the casemates ought to have no more than 14 men in each.

### 3. Maker Barrack.

This barrack is situated in an elevated and completely isolated position, overlooking the sea, about three miles south-west of Plymouth. It consists of a single range of two-story buildings erected across the gorge of an earthen redoubt. The officers' rooms are at one end of the building. The usual outhouses are separated from the barracks by a narrow court behind. The buildings face the south, and their local position is healthy.

Within the enclosure there is an area of about an acre in extent, having a rocky sub-soil. The structures are of stone and wood, and were undergoing repair and extension at the time of our visit.

There are in all two serjeants' rooms and nine men's rooms, with a total accommodation for 171 non-commissioned officers and men. The following table gives the details —

| Rooms. | Total Present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| No. 1, Lower - | 18 | 14 | 4 |
| „ 1, Upper - | 22 | 20 | 2 |
| „ 2, Lower - | 18 | 12 | 6 |
| „ 2, Upper - | 22 | 20 | 2 |
| „ 3, Lower - | 18 | 12 | 6 |
| „ 3, Upper - | 22 | 20 | 2 |
| „ 4, Lower - | 18 | 12 | 6 |
| „ 4, Upper - | 22 | 20 | 2 |
| „ 5 - - | 6 | 5 | 1 |
| Total - | 166 | 135 | 31 |

All the lower rooms are considerably over-crowded, according to the Schedule, and the largest proportion of men requires to be removed out of them.

In recommending the reductions in the preceding table, we have given considerably less than 600 cubic feet per man to the remaining inmates of the rooms, being guided in this, as in other similar cases, by the form of construction, and by the elevated, airy position of the barrack, as well as by its comparatively small number of inmates. It is necessary to state that our calculations as to the accommodation are based on returns sent us by the barrack master before the recent alterations were carried out. These alterations we saw in progress, and the improvements we are about to recommend have reference to the state of the barracks as we saw them.

For instance, no provision was being made for ventilating any of the barrack-rooms. To remedy this, we think it necessary that a ventilating shaft be carried up from the ceiling of each of the ground-floor rooms to above the roof, and that each room should have two inlets for air, with perforated zinc diffusing cornices of the usual construction. One of the inlets should be placed on each side of the room.

The upper rooms have no ceiling, but are carried up into the slope of the roof. In all these upper rooms we would recommend a louvred turret to be placed over the middle of the ridge, and two inlets for air, one on each side the room, to be provided close to the eaves.

The small six-men room will be sufficiently ventilated by a silk flap ventilator into the chimney, and by an inlet for air. Each of the serjeants' rooms requires a silk flap ventilator into the chimney; and the guard-room should have a similar ventilator and one inlet for air.

The fire-grates are of the old pattern, and might be remodelled with advantage.

The barrack is lighted with candles, and gas cannot be obtained.

There is no day-room, school-room, library, cleaning-room, drill shed, nor workshop. There is no place for married soldiers, except in the barrack-rooms.

The ablution room is dark. It is situated in a defensible tower at one corner of the barrack enclosure. It should have more light, if possible. One bath, with water laid on, is required.

The women's wash-house is very small. It is a mere shed, without any conveniences for washing. It requires a boiler, fixed tubs, and a drying stove. It should, in fact, be re-constructed and properly ventilated, and made fit for its purpose.

There is a cook-house in an old wooden building, with boilers set round a central shaft. It has no other means of cooking except boiling. The building requires re-construction in a more durable form, but in the mean time a ventilated roasting oven should be erected in it.

Water is derived from a well, and from the roof-water. It is stated to be insufficient in amount, but no doubt the supply admits of extension.

The barrack drainage is defective; and the drains, such as they are, are untrapped.

There is a very offensive privy connected with a drain, which conveys the fluid portion down the steep hill side, where it is utilized by farmers. The privy is only washed out ocasionally. We would propose that one of Macfarlane's water latrines be put up, in this instance, in lieu of the privy. It requires only a small quantity of water to keep it clean. It should have divisions of seats, and, if possible, half-doors. The outlet for the sewage already exists in this case. All the gulley grates should be trapped.

Close to the barrack is placed a large ash-pit for receiving and accumulating the barrack refuse. It should be removed, and the refuse taken to a short distance outside the works. It is quite unnecessary to have an ash-pit in such a situation.

There are several redoubts in the neighbourhood where Maker barrack is situated; and if they were all occupied there would be a considerable number of men living at a distance from any market. A canteen would, therefore, be a great convenience.

*The following are the Sanitary Improvements required in Maker Barrack:—*

1. Reduction of numbers as stated.
2. Ventilation of all the barrack-rooms, sergeants'

rooms, and guard-room, in the manner described, and re-modelling the firegrates.

3. One bath, with water laid on, to be provided.

4. Women's wash-house to be re-constructed, with boiler, tubs, drying stove, &c.

5. A roasting-oven to be provided for the cook-house.

6. Privies to be re-constructed, with a Macfarlane's latrine, and with divisions of seats, and half-doors. Gulley grates to be trapped.

7. Ash-pits to be done away with, and the barrack refuse removed daily out of the enclosure.

### 4. No. 6 Redoubt.

This is a purely defensive fort, with accommodation for 31 men. It is situated on the slope of the hill towards the sea, at a short distance below Maker barrack.

There are three barrack-rooms, one for 20 men and two for five men each. They are long, narrow, lofty, casemated rooms, closing the gorge of the redoubt. They have loopholes to the rear, and low windows towards the interior of the work. A portion of one of the third and lowest rooms has no windows, and the rooms are generally dark. All the rooms are defectively ventilated. To remedy this, the windows should be increased in height, and a large silk flap ventilator should be placed in each chimney. An inlet for air should also be made in the upper part of the end wall of the two rooms near the gate, at a distance from the chimney. The third and largest room is more difficult to ventilate, and it is the one which requires it most.

Besides a large silk flap ventilator for the chimney, two inlets for air, with perforated zinc cornices for diffusing the current, should be made as high up in the walls as possible.

The ablution-room requires a proper ablution table, with a bead along the edge, also gratings and pegs.

The cook-house has boilers, but no other means of cooking. It requires an oven, capable of roasting and baking meat.

The privy does not hold water. The fall for drainage from it is very steep. A water latrine, on Macfarlane's principle, should be substituted for the present arrangements, and the urinal should also be supplied with water.

The ash-pit is close to the cook-house. It would be very desirable in so confined an area, were it possible, to provide for the refuse being placed in a receptacle outside the enclosure.

The guard-room has loopholes along one wall, a window in another wall, a door opposite the loopholes, and an old pattern grate in the corner. The numerous openings would probably afford sufficient ventilation.

As this redoubt is intended simply for defensive purposes, and must contain its complement of men, it is not necessary to recommend any reduction of numbers. We have elsewhere expressed an opinion that casemates generally are not places in which soldiers should be barracked at ordinary times.

*We would simply recommend as follows :—*

1. That each casemate be ventilated by a large silk flap ventilator in the chimney. That each of the smaller casemates have one inlet for air, and the larger one two inlets.

2. That the ablution house be supplied with an ablution table.

3. That a roasting oven be put up in the kitchen.

4. That a Macfarlane's water latrine be substituted for the present privy, and the urinal be supplied with water.

5. That the ash-pit be removed outside the enclosure.

#### *Hospital.*

The hospital is a detached structure, in a lofty isolated airy situation, between Maker barrack and No. 6 redoubt, and is intended for the temporary reception of cases of illness occurring in these barracks.

It is built of wood, covered with slate externally, on a brick foundation, and consists of an E-shaped building, of which the wings are formed by two good wards connected by a passage, out of which open the surgery, orderlies' room, and kitchen.

The wards are of a tolerable size and have large windows. They have some ventilation in the ceiling, which might be easily rendered sufficient by a silk flap ventilator into the chimney. The fire-grates are of the old pattern, and should be remodelled. Each ward has regulation space for 12 beds, where hardly half that number ought to be. Certainly not more than seven beds ought to be allowed to each ward, and we would propose to reduce the accommodation to that extent, and to remove 10 beds out of the building.

The passage requires ventilation by perforated panes in the doors, and by a shaft, one foot square, carried through the roof.

The kitchen should have perforated panes in the upper sashes of the window.

Water is obtained from a spring at hand, and is laid on to the kitchen.

There is no water-closet, but there is a privy with cesspit in the back yard. The cesspit should be abolished, and the privy converted into a water-closet, and connected by a covered passage with the hospital, or a proper building for a water-closet should be erected.

Considering the temporary character of the building, we do not think it necessary to advise that much money should be expended on its improvement.

*We shall therefore limit our Recommendations to the following essential Points :—*

1. Reduction of the number of beds from 12 to 7 in each ward.

2. Ventilation of the wards, by a silk flap ventilator into the chimney. Ventilation of the kitchen by perforated panes, and ventilation of the passage by a shaft and perforated panes.

3. Providing a water-closet and abolishing the cesspit.

### 5. Picklecombe Fort.

This barrack and fort are situated on the western side of the entrance to Plymouth Sound, at a slight elevation above the sea. The area within the enclosure is about a third of an acre in extent, and the ground slopes rapidly from the hill behind to the fort, and from the latter to the sea. The barracks are built on a terrace above and behind the battery. They are two stories high, with a tower at each end. The lower story contains the ablution-rooms, kitchen, stores, &c., and the men's rooms are situated in the story above and in the eastern tower. The officers, quarters are in the western tower.

The barrack accommodation consists of nine soldiers' rooms, four of which are in the tower, and five are in the body of the buildings. The latter consist of casemated rooms, four of which are 36 feet long, and one, used as a barrack-serjeant's store, is 69 feet in length. The total accommodation is for 96 men, and the details are given in the following table :—

| Rooms. | Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 14 | 10 | 4 |
| 2 | 16 | 12 | 4 |
| 3 | 15 | 12 | 3 |
| 4 | 16 | 13 | 3 |
| 5 | 20 | 17 | 3 |
| 6 | 4 | 4 | — |
| 7 | 4 | 4 | — |
| 8 | 4 | 4 | — |
| 9 | 3 | 3 | — |
| | 96 | 79 | 17 |

Taking into account the isolated position of this barrack we do not consider it necessary to give 600 cubic feet per man, and the amount of healthy accommodation in the table, namely, that for 79 men, is calculated below 600 cubic feet per man.

To enable this to be done, however, the rooms must be well ventilated, no provision for which at present exists, although provision could have been easily made in the construction.

We would propose to remedy the defect as far as possible by placing large silk flap ventilators in each chimney, and by contracting the fireplace below by remodelled grates, to increase the draught through the ventilators; air should, at the same time, be admitted through the loopholes in rear (which have double windows) by putting a perforated pane in each sash in every third loophole.

The turret barrack room should have a perforated pane as near as possible to the top of each window, and a silk flap ventilator in the chimney.

The long barrack-room, in addition to the ventilators in the chimney, will require a hollow beam with a wooden bottom, perforated zinc sides, and a division across the middle, to be carried through the outer walls, and across the middle of the room at the ceiling, to communicate with the air on both sides, the sectional area of the beam being about 12 square inches per man.

Water is derived from the hill behind the fort, and is received into a tank capable of holding 3,700 gallons. The well holds 1,800 gallons. The supply is stated to be deficient in September and October. It is worthy of consideration how far this could be remedied by making a tank (to be filled at other times of the year) capable of containing sufficient water for the dry season.

The privy is situated in an angle of the platform. It is dark and unventilated, and requires light and ventilation through the roof, divisions of seats, and half-doors. At present it is drained to the sea, but is not supplied with water. It should be converted into a water latrine.

The cook-house is under the barrack-rooms. It should have a shaft carried up to above the roof, if there is space for such a shaft in the tower containing the chimneys, and perforated panes should be placed in the windows. At present the only means of cooking are boilers of the usual form. An oven capable of roasting and baking meat is required.

The ablution-room should be ventilated by perforated panes in the window. Pegs, and a bead to the table are also needed.

There is no bath. One is required, with water laid on.

These barracks were built in 1848, but they were not occupied at the time we inspected them. They are unprovided with many of the conveniences which would be desirable were they intended for permanent occupation by troops. One point in their structure has been brought under our notice as giving rise to discomfort to the men, namely, that the large barrack-rooms enter the one from the other, and have no separate entrances. Amongst other deficiencies there is no place where linen can be washed.

*The following Sanitary Improvements ought to be carried out in these Barracks :—*

1. The numbers in the rooms at ordinary times should be reduced to the extent stated.
2. All the rooms to be ventilated as recommended.
3. The privy to be converted into a water latrine, with divisions of seats, half-doors, light, and ventilation.
4. Ablution house to have pegs, and one bath, with water laid on.
5. Cook-house to be ventilated, and provided with a roasting oven.

### 6. St. Nicholas Island Barracks.

St. Nicholas Island lies in Plymouth Sound. The fort on it contains barracks for 130 men.

The barrack enclosure is about an acre in area. The buildings are old, and by no means well adapted for their present purpose.

The rooms are built back to back, and are entered by a passage through the building, from which a staircase leads to the upper floor.

Each room has only one window, and the fireplace, with a grate of the old pattern, is opposite the door.

The back rooms are very dark, and external circulation of air is much interfered with by the too close proximity of buildings in the rear.

The deficiency of light should be remedied as far as practicable by opening additional windows in the end rooms, while all the other windows should if possible be enlarged.

The rooms are very much overcrowded, and we are of opinion that, taking into consideration the defective construction of the barrack buildings, 600 cubic feet should as nearly as possible be allotted to each inmate, notwithstanding the apparent favourable position of the fort for health.

The following table shows the accommodation as it is and as it ought to be :—

| Rooms. | Present Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 8 | 5 | 3 |
| 2 | 8 | 5 | 3 |
| 3 | 9 | 6 | 3 |
| 4 | 8 | 4 | 4 |
| 5 | 8 | 5 | 3 |
| 6 | 8 | 5 | 3 |
| 7 | 8 | 5 | 3 |
| 8 | 8 | 5 | 3 |
| 9 | 8 | 4 | 4 |
| 10 | 8 | 4 | 4 |
| 11 | 8 | 4 | 4 |
| 12 | 8 | 4 | 4 |
| 13 | 8 | 4 | 4 |
| 14 | 8 | 5 | 3 |
| 15 | 8 | 4 | 4 |
| 16 | 9 | 6 | 3 |
| Total - | 130 | 75 | 55 |

The rooms will not divide equally into cubic spaces of 600 feet; we have given rather less than that amount, and find that 75 men is the maximum number the rooms ought to contain.

Notwithstanding the overcrowding shown in the above table none of the rooms are ventilated. To remedy this defect each room should have a shaft carried up from the ceiling to above the roof close to the back wall, and an inlet for air over the window.

The passages should also be ventilated by a shaft through the ceiling, and by perforated panes in the upper sash of the back window, and of the window over the door. By adopting these means a circulation of air will be provided for throughout the building.

The master gunner's quarter is under the tap room of the canteen and next to the lock-up room. It is small and unventilated, and hardly fit for occupation by such an officer. It would be very desirable to provide him with a proper quarter in a less objectionable situation.

The ablution-room is situated behind the barrack range. It requires pegs, and a bath, with water laid on, if a sufficiency of water can be obtained.

The cook-house is imperfectly ventilated, and it has only boilers for cooking. It should have a louvre in the roof, perforated panes in the windows, and an oven to roast and bake meat.

The urinal and dust heap are in front of the barrack-rooms, but on a lower level; they are complained of as giving rise to nuisance, especially in warm weather. No accumulation of decomposing refuse should be permitted within so limited an area; and besides, it is

not necessary, for refuse could be thrown down a shoot into a covered receptacle near the water's edge, whence it could be removed by the contractor.

There is no day-room nor school-room. There is, however, a library.

There is no women's wash-house, no cleaning-room, nor workshop. There is no separate accommodation or mess-room for non-commissioned officers, and there are no married quarters.

The water supply is defective, and water has to be carried in barrels from the Royal Victualling Yard.

The privies have only three seats. They have no divisions of seats, no light, and no ventilation, and although they are drained they give rise to nuisance. It would be very desirable, provided even waste water could be obtained, to reconstruct them as water latrines, on Macfarlane's principle, with proper divisions of seats, half-doors, and adequate light and ventilation.

The canteen tap-room requires a silk flap ventilator in the chimney.

A proper provision store is also needed for the canteen man, who, for want of a store, has to keep the provisions in his own living room.

It will be seen that the barrack accommodation in Fort St. Nicholas is very imperfect and inconvenient. It is not for us to say to what extent it is possible to increase it. We simply record the facts, and confine ourselves to recommending those sanitary improvements which are necessary and practicable with the existing buildings.

*They are as follow :—*

1. Reduction of numbers of men in the barrack-rooms to give 600 cubic feet each.
2. Ventilation of each barrack-room by a shaft and inlet of the usual form. Ventilation of the passages and staircases by a shaft through the ceiling, and perforated glass panes in the windows. Canteen tap to have a silk flap ventilator in the chimney.
3. The ablution-room to have pegs, and one fixed bath, if water can be obtained.
4. Cook-house to have a roasting oven provided, and to be ventilated by a louvre in the roof and perforated glass panes in the windows.
5. Dust heap to be done away with.
6. Privies to be reconstructed, with water receptacles, divisions, half-doors, light, and ventilation.

*Hospital St. Nicholas Island.*

The hospital consists of one ward up a flight of stairs. It is at present used as a reading-room and school-room.

The surgery is down stairs next to the kitchen.

The accommodation is only of a temporary character, until cases of sickness can be removed to the general hospital. In other respects it is quite unfit for the reception of serious cases of illness. The ward is not ventilated, and should have a shaft and inlet for air, and a remodelled grate. The kitchen should be supplied with a range containing an oven, instead of the ordinary barrack grate at present in use. It also needs ventilation by a shaft through the roof and by a perforated pane in each window.

*The requirements for this Hospital are therefore :—*

1. A shaft and inlet for ventilating the sick ward.
2. A shaft and perforated panes for ventilating the kitchen, and a new cooking range.

### 7. Raglan Barracks.

These are large new barracks, the south wing of which only was completed and occupied at the time of our inspection. They are enclosed within an area of 10A. 3R. 35P., adjoining the town population of Devonport, and near the shores of the Hamoaze.

The buildings are arranged in blocks on three sides of a parallelogram. The officers' quarters are situated at the two ends. The men's quarters are in two blocks, with a detached central building for staff officers' quarters, non-commissioned officers' mess establishment, library, &c., the whole forming a long line of building facing the provost establishment and the main guard. Behind the central line of soldiers' quarters are situated the canteen, cook-houses, privies, urinals, &c.

The buildings are of handsome appearance, and their general arrangement is well adapted for external ventilation and for health ; but, as willpresently be shown, there are defects in the internal construction, some of which admit of removal, and which might be removed with great advantage to the healthiness of the barrack-rooms. The other defects do not admit of remedy.

Each of the barrack-room ranges consists of two slightly projecting wings three stories high, connected by a long central part two stories high, along the face of which an open verandah is carried.

The rooms in the projecting wings differ in construction from those in the centre of the blocks.

The former are entered from the end by spacious stone staircases and landings. Each landing gives access to four rooms, two on each side. These rooms are all within the wings. But there is another room entering from the end of the passage, which is situated in the central portion of the range. One consequence of the form of construction adopted in the wings is, that the rooms are deficient in window space, and that the end nearest the door forms a deep gloomy recess, without sufficient light or means of ventilation.

The rooms vary in dimensions. Eight rooms are 43 feet long, 23 feet 3 inches wide, and 11 feet 6 inches high. Eight rooms are 42 feet 4 inches long, 22 feet 7½ inches wide, and 11 feet 8 inches high. Eight rooms, of the same length and breadth as these last, are 12 feet 6 inches high. Nine rooms are 45 feet 9 inches by 20 feet, and 12 feet high, and other nine rooms are of the same length and breadth, and 12 feet 6 inches high.

For all practical purposes, the length of each room may be taken as indicating the distance between the opposite windows, and the facilities for light and ventilation.

In a number of the rooms there are dark spaces without windows, and in all cases the distance between the windows at the opposite ends of the rooms is about double what it ought to be.

The rooms situated in the two-story central building are reached by broad passages and staircases passing through the ranges, and these rooms have windows at the two opposite ends, back and front. They are consequently better adapted for barrack-rooms than those in the wings, but they resemble corridors ; the distance between the opposite windows being much too great to afford sufficient light to the rooms. The windows are in fact placed at the ends of the rooms instead of along the sides, which latter is the arrangement usually adopted in the best constructed barracks. An additional window should, if possible, be opened in the darkest rooms in the wings.

A serjeant's berth occupies one of the barrack-room windows. On the upper-floor, the end of the passage is occupied by a non-commissioned officers' room, partitioned off from the staircase. These rooms require ventilation by a silk flap ventilator into the chimney.

The roofs are flat, and are covered with asphalt resting on iron plates. Formerly each upper room was open to the roof, but the condensation of moisture on the iron rendered it necessary to add a ceiling perforated with holes. These holes are at present of no use for ventilation, because the roof is air-tight.

None of the barrack-rooms have sufficient means of ventilation, and we were informed that the atmosphere in them at night, especially in the rooms in the wings, is very offensive.

There are Arnott's ventilators in the chimneys, but the opening of the fireplace is too large to enable them to act efficiently ; besides which, their area is much too small to make any material difference in the air of the rooms. Each room will require two foul-air shafts carried from the ceiling above the roof. One of these shafts should be placed in the dark corner of each room in the wings, and the other opposite the side windows. There should be two inlets for air also, covered with perforated zinc cornices made in the walls close to the ceiling of each room.

The two-story barrack-rooms also require two inlets, one at each end, between the windows, and two air shafts on opposite sides of the room towards its middle. The air shafts for the top rooms, with the perforated ceilings, might be simply a louvre of sufficient area carried up through the iron and asphalt roof.

Each staircase requires ventilation by a louvre through the ceiling and roof, and by perforated glass panes in the windows.

The amount of space per man allotted in this barrack is on an average under 500 cubic feet, but the average is an improvement on that hitherto allowed by regulation.

The following table shows what would be the total amount of accommodation at 600 cubic feet per man :—

| Rooms. | Total present Accommodation in Men. | Total Accommodation at 600 Cubic Feet per man. | Deficiency of Accommodation in men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 8 | 184 | 160 | 24 | 23 | 20 |
| 8 | 176 | 136 | 40 | 22 | 17 |
| 8 | 184 | 160 | 24 | 23 | 20 |
| 9 | 207 | 171 | 36 | 23 | 19 |
| 9 | 207 | 171 | 36 | 23 | 19 |
| Total - | 958 | 798 | 160 | — | — |

The excess of men per room over the number which would give somewhat less than 600 cubic feet is as follows :—In the first and third series of eight rooms the excess is three ; in the second eight rooms it is five ; and in each of the two series of nine the excess is four men per room.

All the rooms are warmed by fire-grates of the old pattern. Remodelled grates would save a large part of the fuel.

The rooms are lighted with gas, but the burners are not ventilated. A ventilating funnel and a tube should be carried from over each burner into the chimney, or into the nearest ventilating shaft.

There is no day-room for the men. There are two ablution-rooms in the completed part of the barrack, one under the end wing of the occupied range, and the other behind the range. They require pegs to hang the men's clothes on while washing. These rooms are rather dark.

There are no baths. A bath-house, with one bath to every 100 men, and water laid on, should be provided.

There are two cook-houses, with ten regulation pattern boilers in each ; but no other means of cooking. Each cook-house requires a ventilated roasting oven. The chimneys of one cook-house are in the ball court wall, and blacken it. This should be remedied. There are no cleaning-rooms or drill shed. There are no workshops, except an armourer's shop. The water supply is derived from the water company. It is good and abundant. The roof water is also collected for use.

The sewage is carried away by glazed earthen pipes, and the drains are stated to be all trapped.

The latrines are constructed with arrangements for flushing, but a very small and insufficient quantity of water remains permanently in the trough. The whole were offensive, and are stated to be very much so in warm weather. The building itself is too dark, and the divisions between the seats too low.

We are of opinion that these latrines should be re-constructed, so as to hold water at all times, besides having flushing arrangements. Macfarlane's latrine, such as has been adopted in the married quarters belonging to Raglan barrack, would answer the purpose, but in any case there ought to be a water receptacle. There should be proper divisions between the seats, and if there is space there should be half-doors put up, and additional light and ventilation provided in the roof.

The urinals have no water. A perforated water pipe for washing them out should be provided.

The ash-pits are too deep, and not properly drained. They are otherwise open to the objection arising from the accumulation of decaying matter near inhabited rooms. It would be better to do away with them altogether, and to substitute iron carts, in which to collect and remove the refuse every day.

The canteen is a large commodious building, but the tap-room is too dark. It has an air shaft for ventilation, and requires inlets at the ends like those recommended for the barrack-rooms.

The guard-room requires ventilation, by a silk flap ventilator into the chimney, and by an inlet for air.

The provost-establishment is stated to be deficient in proper provost-serjeant's quarters. There is only one room with an ordinary pattern grate for cooking the prisoners' food, and there is no ablution-room, nor place for the prisoners' bedding on those nights when they are not allowed bedding in their cells.

*The Sanitary Improvements required for Raglan Barracks are the following :—*

1. Ventilation of all the barrack-rooms by shafts and inlets for air ; ventilation of the staircases by louvres through the roof and perforated glass panes in the windows ; ventilation of the non-commissioned officers' rooms by silk flap ventilators in the chimneys ; ventilation of the guard-room by a silk flap ventilator and inlet ; ventilation of the serjeants' mess-room and of the library by two inlets for air ; ventilation of the staff-sergeant's quarters by silk flap ventilators ; ventilation of the canteen tap-room by two inlets for air. Each gas-burner to be ventilated.

2. Reduction of numbers of men in the barrack-rooms to the extent stated.

3. Baths to be provided in the proportion of one bath to 100 men, and pegs to be put up in the ablution-houses.

4. A ventilated roasting oven to be put up in each cook-house.

5. Latrines to have water tanks so that water may stand in them, to have better divisions of seats, and, if possible, half-doors ; also to be provided with additional light and ventilation through the roof. Urinals to be supplied with water.

6. Ash-pits to be removed, and iron carts to be substituted for collecting and taking away the barrack refuse.

*Raglan Barracks.—Married Quarters.*

This is a fine establishment, recently completed, and consists of 100 quarters for married non-commissioned officers and soldiers, so arranged as to form three sides of a square, the fourth side being completed by the cook-houses, laundries, &c. The consideration which has evidently been bestowed on the details of these buildings is most creditable to the gentleman who designed them.

Each married non-commissioned officer has two rooms, and each soldier has one room. The cubic contents of the rooms vary from 1,500 to 1,600 feet, certainly the minimum which ought to be allowed. The building is two stories in height, the upper story in each block being reached by a wide central staircase. A corridor extends the whole length of each flat, and the rooms open right and left out of the corridor. This arrangement should be avoided in future plans. The windows of the rooms are opposite the doors, and a complaint was made that the relative position of the door and window does not give sufficient space for the bed. The upper corridors are lighted by windows only at the ends, and the lower by doors. The light is deficient, and the ventilation of the corridors not very good, although provision has been made for it in the construction. It would very much improve the ventilation of all the corridors to put panes of perforated glass in the upper sashes of the end windows, and to carry a large louvre from the ceiling of each staircase above the roof of the building. The lighting should also be improved by skylights in the roof of the upper corridors, and by slabs of rough glass placed in the floor under the skylights, to admit light to the lower corridors.

Each quarter contains a small Devonshire cooking range.

None of the rooms are sufficiently ventilated. Each room should have a silk flap ventilator in the chimney.

A covered verandah is carried round the interior of the court. It leans against the wall of the buildings above the lower range of windows, so as to darken all the lower rooms on that side. This might be easily remedied by making the roof of the verandah over each window of rough plate glass.

The wash-house is rather dark. It should have a skylight in the roof, and the drying-room should be similarly lighted. Complaint was made of the inefficient action of the drying stove, but it appeared it had been fed with coke instead of coal. There is no ironing-room, but one of the cook-houses might be used for this purpose, as the women prefer cooking in their own rooms, and the cook-houses are not used. The ironing-room should have an access to the drying-room. The other cook-house might be converted into a bath-room for the women and children.

The ash-pit should be done away with, and an iron cart substituted, to be removed daily in connexion with the carts in Raglan barrack.

There is a very good and efficient arrangement of Macfarlane's water latrines and urinals, which, however, would be much improved by proper divisions and half-doors.

Notwithstanding the advantages of these quarters, we are of opinion that the plan adopted in the married quarters at Preston, described in our report on Preston barracks, is decidedly to be preferred. Better plans may yet be contrived, but the Preston plan is the best we have yet seen.

*We would recommend :—*

1. That the improvements in the lighting and ventilation of the corridors and quarters which we have suggested be carried out.
2. That the cook-houses be adapted for an ironing room and bath-room.
3. That an iron cart be substituted for the ash-pit.
4. That light be admitted to the lower rooms through the roof of the verandah, as described.

### 8. New Artillery Barracks.

The new artillery barracks adjoin the town of Devonport, and are constructed to contain one battery. They consist of two principal blocks parallel to each other, with a parade ground between them, of which one block contains the officers' quarters, and the other the men's rooms over the stables.

The guard-house, orderly-room, and cells stand near the gate, and behind the men's quarters are outbuildings, cook-house, workshops, infirmary stables, &c.

The area within the barrack enclosure is 2A. 1R. 21P. in extent. The subsoil is rocky ; all the buildings are of brick, and were erected in 1846.

The accommodation is for 152 non-commissioned officers and men. It is stated to be insufficient, as the batteries have been increased in size since the barracks were built.

The stables are constructed for 16 horses each, eight horses on either side, with a central passage between, from the front of the building to the back. The stables have not sufficient light. They are ventilated by an opening to the outer air at each upper corner, and a flue is carried from front to back in the lower part of the wall, with openings under each manger to act as inlets. This ventilation is not sufficient, more especially as the men's rooms are over the stables, and shafts should be carried up at each corner through the ceiling and through the men's rooms to above the roof. The total sectional area of these shafts should be at least 12 square inches per horse.

The men's rooms are entered by a passage and staircase near each end of the building. Each staircase gives access to two large rooms and a serjeant's room between ; and in each staircase is placed an open water tank under the same roof. This arrangement is not a good one, because its tendency is to keep the air within the barrack-rooms loaded with moisture. We would recommend that each cistern be provided with a close-fitting cover.

There are six men's rooms, with regulation accommodation for 24 men per room. They were occupied at the time of our inspection by 25 men each, with a cubic space rather above 600 cubic feet per man. The rooms are large, light, and airy, and are open to the roof. They have six windows, three on each side, and they are among the very few barrack-rooms we have seen in which the cubic space is sufficient for the health and comfort of the men.

There are no special provisions for ventilation, but this defect could be easily and inexpensively supplied by a louvre in the centre of the ridge of the roof, and by two inlets for air of the usual form, one at each end of the room between the windows near the eaves.

The fire-grates are of the old pattern, and should be remodelled, to warm part of the admitted air.

The ventilation of the staircases should be improved by perforated panes in the upper part of the sashes.

The serjeants' rooms are not ventilated ; they should have a silk flap ventilator in the chimney.

The sashes of all the rooms should be made to open top and bottom.

There are four ablution-rooms in the passages below the serjeants' rooms ; they are small, and their position is not a good one, unless there were an entrance separate from the staircase. Without this, the large, wet, evaporating surface usually existing in an ablution house unnecessarily increases the dampness of the air in the men's rooms. There are no baths. Two are required, with water laid on.

The cook-house has four boilers ; but it has no other means of cooking ; it is unventilated. An oven for baking and roasting meat should be provided, and a louvre should be placed in the roof, together with some perforated glass panes in the windows.

The forge, which adjoins the cook-house, also wants ventilation in the roof.

The privies are similar in construction to those in the Raglan barracks, and are flushed with rain water, They should be remodelled so as to have a sufficiency of water always standing in them ; they should have proper divisions of seats, and, if possible, half-doors, and much more light through the roof.

The urinals should be supplied with water.

There are too many nuisances in these barracks in the shape of manure-pits and ash-pits, some of which are not paved or drained, and are far too deep. An iron cart should be substituted for the ash-pits. There should be one manure heap placed in the most convenient situation for removal, and, if necessary, the stables most distant from it should be furnished with a deep barrow, in which to convey the manure.

There are no litter sheds, the litter being spread, in fine weather, outside the stable-door under the barrack-room windows. Sheds should be erected against the opposite boundary wall.

In the front of the stables near the parade ground stand the troughs for watering horses, which are supported on stone pillars placed in the centre of the gutters, so as to dam them up. This defect requires remedy.

The guard-room is defectively ventilated, and should have a silk flap ventilator in the chimney, and an inlet for air of the usual construction.

The passage which separates the guard-room from the cells should have two perforated glass panes in the upper sash of the window.

The barrack is lighted by candles. Gas can be obtained, and two ventilated gas-burners should be introduced into each barrack-room.

This barrack is deficient in day-rooms, schoolroom, library, laundry, cleaning-shed, and drill shed, and there is no accommodation for married soldiers.

The soldiers' rooms require shelves or cupboards for food and articles of messing.

*The following are the Sanitary Improvements required :—*

1. Ventilation of each barrack-room by a louvred shaft through the ridge, and by two inlets with perforated zinc cornices for diffusing the air. Ventilation of the staircases and lavatories by perforated glass panes in the windows, and the water cisterns in the staircases to have covers provided.

Ventilation of the non-commissioned officers' rooms by silk flap ventilators in the chimneys.

Ventilation of the guard-room by a shaft and inlet, and of the passage to the cells by perforated glass panes in the windows. Ventilation of the cook-house and of the workshops by louvres through the roof.

2. Ventilation of each stable by four shafts carried up from the corner as described.

3. Two baths to be provided with water laid on.

4. A ventilated roasting oven to be put up in the cook-house.

5. Latrines to be reconstructed, with water tanks, and to have divisions of seats, additional light through the roof, and, if possible, half-doors. Urinals to be supplied with water for cleansing.

6. Ash-pit to be removed, and an iron cart substituted. Manure heap to be better placed for removal. Litter sheds are also required.

7. Barrack-rooms to be lighted with ventilated gas-burners.

### 9. Granby Infantry Barrack.

This is a small barrack, with regulation accommodation for 146 non-commissioned officers and men. It is situated close to the town of Devonport, within an area of 2 roods 22 poles in extent. The subsoil is rocky ; the buildings are of stone, and were constructed partly in 1809, partly in 1817. They consist of two portions ; one the barrack proper, and the other a building which was formerly the ordnance hospital. Both are occupied by troops. There are in all 10 soldiers' rooms and two serjeants' rooms ; the latter being occupied by one man each. The following table gives the accommodation in the men's rooms in comparison with what it would it be at 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| Nos. 3, 4 - | 30 | 22 | 8 | 15 | 11 |
| „ 5, 6 - | 32 | 20 | 12 | 16 | 10 |
| „ 7, 8 - | 28 | 20 | 8 | 14 | 10 |
| „ 9, 11 - | 28 | 20 | 8 | 14 | 10 |
| No. 10 - - | 12 | 8 | 4 | 12 | 8 |
| „ 12 - - | 14 | 9 | 5 | 14 | 9 |
| Total - | 144 | 99 | 45 | — | — |

The total accommodation, as nearly as may be, at 600 cubic feet per man, is sufficient for 99 men. The rooms differ very much in the two parts of the barrack. Those in the barrack proper are two stories high, and are reached by a passage and staircase boarded off from the rooms, thus depriving the rooms of the light of one window. The consequence is, that these rooms are gloomy and badly ventilated. They have a window at each end, but one of the rooms for 12 men has only one window.

The rooms in the old hospital are reached by a wide central staircase. They are nearly two feet higher than the rooms in the barrack, and they are well lighted. There is not, however, sufficient provision for ventilation, and we would recommend that each room, both in the barrack and hospital part, should have an air shaft carried up from the ceiling to above the roof, and that each room be also provided with two inlets for air, one at either end, with perforated zinc cornices for diffusing the currents.

More light should be given to the rooms in the barrack proper, by making a window through the partition which divides the passage and staircase from the barrack-room, so as to regain the use of the outer window. The staircase should be ventilated by perforated glass panes in the upper sashes of the stair windows. The serjeants' rooms also require ventilation by silk flap ventilators in the chimney.

All the fireplaces are fitted up with the old pattern grate, wasting a great deal of fuel which might be saved by remodelling the grates.

The barrack-rooms are lighted by candles ; gas can be procured, and a ventilated gas-burner should be introduced into each barrack-room.

There is only one ablution-room, which is too small, and too far removed from part of the barrack. The ablution table requires a ledge round it to prevent the water dashing over upon the men. The ablution house has no pegs, and it is defectively lighted and ventilated. It would be improved by glass slates in the roof, and by perforated glass panes in the windows, but being too small and there being no place for baths, it would be advisable in providing a bath-house with a bath, to increase the ablution accommodation under the same roof.

There are two cook-houses, with three boilers each, but there are no other means of roasting meat. Each cook-house should have a ventilated roasting oven, and more light and ventilation through the roof. There is a women's wash-house with a boiler, but it has no other accommodation for washing or getting up linen. It should be provided with fixed tubs having water laid on, and should have more ventilation through the roof, and perforated panes in the windows. It should also have a drying and laundry stove.

There is a good supply of water obtained from the water company and from wells.

The officers' privy empties into a cesspit, which ought to be abolished, and a properly drained water-closet substituted. The men's latrines are drained and flushed, but water does not stand in them, and they are very offensive in consequence. A latrine with a water tank on Macfarlane's principle, with divisions of seats and half-doors, ought to be substituted, and the building should have more light and ventilation. The urinals also require reconstruction, with water laid on for cleansing.

There is an ash-pit close to the men's rooms, which ought to be removed, and an iron cart substituted for collecting and taking away the refuse, in combination with a similar arrangement for the Royal Artillery barracks.

Granby infantry barrack is deficient in the following accommodation :—day-room, school-room, library, married quarters, cleaning-room, workshops, and non-commissioned officers' rooms and mess.

The guard-room is small and defectively ventilated. A new one is provided for in the annual estimates, and when it is built, the present guard-room would answer the purpose of an additional ablution-room and bath-room.

*The Sanitary Improvements required are as follow :—*

1. Reduction of numbers in the barrack-rooms to the extent specified.

2. Ventilation of every barrack-room by a shaft and two inlets for air. Opening an additional window to each room in the barrack proper. Ventilating the staircases by perforated panes in the windows. Remodelling the barrack-room grates, to warm part of the admitted air. Ventilating the serjeant's room by silk flap ventilators in the chimneys.

3. A ventilated gas-burner to be introduced into each barrack-room.

4. The present ablution-room to be improved by additional light through the roof ; ventilation by perforated glass panes ; pegs on the walls ; and by a ledge to the ablution table. An additional ablution-

room to be built, with accommodation for one fixed bath, or the present guard-room to be fitted up for the purpose.

5. Cook-houses to be provided with ventilated roasting ovens, and with additional light and ventilation through the roof.

6. Women's wash-house to have fixed tubs, with water laid on, a drying and laundry stove, and additional ventilation.

7. Officers' privy to be drained, and the cesspit abolished. Men's privies to be reconstructed as water latrines, with division of seats, half-doors, light, and ventilation. Urinals to be reconstructed and supplied with water.

8. Ash-pit to be abolished, and arrangements to be made for daily removal of the barrack refuse.

### 10. Mount Wise Barracks.

These barracks consist of a number of small detached blocks of stone building, constructed originally as an ordnance laboratory, but now used as barracks for artillery. They stand on the slope of a hill towards the Hamoaze, and occupy an area 1A. 3R. 4P. in extent. Some of the buildings are single cubes of one story, but the majority of the men's rooms are in long buildings, some one, some two stories high. They are arranged in two parallel lines, with a parade ground between them, and the outhouses are situated along the bonndary wall behind one of the ranges. There are five non-commissioned officers' rooms and 15 men's rooms. The total regulation accommodation is for five non-commissioned officers and 257 men.

The men's rooms differ considerably in size, and the amount of cubic space allowed in the rooms also varies.

The accommodation in each room is given in the following table :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| Nos. 16, 27 - | 46 | 30 | 16 | 23 | 15 |
| „ 17, 28 - | 42 | 40 | 2 | 21 | 20 |
| „ 19, 22, 26 | 27 | 24 | 3 | 9 | 8 |
| „ 20, 21 - | 50 | 38 | 12 | 25 | 19 |
| „ 23, 25 - | 24 | 18 | 6 | 12 | 9 |
| No. 30 - | 12 | 9 | 3 | 12 | 9 |
| Nos. 31, 33 - | 32 | 32 | – | 32 | 32 |
| No. 32 - | 24 | 23 | 1 | 24 | 23 |
| Total - | 257 | 214 | 43 | — | — |

From the circumstance of these barracks being constructed in detached blocks we have in the preceding table allowed rather less than 600 cubic feet in calculating the accommodation. The excess of occupants of the rooms is, however, 43.

With the exception of rooms 20, 21, 31, 32, 33, all are very deficient in light and window space, and this defect is one of the first that ought to be supplied. Additional windows should, wherever practicable, be placed on the opposite sides of the rooms, to admit of thorough ventilation by opening all the windows; but if from any circumstance this cannot be done, a sufficient number of skylights made to open should be introduced in the roof. All the windows should be made to draw down at the top. None of the rooms are ventilated.

In supplying this defect the following principles require to be kept in view. In all the rooms which are not ceiled ventilation by louvred turrets in the ridge should be adopted. In the longer rooms two of these turrets should be introduced, and in the short rooms one will be sufficient. In all the ceiled rooms ventilating shafts should be carried from the ceiling to above the roof. The larger rooms will require two of these shafts, and the shorter rooms one. Each room will require inlets covered with perforated zinc diffusing cornices placed close to the ceiling or eaves. The longer rooms will require four such inlets and the shorter rooms two. The same method of ventilation requires to be introduced into the guard-room, library, school-room, and workshops. The guard-room also requires additional light The serjeants' quarters need ventilation by a silk flap ventilator into the chimney. The staircases leading to the upper rooms are dark, and require skylights or windows with perforated glass panes for ventilation.

The barrack is lighted with candles, although gas can be obtained.

We would recommend that two ventilated gas-burners be introduced into each of the longer rooms, and one similar one into each of the shorter ones.

All the grates are of the old pattern, and should be replaced by better grates to save fuel.

There is no day-room.

There is one ablution-room, situated at too great a distance from some of the barrack-rooms. It has no pegs, and the ventilation is deficient. The latter might be easily improved by a few perforated glass panes in the windows. There are no baths, although, possibly, space might be obtained for two in this lavatory. At all events two fixed baths, with water laid on, are required.

There is one women's wash-house, containing one copper supplied with water, but the wash-house is not provided with any other conveniences for washing or getting up linen. It is too dark, and should have a few glass slates in the roof to increase the light. It should also be fitted up with fixed tubs, and water laid on, gratings for the women to stand on, and a drying and laundry stove.

There is a good, well ventilated cook-house at the lower end of the barrack yard. It would, however, be materially improved by a few glass slates in the roof, and by additional ventilation through perforated panes of glass in the upper window sashes. It should have a ventilated roasting oven, as there are no means of cooking at the present time except by boiling.

The canteen tap is dark and not sufficiently ventilated, and requires a window at the back with bars and a silk flap ventilator into the chimney.

The prison cells and lock-up room are not sufficiently ventilated. The former should have a shaft from the ceiling through the roof, and the latter an inlet for air opposite the present window.

There is a drained privy which admits of being flushed out, but it was very offensive, and it gives rise to nuisance in the adjacent quarters. This privy should be converted into a water latrine on Macfarlane's principle. It should be properly lighted and ventilated, and should have divisions of seats and half-doors.

The adjoining urinal also requires reconstruction on a better plan, with water supplied to it for cleansing.

The ash-pits in these confined barracks ought to be abolished, and an iron cart, with daily removal of refuse, substituted. One contractor with a spare cart or two might easily cleanse all the barracks in this neighbourhood, and prevent any accumulation of decomposing matter near the men's quarters.

Outside the barrack gate are situated the officers' quarters, which are complained of as insufficient. The privy arrangements are defective, and proper water-closets should be substituted. The mess-room has no ventilation. A silk flap ventilator ought to be placed in the chimney.

*The following are the Sanitary Improvements required for Mount Wise Barracks:—*

1. Reduction of the number of men in the barrack-rooms to the extent specified.

2. Ventilation of every barrack-room by shafts and inlets as described. Darker barrack-rooms to have additional windows or skylights. Dark staircases to have a window with perforated glass panes for ventilation, or a skylight. All windows to be made to

draw down at the top. Guard-room to be ventilated by a shaft and inlet. Lock-up to have an inlet opposite the window. Cells to be ventilated by shafts. Library, school-room, and workshops to have shafts and inlets provided. Serjeants' quarters to be ventilated by silk flap ventilators into the chimneys. Canteen to have an additional window, and a silk flap ventilator into the chimney. Barrack-room grates to be remodelled, to save fuel and warm part of the admitted air in winter.

3. Ventilated gas-burners to be introduced into the barrack-rooms.

4. Pegs to be supplied to the ablution-room, and also a few panes of perforated glass for ventilation. Two fixed baths, with water laid on, to be provided.

5. Women's wash-house to be provided with fixed tubs, and water laid on; and to have a drying and laundry stove, gratings for the feet, and a few glass tiles in the roof.

6. Cook-houses to have a ventilated roasting oven put up, and to have additional light and ventilation by glass tiles in the roof, and by perforated glass panes in the windows.

7. Privy to be reconstructed as a water latrine, with divisions of seats and half-doors, and to be properly lighted and ventilated. Urinal to be reconstructed and supplied with water.

8. Ash-pits to be done away with, and an iron cart, with daily removal of the barrack refuse, substituted.

### 11. Bull Point Barracks.

Bull Point barracks are situated about four miles to the north of Plymouth, near the river Tamar, in an elevated healthy position, with ample facilities for drainage. They are constructed to accommodate 96 men and four serjeants.

The buildings are of brick, of recent erection, and consist of two blocks running along one side of the parade ground. One block contains officers' quarters, and the other soldiers' barracks. In rear of the quarters, and separated from them by a narrow back-yard, are the ablution-room, cook-house, privies, ash-pit, &c.

The soldiers' rooms are in two flats. They are entered from the rear by a passage and staircase, which do not go through the building. A serjeants' room fills up the end of the passage opposite the door, and two soldiers' rooms enter right and left from the passage. These rooms occupy the whole width of the building, and have two windows at each end. The door is in the centre of the side, and the fireplace, with the ordinary pattern grate, is opposite the door.

The following table shows the accommodation :—

| Rooms. | Total Present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 6 | 96 | 78 | 18 |

Each of the six rooms accommodates 16 men, in a space which would afford 600 cubic feet per man for 13 men only. The total deficiency of accommodation on this calculation is, therefore, that for 18 men; but the site of the barrack being high and airy, the deficiency is of less importance than it would be in a larger barrack situated in a less favourable position.

The rooms have no means of ventilation, except the windows, door, and chimney.

Each room should have a shaft, and two inlets for air close to the ceiling, one at each end, and the grates should be remodelled, to economise fuel, and to warm a portion of the air admitted for ventilation.

There are four serjeants' rooms, each of which should have a silk flap ventilator into the chimney, and panes of perforated glass should be put into the upper sash of each stair window. The rooms are lighted with candles; gas cannot be obtained at present.

There is no day-room or school-room.

There is no library, but there is a reading-room, which is half a barrack-room, the other half being a regimental store. The reading-room requires a shaft and inlet for air.

The ablution-room is rather dark. Additional light should be given to it by glass tiles in the roof. It has no pegs, and it is not supplied with water. Pegs should be provided, and water laid on to the ablution tables. There is no bath. One is required, with water laid on.

The women's wash-house is dark, and should have more light by glass tiles, and a louvred outlet for the steam through the roof. The tubs should be fixed, and should have water laid on. A drying stove should also be provided.

The cook-house also requires more light through the roof; it has four boilers, but no other means of cooking. An oven to roast and bake meat is required.

There is no drill-shed nor workshop, and there are no married quarters.

The privies have small slate divisions, rising about 1 foot 6 inches above the seats. The seats are over a long sewer, extending from the yard behind the officers' quarters, which forms a receptacle for the soil. This sewer is flushed by means of a tank containing about 2,000 gallons of water, which, when full, is rapidly discharged along the sewer by means of a syphon. This arrangement does not allow of water standing in the privy, as it ought always to do, and whilst it occasionally cleans the bed of the sewer, it does not prevent accumulation against the sides, from the too great depth of the receptacle. The large quantity of water required each time to fill the syphon prevents the flushing being done, except at considerable intervals of time, because the tank is only filled by the waste water from the ablution-rooms, pumps, &c. It would be desirable to reconstruct these privies with a comparatively shallow receptacle, in which water should always stand, with a proper apparatus for flushing at short intervals, and to arrange for a sufficient supply of water by an additional tank for storeage during dry weather, if there is not found to be water enough. When the latrines are reconstructed they should have proper divisions, and half-doors, if there be space for them.

Water is derived partly from the roof, by being received into a large underground tank. The whole of the roof water should be caught and retained, to be used for the women's wash-house, and for baths as far as possible. Besides the rain water supply there are four wells, about 30 feet deep, of which three are stated to become dry in summer.

The urinals should be supplied with water, for occasional flushing.

An ash-pit is placed in the narrow back yard, behind the men's rooms. It is too large, and not properly drained. It should be removed from its present site altogether outside the barrack enclosure, and the barrack refuse should be at once removed to it, instead of being accumulated close to the quarters.

The guard-room is large and roomy. It was occupied when we were there by one corporal and three men. It would be desirable to remodel the grate, so as to economise heat, and to place a silk flap ventilator in the chimney. The officers' guard-room is at present used as a children's school.

The cells are imperfectly ventilated; they require a shaft each through the roof, and an inlet formed by a grated opening into the passage, along with a grated opening from the passage to the open air; a stove for warming the air should be placed in the passage.

There is an ash-pit in the yard close to the cells, which should be removed.

The privy is also close to the cells; it should be converted into a water latrine, with water always standing in it.

There is a privy and urinal to the guard-room, but no ablution-room.

There is a good cleaning shed and ball court.

The canteen is sufficient, but the tap-room requires

a silk flap ventilator in the chimney, and a perforated glass pane in the upper sash of two windows for ventilation,

The non-commissioned officers' room in the canteen also requires a ventilator in the chimney.

Complaint was made by the barrack master that the coal was much deteriorated by there being no shed to cover it. This is, however, a general question and applicable to all barracks.

At the end of the block which contains the soldiers' quarters there is one sick ward, and a surgery at the top of a flight of stairs, entered from the end of the building; below the ward is the regimental store, entered from the same passage, and below the surgery is the reading-room, entered from another passage. The ward has one window at the end and two on the side; it is not used as a hospital, but simply as a room into which any case of illness may be taken from a barrack-room until the ambulance removes it to the general hospital at Stoke Devon. The ward is at present lent to married people. The ward should have a silk flap ventilator in the chimney, and a Moore's louvred ventilator in one window. The windows in the passage, viz., the one over the door downstairs, and the one at the end of the passage upstairs, should each have a perforated glass pane.

*The Sanitary Improvements required for these Barracks are as follows:—*

1. Reduction of number of men in the barrack-rooms.

2. Ventilation of each barrack-room and the reading-room by a shaft and inlets. Ventilation of each non-commissioned officer's room by a silk flap ventilator into the chimney. Ventilation of the staircases by perforated glass panes in the upper sash of the windows. Ventilation of the hospital ward by a silk flap ventilator and by a Moore's ventilator in one of the windows. Ventilation of the canteen tap-rooms and guard-room by silk flap ventilators. Ventilation of the cells by shafts and gratings, as described. Barrack-room and guard-room grates to be remodelled.

3. Ablution-room to be better lighted by glass tiles in the roof. Water to be laid on and pegs provided. One bath, with water laid on, to be provided.

4. Cook-house to have a roasting oven, and more light by glass tiles in the roof.

5. Women's wash-house to have a louvre in the roof for ventilation, and glass tiles for additional light. Tubs to be fixed and water laid on. A drying stove to be provided.

6. All the privies to be reconstructed as water latrines, with proper divisions, and, if possible, with half-doors. Urinals to be supplied with water.

7. Ash-pits to be removed outside the barrack enclosure.

### 12. General Hospital, Stoke Devon.

This is one of the best hospitals belonging to the army. It is designated as a general hospital, but its administration is rather that of an agglomeration of regimental hospitals, to which the sick are transported by ambulance from the different barracks belonging to the garrison. It is situated on the banks of Stonehouse Creek, within an enclosed area of 9 acres and 35 perches.

The grounds are intended for convalescents exercising. It is stated that 15*l.* per annum are allowed for keeping them in order. The sum is evidently not sufficient, for they are in an untidy condition.

The surface of the ground slopes rapidly towards the creek, and the hospital is built across the line of natural drainage, at a short distance from high-water mark. The mud banks on both sides of the creek are exposed to a considerable extent at low water, and very offensive effluvia arise from them, especially during warm close weather. It was at one time supposed that these effluvia proceeded from sewage being allowed to run over the mud banks between high and low water; but we have been informed such is not the case, and that the sewage is now conveyed below low-water mark.

The injurious influence of these mud exhalations is seen on the course of disease in the hospital; and certain classes of cases and of wounds linger, and either recover very slowly or have to be sent away to recover. The site is a bad one, like all sites on the banks of tidal estuaries in which mud is exposed at low water, and it cannot be remedied, except at a great cost.

The hospital consists of four pavilions, each three stories high, ranged side by side, at a short distance from each other, and connected along one end by an open arcade or corridor, enabling all the wards and offices to communicate with each other under cover. An open terrace runs along the top of this corridor, and communicates by a door with the first flat of each pavilion.

The pavilions are of a somewhat singular construction. They are divided lengthwise by a narrow hanging stone staircase, extending the whole depth of the pavilion from the corridor backwards, and from the ground floor to the roof, so as to divide the pavilion into two equal halves, right and left of the staircase. The wards enter right and left of the landings. The staircase is lighted and ventilated through the roof by large skylights. The ventilation would be improved by having a few perforated glass panes inserted into the staircase windows.

The wards, with one exception, extend the whole length of the pavilion, and have the walls of three of their sides exposed to the air. There are windows, eight in number, giving light to each ward. The wards, with one exception, are 60 feet long and 24 feet wide. They are 14 feet 6 inches and 11 feet 6 inches high. They accommodate 22 sick each, with the exception of one small ward, which holds six beds. The following table shows the accommodation of each ward, compared with what it would be at 1,200 cubic feet per bed, the amount which we are required to allot by our instructions: —

| Pavilion. | Wards. | Present Accommodation. | Accommodation at 1,200 Cubic Feet per Bed | Deficiency of Accommodation in Bed Spaces. |
|---|---|---|---|---|
| 1 | Nos. 1 | 22 | 18 | 4 |
| | 2 | 22 | 18 | 4 |
| | 3 | 22 | 15 | 7 |
| | 4 | 6 | 6 | – |
| 2 | 1 | 22 | 18 | 4 |
| | 2 | 22 | 18 | 4 |
| | 3 | 22 | 18 | 4 |
| | 4 | 22 | 18 | 4 |
| | 5 | 22 | 15 | 7 |
| | 6 | 22 | 15 | 7 |
| 3 | 1 | 22 | 18 | 4 |
| | 2 | 22 | 18 | 4 |
| | 3 | 22 | 18 | 4 |
| | 4 | 22 | 18 | 4 |
| | 5 | 22 | 15 | 7 |
| | 6 | 22 | 15 | 7 |
| 4 | 1 | 22 | 18 | 4 |
| | 2 | 22 | 18 | 4 |
| | 3 | 22 | 15 | 7 |
| | 4 | 22 | 15 | 7 |
| Total - | 20 | 424 | 327 | 97 |

In this table we have divided the cubic contents of each ward as nearly as may be into spaces of 1,200 cubic feet; but in every instance the space we have allotted per bed is under that amount. To give it, however, 97 beds will have to be removed from the wards.

The wards have each two air shafts built in the wall and carried up above the roof of the pavilion. The conjoint area of these shafts is hardly large enough to afford the necessary ventilation, and we

would recommend a large silk flap ventilator to be introduced into each chimney, to increase the amount of outlet. Each ward requires two inlets to be placed in the length of the wall, opposite the fireplace, close to the ceiling, to be provided with perforated zinc cornices of the usual construction, for diffusing the admitted air.

These trifling alterations will render the ventilation sufficient.

The skirting in the wards is of wood, and is six feet high. It harbours vermin, and ought to be removed, and the wall cemented instead.

The wards are warmed by grates of the old pattern, one in each ward, nearly in the middle of its length. These grates might be remodelled with advantage to save heat. The staircases are warmed by Nettleton's stoves.

The wards are lighted with candles, and the corridor with oil lamps. The lighting is very deficient, and gas should be substituted. Each of the long wards requires two ventilated gas-burners.

There are no baths connected with the wards, but there is an apartment furnished with slipper baths, &c. between two of the pavilions. The difficulty of reaching it is so great, that it may be considered as of very little use; and it will be necessary to provide suitable baths in connexion with each floor of the pavilions.

There is a laundry for washing the hospital linen, situated at a short distance from the building. The arrangements appear to be sufficient.

There is a good kitchen, adequately supplied with the means of cooking hospital diets. It is at a considerable distance from some of the wards; nevertheless, with proper care, the diets may be delivered hot to the sick.

The water supply is good and abundant, and is obtained from the Devonport Water Company.

The drainage is defective in some points, and, in consequence, there is considerable nuisance, at times, from the water-closets.

It is stated, in a return made to us, that, connected with the hospital, there is a large cesspit which receives the drainage, and which has an overflow into the creek. Should this be the case, it will sufficiently account for the nuisance proceeding from the water-closets, and also for that arising from the gulley grates.

Besides which, if the sewers are not sufficiently ventilated, the rise of the tide must force the sewer gases back into the building. If the cesspit really exists, there can be no question that it ought to be filled up, and a ventilating opening should be made into each of the outlets above high-water mark, and at as great a distance as possible from the hospital. A small pipe should also be attached to each of the water-closet tubes, and carried above the roof of the pavilion.

Each ward has a water-closet entering directly from it. These water-closets are neither sufficiently isolated nor ventilated, and they should be reconstructed in the manner to be hereafter mentioned. At the end of each pavilion furthest removed from the entrance, there is a projection built out, containing the hospital serjeant's quarters, and in this projection are placed the ward sinks, as well as the water-closets, the ward sinks entering from the staircase. The sick wash at these sinks in hand-basins belonging to the wards. The best that can be said of this lavatory accommodation is that it is better than none. There is no doubt that it requires entire reconstruction, with fixed basins, and hot and cold water laid on. There are no proper urinals belonging to the wards.

The obvious method of remedying the deficiencies in baths, lavatories, urinals, and water-closets is to add to the projecting building in which are situated the hospital serjeant's quarters. This can be done without interfering with the light and external ventilation of the wards. In doing so space should be provided either for one fixed bath with hot and cold water laid on for each flat, or for two baths on one of the floors of each pavilion, as may be found most economical, with sufficient additional space to enable each water-closet to have a separate ventilated lobby between it and the ward. Sufficient space will also be required for the ablution basins and urinals.

There are two or three ash-pits near the hospital, which ought to be removed, and provision made for collecting and carting away the hospital refuse daily.

At a comparatively small expense this hospital might be very much improved in these sanitary points. The only way of improving the site would be by banking out the creek, and covering the mud bank, as is proposed at Netley.

There are excellent water latrines on Macfarlane's principle outside the building for convalescents, &c. The urinals are much complained of, and require reconstruction, with water laid on. Several wards in the pavilions are misappropriated, as stores of various kinds, such as pack store, bedding store, provision store, apothecaries' store, &c. We think it unadvisable that space, which is so much required for sick, should be devoted to storeage, which ought not to be within the pavilions at all. The proper place for these stores is certainly not within the hospital, and if they were removed, and provided for by the erection of a suitable building, the pavilions would afford all the hospital accommodation required for the station.

In another respect the accommodation is defective. There is no waiting-room for patients, and the provision made for orderlies is insufficient. In a number of the wards they sleep among the sick, but in one pavilion there is a ward appropriated for their use. It would be easy, in extending the projection behind each pavilion, as already mentioned, to provide a room for the night orderly, but all the others should sleep away from the sick.

There is no accommodation provided in any building for the sick wives and children of soldiers' families, and it has been stated to us that the civil medical charities refuse to admit them. This is a deficiency which ought certainly to be supplied.

*The following are the Improvements required for this Hospital :—*

1. Reduction of the number of beds to the extent stated.

2. Ventilation of each ward to be improved by a silk flap ventilator into each chimney, and by two inlets for air, as described; remodelling the ward grates to save heat; inserting panes of perforated glass into the upper sash of each staircase window.

3. Extending the projecting building behind each pavilion, providing in it a fixed bath, with hot and cold water, for each flat of the pavilions; providing a lavatory with fixed basins, and hot and cold water, with separate hot and cold water taps, for drawing water for use in the wards; improving the water-closets by interposing a lighted and ventilated lobby between them and the wards, and providing a urinal in connexion with the water-closet; ventilating the soil pipes of the closets, by carrying a small pipe from them above the roof of the building.

4. Improving the hospital drainage by abolishing the cesspit, and ventilating the outlets immediately above high-water mark.

5. Reconstructing the urinals outside the hospital, removing the ashpits, and arranging for the daily removal of the hospital refuse.

Lastly. Better accommodation should be provided for the orderlies. A waiting room and proper stores should be erected, and the whole space within the pavilions used for sick.

SIDNEY HERBERT.
JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission, February 4, 1859.*

# EASTERN DISTRICT.

Sir,

Having examined into the sanitary condition of the barracks and hospitals at Colchester, Harwich, Yarmouth, Norwich, and Ipswich, we have the honour to transmit to you the following reports on them.

## 1. COLCHESTER CAMP.

Colchester Camp is placed on high ground, about a mile to the south-east of the town. The situation is open, airy, and healthy. The subsoil is gravel, and may be considered as self-draining ; but it is not on that account to be depended on for drainage to the neglect of other means, because porous soils occupied by a numerous population, as is the case with this camp, may be a source of health or of disease to the inhabitants in proportion as their drainage is made efficient or is not attended to.

The occupied ground is a parallelogram, 32A. 2R. 12P. in area, enclosed within a wall higher than the huts, whereby the free sweep of the air over the camp is materially impeded.

Within this area are congregated 2,469 non-commissioned officers and men, 219 women with their families, belonging to married soldiers ; so that, including officers, the population exceeds 3,000 persons, giving a density of 51,000 to the square mile.

The barrack accommodation consists entirely of huts arranged side by side, at about 20 feet from each other. The ends of the huts are towards the wider thoroughfares, which run in parallel lines the length way of the camp.

The first thing which strikes the eye in the arrangement is this, the huts are much too close together to be healthy, and that it would have been much safer to have placed them at double the distance from each other.

Almost the entire area of ground presents an appearance of dampness. Foul water was lying in defectively made gutters here and there, and we were informed that, during wet weather, parts of the surface became wet and sloppy. These two conditions, overcrowding of surface area, and a wet, undrained state of the subsoil, are hazardous to health even in the open country.

But the huts themselves are also overcrowded. At the time the return was made to us, the men's accommodation consisted of 120 of these wooden huts. Each hut is 38 feet long, 20 feet broad, and 9 feet high, giving 6,840 cubic feet of contents, and to each of these huts twenty-four men were allotted, giving, on an average, only 285 cubic feet per man. The following table gives the accommodation, in comparison with what it would be at 400 cubic feet per man, the amount which ought to be sufficient for health in properly constructed and properly arranged camp huts in this climate :—

| Huts. | Total present Regulation Accommodation. | Total Accommodation at 400 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 120 | 2,880 | 2,040 | 840 |

At the very moderate allowance of 400 cubic feet per man, the accommodation at Colchester Camp was deficient to the extent of 30 per cent. at the time referred to. Although the camp consists essentially of wooden huts, there are some huts constructed of iron. In all iron or brick huts the essential quality of wooden huts, namely, their being pervious to air, is wanting, and they do not admit of healthy occupation with less than 600 cubic feet per man.

In order to diminish the effect of overcrowding on the health of this camp, it will be necessary to reduce the accommodation in wooden huts from 24 men to 17 men per hut, and in iron huts, of the same dimensions as the wooden huts, the numbers should be reduced from 24 to 12 at the very least. Eleven men per hut would be a better number, but it would allow more than 600 cubic feet per man, while 12 men will have a small fraction under that amount.

The huts generally are not raised high enough above the ground. There should be at least one foot or 18 inches of clear space above the level, with free ventilation underneath.

The average number of windows per hut is 10. They are 3 ft. 10 in. wide by 2 ft. 9 in. high, and are placed along the sides and at the ends.

Ventilation is provided by several louvres in the length of the ridge. The state of the air was, nevertheless, far from being pure in huts even partially occupied during the daytime when we inspected them. One cause of atmospheric impurity in these and similarly constructed huts is the want of a porch in which to keep urine tubs, mops, &c. The urine tubs are of course placed in the huts at night, and during the day, after being emptied, they are partially filled with water and placed in a corner of the hut. It would be an immediate improvement in this camp to provide a porch for each hut, where the urine tubs could stand by night as well as by day, so as to free the interior from the present nuisance arising from these tubs.

Warming is effected by iron stoves. They are dangerous, and bad in other respects. Brick fireplaces, with remodelled grates, would be more economical and healthy.

At the time of our inspection the huts were lighted with candles, although there was gas in the canteen within the area. There can be no doubt of the greater economy of gas, and we would certainly advise its being introduced throughout.

There are three school-rooms and one excellent library, but no day-room. There was space, however, on which a suitable hut for the purpose could be erected.

Ablution accommodation, consisting of six huts, with benches, basins, and gratings, have been provided. They all require pegs for hanging coats on.

An excellent form of bath has recently been provided for these ablution houses. It is built in the ground and lined inside with cement. It is among the cheapest forms of bath we have met with, and should it prove to be durable it might be introduced where similar material can be obtained. There were three such baths with water laid on in small light bath closets at one end of the ablution houses we examined, and this accommodation is being extended.

Washing is done in six women's wash-houses. They have boilers, and are supplied with water from pumps close at hand. The floors were very imperfectly drained at the time we saw them, and there were no means of drying linen. All these wash-houses should be improved in the same way. They should be provided with washing troughs and water laid on, and the troughs should be drained properly, instead of the foul water being emptied on the floor. Drying closets, or at least drying stoves, and means of ironing linen should also be provided.

There are 13 iron cook-houses provided with boilers, but not all provided with ovens. Various forms of arrangement of boilers and ovens were in use. The whole appeared to be in a transition state towards a better provision for varying the cooking.

There are no drill-sheds, and this want is much felt in this camp on account of the large number of men constantly under training.

The only workshops are six for tailors, and the same number for shoemakers. There is no general provision for employing the men.

Water for the whole camp is derived from 24 shallow wells, dug in the porous subsoil on which the camp is situated. It would be most advisable to obtain another source of supply, and to have the water laid on constantly, instead of drawing it from

shallow wells, which are liable to become polluted by infiltration from the inhabited surface above.

We have already alluded to the condition of the surface drainage. There was some provision for removing the roof water by imperfectly-formed gutters, and also for removing the waste water from ablution and bath-rooms, cook-houses, &c. by shallow drains, but there is no proper sewerage for latrines, and the subsoil is not drained.

The greatest care is required in laying out the drainage of fixed camps. The whole area occupied either by tents, huts, or parade grounds should be so thoroughly underdrained to the depth of four feet as to prevent water accumulating in the subsoil. This is a cardinal point in the laying out of all permanent camps, and is one of the most essential improvements required for Colchester camp.

From want of this, and also from overcrowding and defective ventilation, both within and without, this camp has suffered from severe types of fever, from which the men would in all probability have escaped in permanent barracks.

Fixed camps in well chosen positions will be much more healthy, or less healthy than permanent barracks, just in proportion as sanitary precautions are observed or overlooked. This is the experience of all camps. It only requires a little time to show the consequences of sanitary defects in them.

A short time ago the latrines of Colchester camp were reconstructed with iron pans, in which the soil is collected and removed nightly. They are placed in iron hut buildings. This arrangement gives rise to a constantly recurring nuisance and cost, although it is far less likely to injure the health of the camp than cesspits would be. Its adoption is therefore a step in the right direction so far as regards health, but it would in our opinion be far preferable to sewer and drain the camp properly and to provide water latrines from which the soil could be flushed to an outlet where it could be applied for manure.

If such an outlet or any other outlet for the latrine drainage cannot be obtained we still recommend that water latrines, from which the contents could be removed daily in a closed cart, should be introduced, for by this arrangement the nuisance from the latrines would be prevented.

The accommodation for married non-commissioned officers and soldiers consists of 207 rooms. Generally they are formed of ordinary barrack huts, divided by bulkheads into eight very small apartments.

In 147 of these rooms there are no proper means of cooking, generally one small stove to six families. Part of the married quarters we inspected were hardly fit for occupation. They were overcrowded and every way uncomfortable, but it was stated to us that they were occupied only temporarily.

There are three small mess-rooms for non-commissioned officers.

There are five guard-rooms and a provost establishment. The guard-rooms are not sufficiently ventilated.

One of the best portions of the camp is the canteen, a large wooden building erected by the canteen keeper under inspection.

The rooms and bar are of a very superior order, large, roomy, well lighted by abundance of windows, and by gas at night. The rooms are ventilated and very comfortable. Along the front of the building there is a verandah with a glass roof, light and cheerful, affording protection to the men in wet weather without interfering with the light of the tap-rooms. Altogether the establishment is one of the best we have seen.

*The Sanitary Improvements required for Colchester Camp are as follow:—*

1. Reduction of overcrowding by limiting the number of men in each wooden hut to 17, and in each iron hut to 12.

2. Increasing the number of ridge louvres for ventilation by adding other two to each hut. Ventilation of guard-rooms to be improved.

3. Affording to each hut free ventilation under the flooring, so far as it may be practicable to do so.

4. Each hut to have a porch, capable of protecting the entrance, and affording space for urine tubs, &c.

5. Underdrainage of the whole camp to dry the subsoil. Improvement in the surface drainage by better guttering.

6. Privies to be converted into water latrines, either drained to a suitable outlet or, if that be impracticable, the contents of the latrines to be flushed daily into a water-tight cart and removed. Proper urinals to be constructed in connexion with the improved latrine arrangements.

7. Gas to be introduced into the huts.

8. Ablution-rooms to have pegs.

9. Womens' wash-houses to have fixed tubs, water laid on, and means of drying and ironing linen.

10. A better water supply for the camp to be provided.

Lastly, the deficiencies in married quarters, day-rooms, &c., should be remedied at the earliest possible period.

*Colchester Camp Hospital.*

This hospital consists of a double range of wooden huts, with the ends fronting each other, leaving a long wide passage between the rows, which passage is covered throughout its entire extent by a wooden roof. The huts are much too close to each other for thorough light and ventilation, and together with the long gloomy passage, the whole establishment has not that light cheerful look which it might have had.

It is enclosed by a railing within which there is a sufficient exercising ground for convalescents.

There are altogether 19 hospital huts, containing 12 beds in each, with 696 cubic feet per bed.

The huts are of the usual construction and are raised above the level of the ground. They are 38 feet long, 20 feet wide, and 11 feet high, with sloping roofs. There is a partial wooden ceiling, in which are two circular ventilating openings a foot in diameter, communicating with a ventilator at each end. The principle is not a good one, and we should advise that instead of it a shaft should be carried from each ceiling, opening through the roof.

Each ward is warmed by stoves. There are lavatories and a bath. The kitchen arrangements are sufficient for hospital cooking.

The drainage is of the same character as the barrack drainage generally, and should be improved along with it. Iron pans are used instead of latrines and water-closets. Water latrines properly drained would be much better.

Water is obtained from a well 48 feet deep, within the hospital enclosure. It requires much labour to raise the quantity required, and a better source of supply should be provided for both camp and hospital.

Candles and lamps are used for lighting the building, although gas could be obtained.

The storeage is said to be rather limited in extent for a hospital of this size.

The main defects of Colchester hospital are similar to those of the barracks. It is not sufficiently exposed to free circulation of air outside, and the ground is not sufficiently drained. The huts are too close together, and this circumstance, together with the corridor, gives the wards a dark appearance. The ventilation is not enough. In other points, such as the kitchens, the arrangements are good.

*The following are the chief Improvements we would recommend:—*

1. Ventilating the wards directly by shafts through the roof.

2. Improving the drainage of the whole site, and converting the present privies into water latrines, drained to an outlet.

3. Introducing gas.

## 2. LANDGUARD FORT, HARWICH.

Landguard Fort is situated on a long spit of shingle forming the eastern boundary of Harwich harbour.

It is surrounded by a deep ditch, completely isolating the area occupied by the buildings of the fort from the neighbouring ground, a point, as we shall presently show, of much importance as regards the drainage of the fort. The buildings are arranged in square behind the ramparts, leaving a parade ground in the middle. The men's rooms are on the west side, and at the end of the range is situated the hospital, which is simply a continuation of the range.

The officers' quarters form the north side of the square. The other two sides are occupied by the guard-room, stores, &c.

The men's rooms are in three stories. Part of them are reached by stairs and passages from the parade ground; part of them by stairs leading from the ramparts behind.

The buildings are of brick, and of old construction. There are 26 barrack-rooms, several which are less than 8 feet high, and none of them exceed 8 feet 4 inches in height. They vary in length from 15 feet 5 inches to 30 feet 10 inches, and in breadth from 11 feet 9 inches to 17 feet 11 inches. They are very irregular as to size. Some go through and through the buildings, others are back to back. Two of them have no windows; eleven rooms have only one small window per room, and the remainder have, some two, others three windows, but none more than three.

The total accommodation is intended for 160 men, with an amount of space varying from 228 to somewhat over 600 cubic feet per man.

The following table gives the details of the accommodation per each room :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| A. 1, 2, 3 - | 21 | 15 | 6 |
| B. 1 - - | 4 | 4 | — |
| | 5 | 2 | 3 |
| B. 2 - - | 4 | 4 | — |
| | 12 | 6 | 6 |
| B. 3 - - | 4 | 4 | — |
| | 12 | 6 | 6 |
| B. 6, 7, 8 - | 15 | 12 | 3 |
| C. 1 - - | 4 | 4 | — |
| C. 2 - - | 4 | 4 | — |
| | 16 | 6 | 10 |
| C. 3 - - | 4 | 4 | — |
| | 16 | 6 | 10 |
| D. 1, 2, 3 - | 12 | 12 | — |
| D. 6 - - | 4 | 4 | — |
| | 5 | 2 | 3 |
| D. 7 - - | 4 | 4 | — |
| | 5 | 2 | 3 |
| D. 8 - - | 4 | 4 | — |
| | 5 | 2 | 3 |
| Total - | 160 | 107 | 53 |

The present regulation number of men in the fort is 33 per cent. in excess of the accommodation at 600 cubic feet per man. Some rooms are much more crowded than others. One 16-men room affords only 245 cubic feet per man.

As a whole the rooms are of a very inferior description, and most of them are far from being comfortable.

There is some provision for ventilation by means of hollow beams carried across the ceilings, with openings at intervals, but the beams are scarcely sufficient for renewing the air. We would propose to supply each room with a ventilating shaft and inlet of the usual construction, and to place a ventilating fire-grate in all the larger rooms. One barrack-room is used as a school-room, and requires ventilation like the other rooms. Each staircase should likewise be ventilated by a louvred shaft carried above the roof.

The rooms are lighted at night by candles. Gas is not obtainable.

There is an ablution-room with the usual fittings, and a bath recently put up in one of the casemates.

There is no day-room and no library.

The women's wash-house is very deficient in requisites for washing. It should have fixed tubs, gratings, and means of drying linen.

The cook-house has boilers, and there is a sufficient oven in another apartment.

Water is brought by pipes into the fort from a distance of 1½ miles. It is stated to be good, and abundant in quantity.

A great defect in these barracks is the state of the drainage. There is a single untrapped gulley which receives all the surface and other water and communicates with a cesspit in the ditch, the overflow from which passes away by a rubble drain to the sea. The plan is a very old and bad one. The drains are liable to constant obstruction, and while we were at the fort the whole of them were being opened to remove the deposit, which was simply thrown into the ditch, where it would be allowed to dry. The whole system requires to be remodelled. The ground and buildings inside the fort should be drained, and the sewage carried across the ditch by means of an iron pipe to the point of discharge into the sea.

The latrines within the fort are of the usual construction, but they are intended only for night use. There is a latrine for the day time outside the fort. Those within are emptied by contract. Both sets should be remodelled on Macfarlane's plan, and their contents flushed out daily.

There is no separate accommodation for married non-commissioned officers and soldiers; except such as is afforded by some very inferior attics. When the barracks are not full temporary accommodation is found in some of the vacant barrack-rooms. The rooms, such as they are, should have Arnott's ventilators put into the chimney breasts.

The guard-room is under the archway at the gate. It is very dark, and requires ventilation by a shaft and remodelled grate.

The fort is practically a long way from any town or village, and the men are said to have no sufficient means of occupation or amusement, especially during long winter nights. A library and reading-room are urgently required.

*The Sanitary Improvements required are as follow:—*

1. Reduction of the inmates in each barrack-room to the extent shown in the table.

2. Ventilation of each barrack-room and the school-room by a shaft and inlet. Remodelled fire-grates to be put into the larger rooms. Stairs to be ventilated by shafts through the ceiling and roof. Guard-room to be ventilated by a shaft and remodelled grate. Non-commissioned officers' rooms to be ventilated by Arnott's valves.

3. Women's wash-house to have fixed tubs, gratings, and means of drying linen.

4. Fort to be drained to the sea. Privies to be converted into water latrines, and flushed out daily.

5. A library and reading-room to be provided.

### *Landguard Fort Hospital.*

The hospital consists of three rooms at the end of the barrack range. It was unoccupied at the time of our inspection. Two of the rooms are only 7 feet 6 inches in height, and the other is 8 feet 6

inches high. The following is the accommodation for sick :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 600 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| No. 1 | 4 | 1 | 3 |
| „ 2 | 6 | 3 | 3 |
| „ 3 | Occupied by Hospital Attendant. | — | — |
| Total | 10 | 4 | 6 |

This building should certainly not be appropriated for more than four sick. It has none of the attributes of an hospital. Ward No. 1 is occupied by the hospital attendant, and serves at the same time as the hospital kitchen. It is on the ground floor ; above it are the other wards, one of which is an attic. There is no accommodation for sick except the rooms and the beds. There is no water-closet, no means of ablution or of bathing, no suitable accommodation for attendants, no drainage, all the refuse water has to be carried away by hand, no water supply, no provision nor pack store, and, as already stated, there is no separate kitchen. Where the space is so restricted as it is in this instance it is simply impossible to provide the requisite accommodation for sick. If the barracks were fully occupied, and the troops had 10 per cent. sick, which is the usual hospital provision, the overcrowding would be excessive. But we were informed that on account of the healthy nature of the site very few men are ill.

We should propose simply to make the best of the case by improving the present accommodation, *and with this view we would recommend as follows:—*

1. Each ward to be ventilated by a shaft and inlet. A remodelled grate for each ward to be provided. Stair to be ventilated through the roof.

2. A water-closet with space for a bath and for an ablution table to be constructed, or if this be impracticable, the present hospital privy to be converted into a water-closet, and drained into the proposed system of barrack drainage.

3. Water to be laid on, the hospital to be drained, and a trapped sink to be provided for waste water.

### 3. The Redoubt, Harwich.

This redoubt is circular in form, and is situated on a rising ground south of Harwich. It consists of a series of elliptical casemates surrounding a circular court or well. Above the casemates are the guns. The whole structure, which is of solid masonry, is buried in the mass of the hill almost to the embrasures, and is separated from the hill all round by a deep ditch, of which the outer wall of the casemates forms the interior line. The bottom of the ditch is drained. Although, therefore, the works are protected by the hill all round, they are completely detached from the earth, and not affected by damp from it.

There are in all 18 casemates, 8 of which only are used as men's rooms. The remainder are occupied as officers' quarters, cook-house, stores, guard-room, sick-room, &c. &c. The present regulation accommodation is for 118 men, with about 471 cubic feet per man.

The following table gives the details :—

| Casemates. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| No. 1 | 16 | 12 | 4 |
| „ 2 | 12 | 9 | 3 |
| „ 3 | 16 | 12 | 4 |
| „ 5 | 16 | 12 | 4 |
| „ 11 | 15 | 12 | 3 |
| „ 12 | 12 | 9 | 3 |
| „ 13 | 15 | 12 | 3 |
| „ 15 | 16 | 12 | 4 |
| Total - - | 118 | 90 | 28 |

These eight casemates would contain 90 men at a little more than 600 cubic feet per man.

These casemates have means of ventilation at both ends. It would improve them very much to introduce remodelled grates.

The sick-room was unoccupied at the time of our inspection. It is not fit for any hospital purpose, except on emergency, and the hospital at Landguard Fort is separated from the redoubt by the estuary of Harwich harbour. If the redoubt were to be occupied permanently, it might be well to provide some place in the neighbourhood in which sick could be treated.

There is an ablution and bath-room, and the kitchen is supplied with an oven.

There are two sets of privies. One outside the fort, on the edge of the glacis, consists of a temporary wooden structure, very foul and offensive. Within the fort some iron pans are placed in a casemate for privies. It would be a much better plan to convert both privies into water latrines. An iron pipe carried across the ditch would enable this to be done. It is most desirable in such a structure as this, placed as it is below the ground, to provide for the direct removal of every matter likely to become injurious to health.

*We would recommend as follows:—*

1. Reduction of the number of inmates to give 600 cubic feet in each casemate.

2. Converting the privies into water latrines.

### 4. Yarmouth Arsenal Barrack.

Part of this barrack was not originally constructed for its present object. It was erected in 1808 for ordnance stores, and was converted into temporary barracks in 1855. It is situated on the west side of Yarmouth harbour, at some distance from its mouth, and within a few yards of the water. There is, indeed, only a narrow quay between one of the barrack gates and the river. The distance in a straight line to the sea is about half a mile. The area of ground is 4 A. 0 R. $1\frac{1}{4}$ P., two acres of which are occupied by the barrack buildings. The parade ground is about level with high-water mark. The subsoil is sandy, and the district within which the barrack is situated is damp, and its population suffers from ague. It was stated to us that fever and rheumatism had occurred in two successive occupants of a single officer's quarter, which was unoccupied in consequence at the time we were there. At the date of our inquiry 18 men of the troops in occupation were in hospital, six of whom were reported to be suffering from intermittent fever. Taken as a whole, the site is far from being a healthy one, and is only fit for occupation on an emergency. If there be no urgent military reasons for retaining possession of it, we can safely say that the ground and buildings would be much better suited for other purposes than as a permanent barrack for troops.

We shall, however, deal with the barrack as it is, with the view of improving its sanitary condition as far as it may be practicable to do so. The local position does not, of course, admit of improvement, but in

some points the buildings could be rendered more healthy.

The buildings occupied by men consist of a large central block, formerly an armoury, and of two side blocks built at right angles to it. These three blocks enclose the parade ground on three sides, the fourth side being formed by a high wall and gate, outside which is the quay and harbour already mentioned.

On the side of the armoury opposite the barrack square there is another smaller square, of which the sides are formed by the armoury, officers' quarters, kitchens, guard-room, offices, &c.

At one end of the armoury, and behind the line of the barrack ranges, is a small enclosed square of one-story buildings, in which there are three 25-men rooms, a serjeants' mess, kitchen, and store-room. The men's rooms have windows on one side only; they are low, and imperfectly ventilated. There is a corresponding square on the opposite side, also containing three 25-men rooms of the same description, together with the school, &c.

There is a scattered neighbourhood occupied by timber yards, dwelling houses, and other buildings outside the boundary. The position is tolerably open, but on account of its being low the barrack-rooms have not the benefit of a good external ventilation. The barrack enclosure is simply a wooden fence.

There are altogether 16 men's rooms and 55 non-commissioned officers' rooms on the construction, and there is regulation space for 430 non-commissioned officers and men, at from 350 to 939 cubic feet per man.

The following table gives the details for each room :—

| Barrack-rooms. | Present Regulation Number of Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| C. No. 1 | 25 | 21 | 4 |
| „ 2 | 25 | 25 | — |
| D. „ 1 | 25 | 21 | 4 |
| „ 2 | 25 | 25 | — |
| E. „ 1 | 25 | 22 | 3 |
| „ 2 | 25 | 25 | — |
| F. „ 1 | 25 | 21 | 4 |
| „ 2 | 25 | 25 | — |
| G. „ 1 | 32 | 32 | — |
| „ 2 | 28 | 28 | — |
| H. | 25 | 14 | 11 |
| I. | 25 | 14 | 11 |
| K. | 25 | 14 | 11 |
| L. | 25 | 14 | 11 |
| N. | 25 | 14 | 11 |
| P. | 25 | 14 | 11 |
| Total 16 | 410 | 329 | 81 |

These rooms, it will be observed, consist of two groups, in one of which there is little or no deficiency, while in the other group the deficiency of space is very considerable. The rooms H to P have regulation space for 150 men, where no more than 84 men ought to be placed, while the group C to H have regulation space for 260 men, with an apparent deficiency of accommodation for no more than 55 men. All the rooms in this group except four would accommodate more than their number at 600 cubic feet per man, so that in these rooms there is an apparent excess of space, but the excess is only apparent, on account of the unusual height of the rooms, and as height by itself does not fulfil all the conditions required by increased cubic space, we are of opinion that no more men should be placed in these rooms than the numbers given in the table. The four rooms C 1, D 1, E 1, and F 1, in which the space falls below 600 feet per man are from 11 feet to 11 feet 4 inches high, while all the rooms in which the table shows no deficiency of accommodation are from 16 feet 6 to 17 feet 4 inches high, the space being hence above the beds rather than around them. This arises from the circumstance that some of the rooms, as, for instance, those in the armoury, are more lofty in the side walls than barrack-rooms generally are, while nearly all of the lofty rooms want ceilings, and have the space which ought to be above the ceiling taken into them.

The rooms H to P are 10 feet 3 inches high. The rooms in the barrack-houses, C to G, are from 49 feet 5 inches to 49 feet 10 inches long, and from 23 feet 10 inches to 30 feet 8 inches wide. The remaining rooms are a little over 41 feet long, and about 21 feet wide.

By far the best men's rooms in this barrack are those in the armoury. They are spacious and well-lighted, and have a sufficiency of windows on opposite sides.

The rooms in the houses along the sides of the parade ground are by no means so good, and they have windows only on one side. The newer rooms in the small squares are also of an inferior description. Until recently, several rooms were used as a hospital, for which purpose they were totally unfit. They have very properly been abandoned, and the sick are now received into the general hospital, where wards have been given over for the purpose. The former hospital is now used as married quarters. The general construction of the men's rooms along the sides is not good. They are imperfectly lighted; the stairs in some of them pass directly from the rooms below to the rooms above, so that the foul air can enter the upper rooms. The rooms on the ground floor are not sufficiently raised above the ground to admit of that free ventilation required between the ground and flooring in all barracks built in districts where malaria exists.

All the rooms are imperfectly ventilated. Eight of the 25-men rooms have air bricks in the walls, but no shafts. Six 25-men rooms have two perforated zinc ventilators each. Two rooms, those in the armoury, are not ventilated. The upper rooms in all the barrack-houses are cold from want of ceilings. They have the usual regulation grate, which is insufficient for warming them at present. Wherever practicable, additional light should be given to the darker barrack-rooms, by windows in the blank walls. All the upper rooms should be ceiled. Ventilation should be provided by shafts of the usual construction, carried above the roof, and the inlets should be improved on the principles we have adopted in other barracks;—by the area of the inlets being enlarged to afford the requisite amount of air, and also by providing means for diffusing the inflowing current. All the fire-grates should be remodelled, to heat part of the air admitted.

The staircases which open into the upper rooms should be boxed off, and carried up to the roof, with a ventilating skylight above.

The serjeants' rooms are supplied with inlets for air, but should have Arnott's valves introduced into the chimneys.

The barrack-rooms are lighted with candles, and the exterior with lamps. Gas can be obtained, and should be supplied.

There are two school-rooms, one for adults and one for children. There is a library, and also a reading-room. They are tolerable rooms, except that one of the school-rooms is deficient in window-light. They all require ventilation, warming, and lighting, like the barrack-rooms.

There is no day-room, cleaning-room, nor drill shed. The only workshop is a small one for tailors at the end of one of the barrack-rooms. It is inconveniently situated, and unventilated.

This barrack has an excellent ablution-room on one side the square. It has 25 fixed enamelled basins, with water taps to each, and a copper boiler with pipes for supplying warm water. It is one of the

most complete ablution-rooms we have seen, but would afford only about half the ablution accommodation required if the barracks were fully occupied. A similar ablution-room for the opposite side of the square would supply the deficiency. There are no baths ; four would be sufficient for the full strength.

Behind the east side of the barrack there has been recently erected the most complete small barrack wash-house we have anywhere met with. It is a lofty, light, spacious, and well-ventilated room, supplied with fixed tubs, gratings, boilers, and water laid on. Behind the range of boilers is a drying-closet, heated by the waste heat of the boiler-fires. This wash-house affords every required convenience for ordinary barrack washing. There is a cook-house with seven boilers and an oven. It requires ridge ventilation by louvres. Another cook-house is required for the opposite side of the square.

Water is derived partly from the water company's mains and partly from rain water collected on the roofs. There is a fire-tank capable of holding 25,000 gallons.

The latrine accommodation is imperfect. It consists of a deep trough, with means of flushing out the soil. There are divisions of corrugated iron between the seats. There is no separate accommodation for women, who are merely divided from the men by a corrugated iron bulkhead. The whole arrangement, although recently constructed, is offensive and noisome. Macfarlane's latrines should be substituted for those now in use, and a better form of urinal outside the latrine buildings should be provided. Separate latrine accommodation for women and children is also required.

The present guard-room and lock-up room are very small, insufficient, and inconveniently placed. The officers' mess, which adjoins them, has no anteroom, and no messman's room, nor pantry. It is stated that by a re-arrangement of existing buildings an anteroom could be provided, and the guard-room removed to a better position.

There is no canteen and no ball-court ; but there is plenty of vacant ground on which to place them.

Both officers' quarters and barrack stores are deficient.

This barrack is deficient in so many points that considerable outlay will be required to improve and complete it. On the other hand the site is not a healthy one; and, no doubt, were it deemed necessary to build a new barrack a much better site could be obtained. The alternatives presented are, therefore, either to build a new barrack or to improve the present one as far as possible. Should it be considered advisable to adopt the latter alternative, *we would recommend as follows* :—

1. That the number of men per room be allotted in conformity with the table, subject to any further reduction in numbers which may be required to give 600 cubic feet per man when the rooms are ceiled.

2. That ceilings be provided for the rooms requiring them.

3. That shafts, inlets, and remodelled fire-grates, of the usual construction and ventilating area be provided for all the barrack-rooms, school-rooms, library, and reading-rooms. Tailors' shop to be ventilated by a shaft and inlet.

4. That in rooms with windows on one side only, windows be provided on the opposite side where practicable.

5. That the staircases terminating in upper rooms be continued to the roof, and lighted and ventilated above.

6. Arnott's valves to be introduced into the serjeants' rooms.

7. The barracks to be lighted with gas.

8. Additional ablution-room and four baths to be provided.

9. Additional cook-house to be provided.

10. Latrines to be reconstructed on Macfarlane's principle, and properly supplied with water. Urinals to be reconstructed outside the latrines. Water latrines to be provided for women and children.

11. A suitable guard-room and lock-up room to be provided, and supplied with shafts and remodelled grate for ventilation and warming.

12. Officers' quarters and mess establishment to be improved as suggested. Canteen and ball court to be provided. Stores to be extended. Day-room, cleaning-room, and drill-shed to be provided. Barrack ground to have a proper enclosure.

*General Hospital, Yarmouth.*

This hospital belongs to the Royal Navy, but is at present occupied by the Army as an invalid establishment for men arriving in ill-health from foreign service. Recently, on account of the hospital accommodation at Yarmouth barracks being quite unfit for sick, several wards have been set apart as a regimental hospital, and were occupied as such at the time of our inspection.

The total area within the hospital enclosure is about nine and a half acres. It is a parallelogram, with the hospital at one end of it. The governor's house and medical officers' quarters are in two buildings, placed on opposite sides of the other end of the ground.

The site is on a sandy subsoil close to the sea, at a short distance from the built part of the town. It is open, airy, and healthy. Although the climate is cold during east and north-east winds, it is said to be well adapted for invalids, who recover rapidly.

The hospital consists of four pavilions arranged in square with the angles open.

Each pavilion is 260 feet long, and two stories high. Three of the pavilions are used for sick men, and the fourth pavilion is intended for sick officers, stores, &c. Each pavilion contains eight wards, four on each floor, with a spacious staircase carried up between them. The chapel, operating theatre, surgery, &c. are placed in the centre of the length of the pavilions.

All the entrances to the wards are connected by an open corridor one story in height, which is carried round the ground floor, and encloses the inner court of the hospital. This court is used partly as a garden, and partly as an exercising ground. The building affords an illustration of a good ground plan, and taken altogether this is perhaps the best hospital in the United Kingdom.

There are 25 wards occupied by sick and invalids at the present time. Twenty-one of these are from 42 to 43 feet in length ; one ward is 40 feet 9 inches long ; two are between 22 and 24 feet long ; one is 14½ feet long. Nearly all are from 23 to 24 feet wide, and they vary in height from 13 feet 9 inches to 14 feet.

Each ward, except those of the smallest size, has from 9 to 10 windows arranged on opposite sides of the ward, and they have each one fireplace.

The wards were originally intended for 14 beds each, but recently the number of beds has been reduced to 12 in each of the larger wards, in order to raise the cubic space as near as possible to that required by the new medical regulations, and it ranges from 1,124 to 1,230 cubic feet per bed. The total present accommodation in the occupied wards is for 276 beds.

None of the wards are ventilated, except by door, windows, and fireplaces. The lower wards have an opening over the door into the passage, but it is of very little use.

There is sufficient space for non-commissioned officers.

The wards enter right and left out of the passages, and between each pair of wards, on both floors, are two nurses' rooms, 9 feet 9 inches long by 8 feet broad and 14 feet high. One of these rooms is attached to each ward. Between each pair of nurses' rooms are the water-closets.

The hospital is lighted with gas, and there are stoves in the passages for warming.

There are lavatories and bath-rooms away from the wards, and not conveniently situated for sick and ailing men.

There is an ample water supply from four wells by means of pumps. The water is stated by the medical officer to be good.

In a small court in front of the main entrance to the hospital is a row of one-story shed buildings, one of which is used as a kitchen. It is insufficient for its purpose, and a plan has been submitted for improving it.

The buildings are drained into the yard.

There is ample space for stores.

By altering the arrangement of the interior, in which there is at present much lost space, this hospital might be made an excellent establishment, in every way adapted for its object, while the accommodation might be materially increased. It would be quite worth while to do this if the building were permanently taken over by the War Office.

As a place for invalids arriving from warm climates, the situation is very good. There are excellent piers by which sick could be landed. It is, in short, just the kind of establishment required for invalids, the best proof of which is the rapidity with which the health of such invalids is benefited after arrival.

The wards in their present state require ventilation by shafts, inlets, and remodelled grates. The staircases should have moveable glass louvres in the upper panes of the windows. The kitchen also requires improvement. Bathing and ablution accommodation should be provided nearer the wards ; and, lastly, all the nurses' rooms should have Arnott's ventilators in the chimneys.

Ventilation of wards, &c., and improvements in the kitchen might be carried out at once. But further alterations, if considered advisable, should be undertaken with reference to a general re-arrangement of the interior of the building.

### 5. Norwich Cavalry Barrack.

Norwich cavalry barrack is situated within a spacious enclosure on the north-east side of the city. It is in the suburbs, and has few houses near it. The ground slopes from a height behind the barracks towards the river Wensum, which passes in front of the entrance gate, and the buildings and the parade ground are both situated on the slope. The fall is so considerable at one end of the ground that a block of stables and men's rooms in that situation has been raised on arches to bring them to the level. The subsoil is sandy, and the means of natural drainage are ample.

The barracks are arranged in blocks. Three of these, the centre one being officers' quarters, extend in line along the higher end of the ground, which has been partly excavated to find a level line on which to place them. Another block, already mentioned, of stables and men's rooms raised on arches is placed at right angles to the main line at one end. Opposite this block a riding school has been recently erected. The whole forming three sides of a long parallelogram, with the angles open. Further down the slope, below the riding school, is the hospital ; and close to the lower enclosure wall are the guard-room, cells, canteen, &c.

So far as regards situation and general arrangement of the buildings, there is nothing objectionable, always provided that advantage were taken of the facilities afforded by the ground for draining it efficiently ; but, apart from the situation, the barrack is not a good one. All the blocks have stables with men's rooms over them, and the objectionable internal corridor for access. The rooms are mostly low and gloomy ; the internal corridors dark, and without proper ventilation ; the paving outside the buildings is rough and bad ; the parade ground is much cut up, and not in good condition ; and the barrack generally has an appearance of disrepair about it.

One of the blocks, that nearest the riding school, differs in some respects from the other two. It is of more recent construction, having been rebuilt after a fire. It has better windows, and the rooms are on the whole better than those in the older parts of the barrack.

The rooms in the west wing are all of a size. Each room is 28 feet long, 16 feet wide, and 8 feet 4 inches high. Those in the right wing are all 16 feet wide and 7 feet 11 inches high, and, with the exception of two 15 feet rooms, they are all 28 feet long. The left-wing rooms (those of most recent erection) are 16 feet wide and 9 feet 8 inches high. Ten of them are 28 feet long, and six are 17 feet 6 inches long.

These barracks are intended to accommodate 248 men and 266 horses. The cubic space per man varies from 443 to 541 feet, with the exception of six small rooms containing 24 men, in which the space is 676 cubic feet. These small rooms, although placed on the return as men's rooms, were occupied by non-commissioned officers.

The following table gives the details of accommodation :—

| Rooms. | Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |

| „ 15 | 8 | 7 | 1 |
| „ 16 | 8 | 7 | 1 |
| Total - 36 | 248 | 202 | 46 |

If all the barrack-rooms were occupied by men, there would be space for 202 men instead of 248. If, however, we deduct the accommodation in the 10 small rooms, which are in reality necessary for non-commissioned officers, the regulation accommodation for men will be 208, while the accommodation at 600 cubic feet per man will be sufficient for no more than

166 men, showing a deficiency of accommodation for 36 men.

It will be necessary to reduce the number of men per room from eight to six in all the eight-men rooms in the west and right wings, and from eight to seven in those of the left wing.

The whole of the rooms and corridors require ventilation.

The corridor of the west-wing range requires a plastered shaft the whole width of it, to be carried from its ceiling above the roof, to be covered above by a large ventilating skylight.

The right wing corridor has plastered shafts, but the ventilation by them is not sufficient, and requires to be increased at the skylights. The left wing requires similar shafts to be carried up at all the existing skylights over the corridor. Care should be taken to provide ample means of renewing the air at each skylight.

Every barrack-room should be separately ventilated by a shaft, inlet, and remodelled grate of the usual construction.

All the stables require ventilation by shafts carried from the corners above the ceilings.

The barracks are lighted with candles, although gas can be readily obtained.

There is a small school-room, and also a small library, both of which require ventilation like the barrack-rooms. There is no day-room.

The right and left wings have each a cook-house outside the buildings. One of them belonging to the right wing has boilers and an oven. The left wing cook-house has no oven. It ought to be supplied with one, as the existing oven is too far away from the men's rooms.

We are informed that before the oven was put up the men used to send their dinners to be cooked outside, at the cost of their vegetables.

Over the right wing kitchen is an ablution-room of recent construction, and entered from the stair leading down to the kitchen. This room is supplied with tables without ledges, and it has no ventilation. There is one bath. Beneath the stair is a dark passage and store, both very noisome, and such as ought not to exist in any barrack range. There was filth of the most offensive description in this passage at the time we were there.

The stairs leading down to the kitchens constitute the ventilating shafts of the kitchens, and convey damp foul air directly into the corridors, out of which the men's rooms are entered. To obviate this as far as practicable, the kitchens and staircases should be thoroughly ventilated, and a swing door should be placed at the entrance to the kitchen.

The water supply is derived from pumps, and also from a tank for storing rain water, If pipe-water can be obtained, it would be much better to lay it on.

One great defect in this barrack is the want of a proper system of drainage. It is true that there is the usual provision for removing surface water, but all the filth is retained in cesspits.

The privies are mere troughs, without proper drainage. In their present state they are too near the men's rooms to be safe.

These privies are in urgent need of improvement. They should be reconstructed on Macfarlane's principle, and their contents discharged into a cart for removal, in the manner adopted in Glasgow barracks, unless an outlet for the drainage can be obtained. In whatever way the sewage is disposed of, all the present cesspits should be abolished. The new latrines should be provided with divisions, half-doors, light, and ventilation.

There is a large wash-house in the arches under the west wing. It requires the usual fittings, and a drying closet.

At the end of this wing there is a manure pit close under the men's rooms. It should be reconstructed at a greater distance; raised above the ground, and the floor of it paved and drained.

There are no litter sheds connected with any of the ranges.

There is no shed for drill or exercise in wet weather, and no ball court.

The only accommodation for trades consists of two small rooms entered from the same corridor giving entrance to the men's rooms.

There are six cleaning-rooms, also off the corridors.

There is no accommodation for the families of married soldiers; but when the barracks are not fully occupied, they are permitted to use vacant rooms.

The best part of the barrack is an excellent new riding-school, which, however, requires ventilation through the roof.

There is a good serjeants' mess and kitchen at the end of the left wing.

The guard-room is tolerably good, and has a verandah. It requires the usual ventilation by a shaft and remodelled grate. There is no lock-up. There are three rather small cells entering from a passage beside the guard-room. They are defectively ventilated, and require shafts for the purpose.

The canteen is good and sufficient, but the tap-room requires an Arnott's ventilator and perforated panes.

Norwich barrack, as a whole, is far from being complete. Its defects are of the same general character as those of Ipswich barrack. After all that can be done for them the rooms in neither barrack will be good. It is therefore worthy of consideration whether these rooms might not be reconstructed on the plan of Hilsea barrack, which has been proposed to us for adoption in such barracks as those at Norwich and Ipswich. The rooms in Hilsea barracks go through and through the block, and are entered from an open outside corridor. The plan answers tolerably well in this instance. The distance between the opposite windows is 40 feet, and the rooms are 10 feet 7 inches in height, which is much higher than those at either Ipswich or Norwich. If with their present height the corridors were removed, and the rooms carried right across the ranges, there would be thorough ventilation; but the ceilings would be very low in proportion to the other dimensions of the rooms. To make the rooms what they should be, it would be necessary to raise the ceilings from two to three feet, to make them all at least 11 feet high, and to provide a sufficient number of properly hung windows. If this were done, and an outside corridor provided for entrance, both barracks would be very much improved, and rendered both more comfortable and more healthy.

In so far as regards the present buildings of Norwich barracks, *we would recommend as follows*:—

1. That the number of men in each room be reduced to the extent shown in the preceding table.
2. That the corridors be lighted and ventilated by square shafts, and ventilating skylights to the extent stated above.
3. That each room be ventilated by a shaft carried above the roof, and by an inlet, and remodelled grate.
4. Each stable to be ventilated by a shaft carried up from each corner above the roof.
5. The school-room, library, and workshops to be ventilated like the barrack-rooms.
6. The riding-school to be ventilated at the ridge.
7. The guard room to be ventilated by a shaft and remodelled grate, and the cells and passage to be ventilated by shafts.
8. Canteen tap-room to have an Arnott's valve and perforated panes for ventilation.
9. Cook-houses to be ventilated by shafts through the roof, and to have swing doors to the stairs leading up to the corridors. An additional oven to be provided.
10. Ablution-room to have a bead to the table, and to be ventilated.
11. Barrack to be drained to an outlet; all cesspits to be abolished; all privies to be reconstructed as

water latrines, and to have divisions of seats, half-doors, and light and ventilation. To be drained to an outlet, or their contents to be flushed into a water-tight cart, and removed once or twice a day.

12. Manure pits to be removed away from the vicinity of the men's rooms, and to be raised above the ground, paved, and drained.

13. Wash-house to be properly fitted up, and to have a drying closet.

14. Litter sheds to be provided.

15. Covered drill or exercising ground and a ball court to be provided.

*Norwich Cavalry Hospital.*

This hospital is constructed like an ordinary village house. It is two stories in height, with a passage and staircase in the middle, and wards and offices opening right and left out of them. It is situated between the end of the new riding-school and the lower boundary wall of the enclosure. It is open to the parade ground in front, and under one of its end walls an exercising ground for horses was being completed at the time we were there. We have had occasion in previous reports to point out similar gratuitous injury inflicted on hospitals by mere want of consideration. There is abundance of space for exercising horses within the barrack enclosure, and quite away from the hospital, and yet the exercising ground has been formed perhaps on the only spot of ground where it should on no account have been placed.

Of course either the exercising ground or the hospital must be removed.

The interior of the hospital is arranged in the usual manner. On either side the entrance there is the kitchen and serjeants' room, and beyond these is one small ward and the surgery. The floor of the ward is below the level of the ground. Half way up the staircase, out of the first landing, are two badly ventilated water-closets. On the upper floor are two small wards, and one large one extending the length of the front of the building.

In a small yard behind there is a small lean-to building, and a badly constructed privy.

The sick wards contain regulation space for 25 beds, at from 390 to 397 cubic feet per bed, exhibiting the maximum degree of overcrowding we have anywhere met with in hospitals.

The ground floor ward is 15 feet long by 13 feet 2 inches wide, and 9 feet 10 inches high. The large up-stairs ward is 37 feet 10 inches long, 17 feet wide, and 9 feet 2 inches high. The other two wards have the same height, and are each 15 feet 8 inches long by 13 feet 9 inches wide.

The following table shows the present accommodation in these wards, in contrast with what it ought to be, at 1,200 cubic feet per bed :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 5 | 1 | 4 |
| 2 | 5 | 1 | 4 |
| 3 | 10 | 5 | 5 |
| 4 | 5 | 1 | 4 |
| Total - | 25 | 8 | 17 |

The three smaller wards have each of them only 1,950 cubic feet of contents, an allowance too small for a single sick man in one small room. In such rooms the difficulty of ventilation is much greater than in large wards, and a much larger comparative amount of space is required.

None of the wards are ventilated. The only substitute for ventilation are openings over the doors into the passages, whereby the foul air of all parts of the building is permitted freely to distribute itself among the sick.

The wards require shafts, inlets, and remodelled grates, to renew and warm the air. The staircase should have a shaft carried through the roof, and perforated glass panes in the windows. As the kitchen is under one of the wards, it likewise requires a shaft to carry off the fumes of cooking.

There is no separate accommodation for orderlies, who have hence to sleep in the overcrowded wards among the sick.

Ordinary tallow candles are used for lighting. Ventilating gas-burners should be introduced into the wards and offices.

There is no proper lavatory and bath-room. Out of the kitchen there is a small scullery 3 feet 9 inches wide and 14 feet long, where washing up is done, and where the sick wash themselves in metal basins. There is no bath, except the ordinary slipper bath.

Water is derived from a pump in front of the hospital; and all the hospital drainage from privy, water-closets, slops, &c., flows into cesspits behind the hospital, and at no great distance from the well. There is an overflow pipe from the cesspits into the river, to give egress to the superfluous sewage which cannot escape into the subsoil.

Of course the fundamental remedy for these great defects is to drain the hospital, and to supply it with water along with the barracks.

The privy should be reconstructed as a water latrine.

A proper lavatory and bath-room, sunk basins, and a bath, with hot and cold water laid on, should also be provided.

There are no stores for either packs, provisions, bedding, clean linen or foul linen. There is only a cupboard under the stairs in which the packs are placed.

There is, of course, no accommodation for the sick of soldiers' families.

At the time the return was made to us there were no means of cooking diets except boiling. When roast meat was required it used to be prepared by the primitive expedient of thrusting a stick into the wall over the fire place, and attaching the meat to it by a worsted string. A proper oven has been recently provided.

It is difficult to deal with a building such as this, which is in reality a hospital only in name. By far the best thing to do would be to abandon the place altogether, and to build a proper hospital for the requisite number of beds.

If Norwich barrack is to be retained we should certainly advise this to be done.

*The present Building requires the following Improvements :—*

1. The number of beds to be reduced from 25 to 8 and the hospital to be extended, to afford space for 17 beds at 1,200 cubic feet each.

2. All the wards to be ventilated by shafts, inlets, and remodelled grates. Staircase to be ventilated by a shaft through the roof and perforated glass panes.

Kitchen to be ventilated by a shaft.

Water-closets to be thoroughly ventilated by shafts and inlets.

3. Hospital to be drained, and supplied with water along with the barrack; all cesspits to be cleaned out, filled up, and abolished. Privy to be converted into a water latrine.

4. Ablution and bath room, with sunk basins, a bath, and hot and cold water laid on, to be provided.

5. Gas to be laid on, and ventilated gas-burners introduced into the wards and offices.

6. Orderlies' room to be provided.

7. Stores to be provided.

8. Manège for horses to be removed away from the hospital. Earth to be dug away from the back of the hospital, and the ground to be lowered a foot below the level of the ground floor ward.

9. A proper enclosed exercising ground for convalescents to be provided.

A moment's consideration of the nature and cost of these improvements will show that a new hospital should be constructed with as little delay as possible, unless the station is to be given up.

### 6. Ipswich Cavalry Barrack.

This barrack is situated in an open, healthy position at the outskirts of the town of Ipswich.

It consists of a central block containing officers' quarters, and of two detached wings built at right angles to it, in which are the stables with soldiers' rooms over them. Between the line of the officers' quarters and the boundary wall is the riding-school, beside which are stores. On the same line, close to the boundary wall, is the hospital.

Down one side of the parade ground there is a row of workshops and other buildings, at the end of which, nearest the gate, is situated the guard-room and prison cells. The buildings are on the whole well arranged for external ventilation, except the hospital, which is in a corner, and in too close proximity to the stables.

The blocks containing men's rooms are of the usual construction of cavalry barracks. A long, dark, imperfectly ventilated inner passage extends the whole length of each block, out of which the rooms enter right and left. There is a window at each end of the passage in the east wing, but in the west wing both ends of the passage are blocked up by the school-room and barrack-serjeant's quarters, by which both light and ventilation are effectually cut off from the interior of the wing. There are two or three gratings in the ceiling of each passage corresponding to skylights in the roof of the attic. Access to the passage is obtained by two wooden staircases passing up between the stables.

There are 12 soldiers' rooms in one range and 10 in the other. They are all the same height, namely, 8 feet 1 inch, and they are all 16 feet wide. Four rooms are 21 feet 8 inches long. All the remaining rooms are 28 feet long.

None of them are very good rooms. They are too low in the ceiling. Seven of them have two windows each. The remaining 15 rooms have one window each.

The space per man varies from 452 to 459 cubic feet.

The following table gives the details :

| Rooms. | Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |

By removing two men out of each of the eight-men rooms, the remaining six men will have as nearly as may be 600 cubic feet per man, and by removing one man out of every six-men room the remaining five men will have less than 600 cubic feet each. If two men were removed there would be a considerable excess of space ; we have therefore left a man in each room instead of removing him. There are only four of these rooms altogether.

There are eight serjeants' rooms and two staff serjeants' rooms in the ranges, and several of the men's rooms are used as married quarters.

There are attics above the men's rooms, part of which are intended for occupation by men, but in their present state they are not adapted for such a purpose. The only ventilation for the barrack-rooms is by openings in the ceilings communicating with these attics. They are all warmed by the old pattern grate.

The main improvement required for these barrack-ranges is ventilation, beginning with the stables. From the four corners of each stable a shaft should be carried up above the roof to free the men's rooms as far as practicable from ammoniacal fumes and foul air.

Each room should also be ventilated by a shaft carried up from a corner of the ceiling opposite the fire-place to above the roof. One inlet for fresh air over the window will be sufficient. A remodelled fire-grate should also be introduced for warming part of the air.

The corridors should be lighted and ventilated by carrying up shafts the square of their breadth, through the attic to the roof. The shaft should be plastered inside, and should have a ventilating skylight in the roof at its upper end.

All the non-commissioned officers' rooms should have Arnott's valves and remodelled grates.

The barrack-rooms are lighted by candles at night, although there is gas laid on within the enclosure. All the rooms should have burners. There is a school-room, used also as a library. It requires ventilation in the same way as the barrack-rooms.

Along the wall at the rear of each wing are two shed ablution-rooms, 16 feet long and 9 feet wide. They have wooden washing benches, with beads, gratings, and pegs.

Recently, part of the ablution-room has been partially cut off from the remainder to accommodate a bath. The space is very restricted, and the division is not high enough. This division should be made more complete, and each ablution-room should have a louvre in the roof for ventilation. Each wing of the barracks is provided with a cookhouse and larder, opening out the passage at the foot of the stair leading up to the rooms. They are fitted up with the ordinary barrack boiler set in the usual way. One of them has a large brick oven for cooking rations. These cook-houses, being under the men's rooms, should each have a shaft carried from its ceiling above the roof, for ventilation.

Water is supplied partly from the company's mains, partly from pumps, of which there are four.

The pump water in two of the wells is apt to become scarce in dry weather. It is stated to be good, but the water which we ourselves examined, drawn from one of the pumps opposite the stables, was no better than diluted sewage, and quite unfit for any purpose whatever.

We need hardly repeat here, what we have often said before, as to the bad quality of the water drawn from superficial wells within undrained barrack enclosures. In porous soils the well becomes in fact the drainage outlet for the area, and all the impurities of the subsoil gravitate towards it.

The surface water is said to be removed by a barrel drain, but there is no drainage in the proper sense of the term.

The privies are of the usual barrack construction, connected with cesspits, which are cleansed occasion-

ally. There is only very limited privy accommodation for non-commissioned officers and soldiers, and none for women or children.

The accommodation requires to be extended, and the privies reconstructed as water latrines on Macfarlane's principle. They should have divisions and half-doors, and the buildings should be thoroughly lighted and ventilated. To enable these privies to be reconstructed there must be a drainage outlet. At present the surface drainage is passed into a millpond, and thence into the river Orwell; but, if the latrines were drained, some less exceptionable outlet would have to be provided, either directly into the river, or by the application of the sewage matter to agricultural purposes. If no such outlet be available, we would advise that a water-tight cart be provided, into which the latrine can be flushed, and the sewage carted away once or oftener every day. Behind the privies is a deep manure pit. This should be improved in the usual way, by raising it above the level of the ground, and paving and draining it.

There is a wash-house, but it is of little use, on account of the want of proper fittings. It requires fixed tubs, a drying closet, and roof ventilation.

The workshops, already referred to, consist of a master tailor's and tailors' shop, and shops for shoemakers, saddlers, and armourers. They appear to be sufficient and convenient, but require ventilation through the roof.

The riding-school is very low in the roof, although it has sufficient light and ventilation.

There is a good guard-room, but it requires ventilation by a shaft and remodelled grates. Adjoining the guard-room there are two cells, and there is another prison with four cells. One cell has about 1,200 cubic feet of contents, but all the others are much smaller; four of them have about 600 cubic feet each. They are all warmed and partly ventilated, but require more air within the passage.

The canteen is tolerably good, but the tap-room is rather dark, and requires an Arnott's valve and perforated panes for ventilation.

Ipswich barracks are deficient in the following points:—

There is no day-room, lock-up, cleaning-room, nor ball court. There are no litter sheds.

The magazine is close to the boundary wall and to dwelling-houses.

*The following are the Sanitary Improvements required:—*

1. Reduction of the numbers of men in each barrack-room to the extent shown in the preceding table.

2. Ventilation of each barrack-room by a shaft carried from the ceiling above the roof, and by an inlet and ventilating grate.

3. Obstructions at the ends of the corridor in the west wing to be removed, and windows to be opened at each end. Two shafts, plastered inside and covered with ventilating skylights, to be carried up in the length of each corridor.

4. Stables to be ventilated by a shaft carried from each corner above the roof.

5. Each cook-house to be ventilated by a shaft carried above the roof.

6. Ablution-rooms to have a louvre in the roof for ventilation. Bath to be better divided off from the ablution-room.

7. Gas to be laid on to the barrack-rooms.

8. Drainage to be improved. Privies to be reconstructed as water latrines, with divisions, half-doors, light, and ventilation. The sewage to be disposed of in one of the ways mentioned above. Latrine accommodation to be extended, and separate latrines for women and children to be provided. All cesspits to be cleaned out and abolished.

9. Manure and ash-pits to be raised above the level of the ground, and the surface paved and drained.

10. Women's wash-house to be properly fitted up and ventilated.

11. Workshops to be ventilated by shafts and inlets.

12. Guard-room to be ventilated by a shaft, and remodelled grate. Cells to be better ventilated, especially the passages. Guard-room privy to be made into a water latrine, and the cesspit abolished.

13. Canteen tap to have an Arnott's valve and perforated glass panes.

*Ipswich Cavalry Hospital.*

This is a small building, like a common village house. It has two floors, and a through-and-through flagged passage and a wooden staircase.

On the ground floor are the surgery, serjeants' room, kitchen, and one ward; and there are three wards on the floor above.

The upper wards are only 9 feet 5 inches high. The lower ward is 10 feet high. Three of the wards are 13 feet 3 inches wide and 17 feet long. The largest ward, which occupies the breadth of the hospital upstairs, is 37 feet 10 inches long and 17 feet wide.

The total accommodation is intended for 24 beds, at from 485 to 563 cubic feet per bed. There are 12 beds out of 24 with the smaller of these amounts.

The following table gives the details of the ward accommodation:—

| Wards. | Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| No. 2 | 4 | 2 | 2 |
| „ 5 | 4 | 2 | 2 |
| „ 6 | 12 | 5 | 7 |
| „ 8 | 4 | 2 | 2 |
| Total - | 24 | 11 | 13 |

None of the 11 beds we have given as the available accommodation at 1,200 cubic feet per bed have that amount of space. Properly speaking, the three smaller wards ought to hold one bed each, and no more; but we have placed two in each, on account of the small number, 11 beds, which the building would contain.

The wards are all very inferior in character. They are complained of as being cold and gusty, without being ventilated. The doors fit badly. The fire-grates are large and wasteful, and the building, as a whole, would be better adapted for married quarters, or for some similar purpose, than for its present object.

Besides reducing the number of beds, we would recommend that each ward be ventilated by a shaft, inlet, and remodelled fire-grate. The staircase should also be ventilated through the roof.

There is no accommodation for orderlies. Gas should be introduced to the wards and other rooms.

There is no ablution or bathing accommodation, except a slipper bath, kept in the dead house.

The wash-house requires a louvre in the roof.

The kitchen is properly a ward of the hospital. It is under a sick ward. It has defective means of cooking.

Water is laid on to the hospital from the town mains.

There is no drainage, all the waste water and all the refuse of privies and water-closets pass into cesspits, one of which is directly under the back wall of the hospital at the back door. This cesspit is only covered with boards within the privy, and has to be cleansed by raising the boards inside the privy. This work has only been recently done. A water-closet opening out of a gallery from the top flat has also recently been constructed; it discharges into the cesspit below. The ground floor wards are close to the cesspits.

There is neither pack store, provision store, nor bedding store. A four-bed ward is misappropriated as a pack store. There is no enclosure in front of the building. The only enclosed exercising ground is behind the hospital where the cesspits are.

If this hospital is to be used in future it must be drained and the cesspits abolished. The privies must also be converted into water latrines.

Such additional accommodation and conveniences as are required to make it suitable for its object ought to be provided; but it would be much better to build another hospital, and, after improving the sanitary condition of the building, to use the present one for increasing the barrack accommodation.

*The Sanitary Improvements immediately required are as follow:—*

1. Reduction of the number of beds to the extent shown in the table.
2. Ventilation of the wards by shafts, inlets, and remodelled grates; ventilation of the staircase through the roof; ventilation of the kitchen by a shaft; ventilation of the serjeants' room by an Arnott's valve.
3. Gas to be introduced.
4. Ablution and bath-room to be provided.
5. Wash-house to be ventilated.
6. Hospital to be drained along with the barrack. Cesspits to be abolished, and water latrines substituted for privies.
7. Additional stores to be provided.
8. An enclosure to be provided in front of the hospital.

July 1861. JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

The Right Hon. the Secretary of State for War.

# BIRMINGHAM DISTRICT.

SIR,

WE have the honour to transmit to you the following report on barracks and hospitals in Birmingham district, with the recommendations we have thought it necessary to make for improving their sanitary condition.

The barracks and hospitals we have examined in this district are:—

I. Birmingham cavalry.
II. Coventry. „
III. Northampton artillery.
IV. Weedon cavalry and infantry.

## I.—BIRMINGHAM.

### CAVALRY BARRACK.

This barrack is built on leasehold ground, about 16 years of the lease of which are unexpired. The site was originally a country one, but is now closely surrounded by streets and buildings. The ground has a rapid fall from the entrance to the lower part of the boundary wall, and in erecting the buildings advantage has been taken of the slope to divide it into two separate portions on different levels. On the higher part are constructed the barrack buildings and parade ground; on the lower are the barrack offices, out-houses, workshops, canteen, &c., which are built on the sides of a space laid out as the cavalry exercising ground.

The total area within the boundary wall is 5A. 2R. 6P.

The subsoil is gravelly, and most of it admits of drainage; but the lower part of the cavalry exercising ground is covered with mud in wet weather, partly on account of its receiving the drainage of the higher portion of the slope, and partly from the loamy nature of the ground, which becomes worked into a plastic material by the horses' feet. To obviate this defect as far as practicable, it is found necessary to remove the surface from time to time. The evil could be remedied by subsoil drainage, for which there is a sufficient fall and outlet.

The barracks are arranged in two half squares, one of which, opposite the entrance gate, is formed by the officers' quarters, hospital, riding house, guard-room, cells, &c. The other half square is formed by the same range of officers' quarters, and by two ranges of stables, with barrack-rooms over them. This half square overlooks the exercising ground, and forms three sides of the upper parade ground already mentioned.

Each range of stables and barrack-rooms is about 60 yards in length, and two stories high. The barrack-rooms are reached by a stone staircase carried up in the middle of the length of the range, giving access to a long corridor 5 feet 8 inches wide, and 10 feet high, running from end to end of the building, out of which corridor the men's rooms enter right and left. The only light supplied to these corridors is by a half glass door at each end, and by a small window in the staircase.

The soldiers' rooms are all of a size. They are about 28 feet long by 16 feet 9 inches broad, and 10 feet high.

The total accommodation in the men's rooms, according to present regulation, is for 180 men, with about 515 cubic feet per man.

There are seven non-commissioned officers' rooms, with accommodation in them for 12 men. The following table gives the accommodation in the men's rooms as compared with what it would be at 600 cubic feet per man:—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 20 | 180 | 160 | 20 |

The present number of men per room is nine. If the number were reduced to seven it would afford more space than 600 cubic feet. By reducing the number to eight men per room, a little less than 600 cubic feet will be given.

We recommend, then, that the number of men in each room be reduced from nine to eight.

Each room has one long low window, no more than 3 feet 2 inches high, while the breadth is 8 feet 8 inches. This form of window has the great disadvantage of leaving a large unlighted and unventilated space above it, and as it is generally placed near one end of the room it leaves the other end in obscurity. The windows open by sliding.

In this, as in other similarly constructed barracks, it would be very advisable to open a window in the dark end of the room.

Provision is made for ventilating each room by two air bricks placed close to the ceiling at the dark end; but there are no outlets for foul air except by a sliding shutter over the door, which opens into the corridor, and as the corridor itself is unventilated, this opening cannot properly be considered as an outlet. Each room should have a separate outlet shaft carried from the ceiling to above the roof, and the two air-bricks could be used as inlets by covering both of them by a cornice of perforated zinc of the usual construction. The sliding shutter over each door should be removed, and the space filled with panes of perforated glass, which would permit a freer circulation of air, and admit some light to the corridor.

The corridor itself requires both light and ventilation. The readiest way of effecting this would be to carry up two square shafts the entire breadth of the corridor from its ceiling to the ridge, to cover the shafts at the ridge by ventilating skylights, and to

plaster the shafts inside. These shafts should be placed about midway between each end window of the corridor and the centre.

Further to improve the ventilation of the corridor, we would recommend that perforated glass panes be placed in the upper row of the windows at the ends of the corridors, and in the staircases.

The barrack-rooms are warmed by small grates, resembling those in use in ordinary cottage rooms. We should propose to remodel these grates to warm part of the admitted air. In these barrack-rooms, as in others of similar construction, the door is placed close to the fireplace, an arrangement which ought always to be avoided, on account of its interfering injuriously with the warmth and ventilation of the room, and the comfort of the men. In the present case it would be a great improvement to remove the doors to the opposite ends of the rooms, which could be easily done, as the wall of the rooms on the side next the corridor is of wood.

The non-commissioned officers' rooms are at the ends of the corridors. They should each have a silk-flap ventilator placed in the chimney. A similar ventilator should also be put into the chimney of the library.

The serjeants' mess-room is not ventilated. It is used for cooking, and also as a sleeping room for the mess cook. It should have a shaft and inlets, like the men's rooms.

The stables are each provided with eight inlets for air, close to the ceiling, but these are not sufficient to prevent the stable effluvia passing through the ceiling to the barrack-rooms. We would recommend that each stable should have four shafts carried up from the ceiling to above the roof, one from each corner, the united area of the four shafts being equal to 12 square inches per horse. The shafts should be lined inside with carefully soldered zinc, to prevent escape of effluvia into the barrack-rooms. The stables are rather dark, and might advantageously be provided with more window space.

There are no litter sheds, and the litter has to be spread out directly under the barrack-room windows. Proper sheds, at a short distance from the front of the buildings, should be provided.

Each barrack-room is lighted with gas, but the burners require ventilating funnels and tubes carried into the chimney.

It has been already stated that the ground on which these barracks stand is on two levels. One end of each barrack range overlooks the lower level, and is supported upon an arched basement underneath each end stable. There are two of these arches, one under the end of each range. They are reached by descending two or three steps below the level of the lower parade ground, and are provided with a half glass door, affording light to the interior. In these arches are placed the ablution-rooms belonging to the barracks. They are small, low in the roof, dark, damp, and unventilated; and it is difficult to see how these defects can be obviated. They are distant from the barrack-rooms, and on all these accounts cannot be used without risk to the health of the men.

The water tanks for supplying them are under one end of the arch. They have no gratings nor pegs. There are slate ablution tables, but the tables have no ledges. Water for the cisterns is derived from the barrack roofs; and when the supply runs short, the men have to carry water from pumps at a distance. Altogether, the arrangements of these ablution houses are so defective that the men prefer washing in a bucket in the stables.

There are no baths, and no room to place them in.

This is clearly a case in which ablution-rooms should be built. They should be properly supplied with water, have tables with ledges, gratings, and pegs. They should be properly lighted and ventilated, and have a space cut off in each for a bath, with water laid on.

Along one side of the lower parade ground is a range of one-story buildings, containing the school-rooms, cook house, women's wash-house, latrines, &c.

The school-room is close to one of the ablution-rooms. It has windows on one side, and no means of ventilation. It should have a shaft carried up from the ceiling to above the roof, and inlets of the usual construction.

Adjoining the school-room is the women's wash-house. It has two boilers with brick washing benches, and is lighted by a skylight. It has no water laid on, is not ventilated, and has no means of drying or getting up linen. It should be provided with fixed tubs and water laid on, gratings for the feet, a louvre in the roof for ventilation, and a proper drying stove and ironing table.

Next the wash-house is a very good kitchen, light, roomy, well ventilated, and clean. It has nine boilers, and an excellent brick oven of a construction common in the district, and one stated to be well adapted for its purpose. It can roast or bake half the rations. Altogether this is one of the best barrack kitchens we have seen.

It would, however, effect an economy in the expenditure of fuel, if one fire-grate were constructed for each two boilers, instead of one grate for each boiler, as in the present arrangement.

There are two manure heaps on opposite sides of the lower parade ground, one of which and an ash-pit adjoins the cook house. Both are placed at a considerable distance from barrack-rooms, but they are not well constructed, as they are dug out below the level of the ground. We would recommend that both manure heaps and ash-pit be filled up to the level and properly paved and drained. There is another ash-pit behind the hospital and close to the men's barrack-rooms. The situation is a bad one, although the ground is paved. It would be much better in this instance to clear away the ash-pit and substitute an iron cart for receiving the barrack and hospital refuse.

These barracks are provided with water latrines, but they have no proper divisions, and there is no space for half-doors. The only improvement we would suggest in them would be to provide them with proper seating and divisions, and that, instead of the present precarious method of supplying them with water by pumping, a constant water supply be provided.

Adjoining the canteen and tailor's shop there are two small latrines connected with cesspits. These should be reconstructed, supplied with water, drained, and the cesspits filled up.

All the buildings are drained into the town sewers, but the surface gratings are not all trapped. This defect should be remedied.

Water is obtained from pump wells and from the barrack roofs. The plan of supplying water from the subsoil drainage of town districts, such as this, is always a bad one, and as water can be obtained from the town mains we would recommend this to be done at once.

At the lower end of the parade ground is a building, formerly used as a hospital, in which are situated the quartermaster's stores and tailor's shop. The latter requires ventilation by a shaft and inlet.

At a short distance from this building is the forge, which is complained of as being too small.

The canteen occupies a one-story range of buildings on the side of the lower parade ground opposite the cook-house. The rooms are very low in the roof, and are not ventilated. We would advise a silk flap ventilator to be placed in each chimney close to the ceiling; that each gas-burner should be provided with a ventilating funnel and tube into the chimney, and that each window should have a pane of perforated glass put into the upper row of panes. Both the tap-room and non-commissioned officer's room should be ventilated in this way.

On the slope below the canteen is situated the infirmary stables, with a very small and inconvenient surgery attached.

Near the entrance gate, on the left-hand side, is the riding house. It is very dark and damp, and not sufficiently ventilated. It should have four large skylights in the roof, 4 feet by 8 feet each, and louvres in the ridge for ventilation.

The provost's establishment, which is opposite the riding school, has no kitchen, the prisoners' cooking being all done at the grate in the provost serjeant's room. There are four cells facing the barrack square, with a narrow dark passage running along behind for communicating with the cells. This passage is warmed by a stove at one end, and at the opposite end of the passage is placed a dark water-closet without any sufficient ventilation. The effluvia from this water-closet could be detected in the passage. The space should be lighted and ventilated, and cut off by a door from the rest of the passage.

The guard-room requires a shaft and inlet for ventilation, and a remodelled grate for warming part of the air. The cells behind the guard-room should have a small shaft, with an area of six or eight square inches, carried up from the ceiling for ventilation.

This barrack has no day-room nor cleaning room, and no accommodation for married soldiers except in the barrack-rooms.

*The following are the Sanitary Improvements we would advise to be carried out:—*

1. Reducing the number of men per room from nine to eight.
2. Lighting and ventilating the corridor by two shafts and ventilating skylights, as described, and by perforated glass panes in the corridor and staircase windows.
3. Ventilating the men's rooms by a shaft carried from the ceiling of each room to above the roof, and by a perforated zinc cornice placed over the present inlets. Fire grates to be remodelled to warm part of the admitted air. Perforated glass panes to be placed over the present doors. An additional window to be opened at the dark end of each room, and the doors to be removed to the opposite ends of the rooms. A ventilating funnel and tube to be provided for each gas-burner.
4. Non-commissioned officers' rooms and the library to be ventilated by silk-flap ventilators into the chimneys. School-room to be ventilated by a shaft and inlets like the barrack-rooms. Tailor's shop to be ventilated by a shaft and inlet. Canteen tap-room and non-commissioned officers' room to be ventilated by silk flap ventilators and by perforated glass panes in the upper window sashes. Guard-room to be ventilated by a shaft and inlets, and to have a remodelled grate. Guard-room cells to be ventilated by a shaft through the roof. Non-commissioned officers' mess room to be ventilated by a shaft and inlet.
5. Stables to be ventilated by a shaft from each corner, as described, and to have additional window space. Riding school to have skylights in the roof, and louvres in the ridge for ventilation. Stables to be provided with litter sheds, and the ground in front of the stable doors, when repaving is required, to be paved with square setts.
6. Water to be obtained from the town mains.
7. Two new ablution houses, suitably provided with lavatory arrangements, and one bath in each, with water laid on, to be erected instead of the present ablution houses.
8. Latrines to have proper seats with divisions. The privies at the tailor's shop and canteen to be drained, converted into water latrines, and the cesspits filled up. Lower end of the parade ground to be drained.
9. Women's wash-house to be ventilated by a louvre, to have fixed tubs with water laid on, a drying stove, and means of ironing linen.
10. Manure heaps and ash-pit beside the lower parade ground to be filled up to the level of the ground, paved, and drained. Ash-pit behind the hospital to be abolished, and an iron cart substituted.

*Birmingham Barrack Hospital.*

This hospital consists of a small brick building situated in the parade ground fronting the entrance gate of the barrack, close to the officers' quarter, and at the end of one of the stable ranges. It is constructed on the plan usually adopted for regimental hospitals, and has a central passage and staircase with the wards and offices opening right and left out of them. The building is two stories high. It has no enclosure, but opens directly on the parade ground. Behind it there is a small back yard, containing the latrines, dead-house, &c. A verandah has been carried round two sides of this court to afford a covered access to the outbuildings, and as the roof of the verandah is not glazed, it darkens one of the wards. This defect could be removed by making the roof of the verandah of glass where it crosses above the ward window. The ground floor of the hospital contains the surgery, also used as a provision store, the hospital-serjeant's room, the kitchen, and one small ward. On the flat above are, one large ward running from front to back of the building, one small ward with windows on one side, and a store.

The total regulation accommodation is for 20 beds, but the wards are very much overcrowded, as will be seen from the following table :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet per Bed. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 5 | 2 | 3 |
| 2 | 5 | 3 | 2 |
| 3 | 10 | 5 | 5 |
| Total - | 20 | 10 | 10 |

The present wards will accommodate 10 sick at considerably less than 1,200 cubic feet per bed. The building does not admit of extension ; and even if it did, we should scruple to recommend such a step, considering the short period the lease has to run. Additional ward space might be found by removing the store on the upper flat of the hospital. It is possible also that space might be found for constructing a small detached kitchen. Were this done, another room would be added to the ward space. All the present wards are ventilated by Sheringham's ventilators, but they are not sufficient. In the two smaller wards, Nos. 1 and 2, we would propose to improve the ventilation by inserting a silk flap ventilator into each chimney, but in the large ward, No. 3, it will be necessary to carry a ventilating shaft through the roof of the building. It would further improve the ventilation of the whole building to alter the windows over the passage door, by making them turn on pivots, and by inserting panes of perforated glass in the upper sash of the stair windows.

We would also advise remodelled fire grates to be introduced instead of the present ones. There is a gaslight in each ward, but the burners have no means of ventilation ; and we would recommend a ventilating funnel and tube to be provided for each.

This hospital has neither lavatory nor bath-room. The patients wash under the verandah in the hospital yard, and the only means of bathing is a slipper bath and a shower bath kept in the back yard. The dead-house is sometimes used as a bath-room.

The kitchen is properly supplied with the means of cooking, but it requires ventilation by a shaft 12 inches square, carried above the roof of the building.

Water is obtained from a pump in the hospital yard, a means of supply open to the objections already stated in regard to the barrack supply. Water should be laid on to the hospital as well as the barrack. There is no water-closet within the hospital.

There is a small narrow water latrine in the yard behind, to which the patients obtain access by the verandah. The accommodation is certainly not all that could be desired, but there is no space to provide better. The present latrine might be improved by a skylight.

*The Sanitary Improvements we would recommend for this Hospital are the following:—*

1. Reduction of numbers of sick in the existing wards to the extent stated, and providing additional ward space by removing the store from the upper floor, and, if possible, the kitchen to a detached building.

2. Ventilating the passage and staircase, by altering the windows, and by perforated panes, as described. Introducing a silk flap ventilator into the chimney of each smaller ward, and a ventilating shaft into the larger ward. Ventilating the kitchen by a shaft carried from the ceiling to above the roof.

3. Providing, if possible, a small bath-room and ablution-room, with hot and cold water laid on, and a covered communication from the hospital.

4. Glazing the roof of the verandah where it passes over the ward window. Lighting the latrine by a skylight.

## II.—COVENTRY.

### Cavalry Barracks.

These barracks are situate at the western extremity of the town of Coventry, within an enclosure 3A. 2R. 29P. in area, and are closely surrounded on three sides by houses. On the fourth side they are bounded by a common, across which an open ditch passes, receiving the sewage of the town. They were originally an old inn, with its stables, and were purchased and occupied as barracks about the year 1792. The inn itself is now used as officers' quarters, and the soldiers' rooms were formerly lofts over the stables and outhouses. There are three separate sets of barrack-rooms; two of these are over stables, and are reached by stone staircases, from the top of which galleries or corridors with windows on one side run along the range, and afford access to the men's rooms. The windows of these galleries overlook private property, and the light which would otherwise be derived from them, is materially diminished by slanting boards, placed to prevent the men looking out. The windows do not admit of being fully opened, and cannot be properly cleaned. This defect should be remedied. The third set of rooms is entered from an outside wooden gallery, and are chiefly occupied as married quarters, school-room, barrack offices, &c. A portion of the barrack-rooms look over the open ground, but others have their windows opening into the narrow back alley which formerly led into the inn yard. In one corner of this alley are placed the water-closets belonging to the officers' quarters, with a water cistern over them. They are badly constructed, and placed so that they are a nuisance at times to the rooms above. A similar nuisance arises from a urinal in the opposite corner of the alley. Both water-closets and urinal should be removed, and reconstructed elsewhere.

A number of buildings have been added at different periods to the old inn offices, such as the hospital, cook-house, lavatory, workshops, guard-room, riding house, &c. These buildings are situated round the open area of the parade ground.

There are 17 soldiers' rooms over the different ranges of stables. With one or two exceptions they are from 25 to 28 feet long; they vary in breadth from 19 to 26 feet, and they are from 9 feet 6 inches to 10 feet 6 inches high. Three only of them have two windows, and all the others have one window per room. The total regulation accommodation is for 201 non-commissioned officers and men, the details of which, as regards the men's rooms, are as follow:—

| Rooms. | Regulation Number of Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 10 | 9 | 1 |
| 2 | 12 | 10 | 2 |
| 4 | 18 | 13 | 5 |
| 5 | 5 | 5 | — |
| 6 | 13 | 11 | 2 |
| 7 | 12 | 9 | 3 |
| 8 | 12 | 9 | 3 |
| 9 | 12 | 9 | 3 |
| 10 | 13 | 10 | 3 |
| 11 | 12 | 9 | 3 |
| 12 | 12 | 9 | 3 |
| 13 | 12 | 9 | 3 |
| 14 | 12 | 8 | 4 |
| 15 | 12 | 8 | 4 |
| 16 | 12 | 8 | 4 |
| 17 | 13 | 9 | 4 |
| Total - - | 192 | 145 | 47 |

These rooms ought to hold at the outside 145 men, and 47 is the number for which additional accommodation should be provided.

The buildings are old and very badly arranged for barrack purposes. The appear to have been originally appropriated only temporarily, and the occupation has become permanent, while the buildings are evidently unsuitable for such a purpose. The men's rooms are saturated with ammonia from the stables, and would require thorough scraping, limewashing, and ventilation to purify them. Each room has openings through the ceiling into the roof, but they are insufficient for ventilation. There are, besides, square openings over the doors into the passages; but these openings are provided with louvres, which are turned the wrong way, so that any air passing through them is thrown down upon the men in place of being carried towards the ceiling. We would propose to remedy the defects in the ventilation by carrying a shaft from the centre of the ceiling of each room to above the ridge of the roof, and by an inlet for air of the usual construction in the outer wall, opening within the room, close to the ceiling, and covered with a perforated zinc cornice.

The louvre over the door should be reversed to throw the air up, and panes of perforated glass should be placed in the upper row of each of the passage windows. The fire-grates in all the rooms should, at the same time, be remodelled to warm part of the admitted air.

The ventilation of the stables is also defective, and some of them have no opening at the back.

Additional light should be given to these stables by enlarging existing windows where practicable, and the stables should be ventilated by carrying a shaft from each corner above the roof. These shafts should have a conjoint area equal to 12 square inches per horse, and should be carefully lined with soldered zinc.

The serjeants' rooms are very close, and have no ventilation. The room occupied by married soldiers should be ventilated like the barrack-rooms. The serjeants' mess and the library and school-room are both dark, and require ventilation like the barrack-rooms. Additional light might be given to these rooms by skylights.

These barracks are not supplied with gas, although this could be readily done. One gas-burner should be introduced into each barrack-room; and if placed under the foul-air shaft, it would be sufficiently ventilated without the usual tube and funnel.

There is a good detached ablution-room, with a water tank filled by a force pump, and an ablution table and basins. The table has no bead, and gratings are required for the men to stand on, and pegs for hanging coats.

Additional light should be given through the roof.

There is a space partitioned off from the ablution-room, apparently intended for bathing, but there are no baths. Two baths should be provided, with water laid on.

There is a wash-house with two boilers; it is a small, low-roofed, dark, and unventilated room under the serjeants' mess. It has no fixed tubs, gratings, water, nor means of drying and getting up linen. It could be improved in every thing except the lighting, but it is questionable whether it would not be cheaper to build a proper wash-house.

There is a good cook-house supplied with boilers and a brick oven recently erected. The boilers, however, are very old and have divisions in them; they are set in pairs, with one large fire to two boilers, but are not economical, as they consume 18 cwt. of coal per week for 150 men.

A row of workshops has been constructed along one side of the barrack enclosure; they all require ventilation through the roof, and inlets for air.

The riding house is ventilated, but is dark, and requires two skylights, 8 feet by 4 feet, in the roof.

The canteen tap-room requires ventilation by a silk flap ventilator in the chimney, and by perforated glass panes in the windows.

Ventilation by a shaft and inlet and a remodelled grate are required for the guard-room. There are four cells opening out of a passage from the guard-room. They are very dark on account of the windows being painted to prevent persons looking through. Ribbed glass, which answers the same purpose while it admits light, should be substituted for the present glazing.

The barracks are supplied with water from wells sunk in the yard. This method of supply is open to the usual objections, and should be discontinued. The town water should be laid on instead.

The barrack and enclosure are surface drained to an outlet passing under the manure heap. A few of the drains only are trapped. All the privies require drainage and reconstruction as water latrines, with divisions of seats, half-doors, light, and ventilation. It was stated that the main drain of Coventry passes through the barrack square. If so, an outlet can be at once obtained, and all the cesspits should be abolished. The manure heap and ash-pit are both together. They are of the usual defective construction, and sunk below the level. They should be raised at least to the level of the ground, paved, and drained; all ash-pits should be covered, and arrangements should be made for the daily removal of the whole manure and refuse.

Coventry barracks are in many respects so defective that nothing short of their re-construction can make them what they ought to be as regards the health and comfort of the men. The whole of the old inn stables and outhouses should be cleared away, and suitable barracks and stables for the force erected instead. *In the meantime, however, we would recommend the following sanitary improvements to be carried out:—*

1. Reduction of numbers of men in each room to the extent stated.

2. Ventilation of each barrack-room, married soldiers' room, non-commissioned officers' mess-room, guard-room, workshops, and the library and school-room, by a shaft carried from the centre of the ceiling to above the roof, and by an inlet for air; the louvres opening from the barrack-rooms into the passage to be reversed, and perforated glass panes to be put in the passage windows. Barrack-room and guard-room grates to be remodelled.

3. Stables to be ventilated by a shaft lined with zinc, carried from each corner to above the roof. Additional light to be given to the stables where practicable. Riding school to have two skylights in the roof.

4. A gas-burner to be introduced into each barrack-room.

5. Ablution-room to have a bead put to the table. Gratings and pegs to be provided. Two baths, with water laid on, to be placed in the recess, and a skylight to be put in the roof.

6. Women's wash-house to have fixed tubs, with water laid on, and a drying and laundry stove.

7. Water to be laid on over the barrack, from the town water supply.

8. Privies to be drained and reconstructed as water latrines, with divisions, half-doors, light, and ventilation, and the cesspits abolished. Manure heap and ash-pit to be filled up to the level, paved, and drained, and provision to be made for the daily removal of manure and refuse. All drains to be trapped.

### *Coventry Barrack Hospital.*

This hospital is a small detached two-story building, situated at the lowest side of the parade ground. It has no separate enclosure, except a small narrow yard at one end, in which is placed the privy, dead house, &c.

On the lower floor are situated the surgery, kitchen, and one large ward with three windows on each of the two opposite sides, and one large window at one end. The upper floor is reached by a spacious light staircase, and contains a large ward similar to the one below, a small ward, and a serjeant's room. The total accommodation is for 23 beds, the details of which are given in the following table:—

| Wards. | Present Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency in Bed Spaces. |
|---|---|---|---|
| No. 1 - - | 11 | 9 | 2 |
| „ 2 - - | 11 | 9 | 2 |
| „ 3 - - | 1 | 1 | — |
| Total - - | 23 | 19 | 4 |

At less than 1,200 cubic feet per bed these wards will accommodate 19 sick. There is no sleeping accommodation for orderlies, except in the wards.

The ground-floor ward is ventilated by four hollow beams carried across the ceiling, with inlets for air. The only change we would propose would be to provide a shaft, and to cover each of the inlets with a perforated zinc cornice. The large upstairs ward has six openings through the ceiling into the roof. Two of these we should propose to convert into shafts carried above the roof, and four inlets should be provided, two on each side the ward. The small ward should have a silk flap ventilator into the chimney, and one inlet for air. The fire-grates are very small, and might be remodelled with advantage to give additional warmth to the wards. All the ward windows should be hung to pull down at the top, which is not the case with most of them at present.

The hospital has no water-closet. There is a privy and cesspit in the yard, both of which are very offensive. The cesspit should be abolished, and the privy reconstructed as a water latrine. A suitable projection for a water-closet opening from the staircase could easily be built at the end of the hospital next the yard; and as there is neither bath-room nor lavatory, space could be obtained for these in the same projection. There is an ash-pit in the hospital yard, which should be abolished, as it is quite unnecessary; and the hospital refuse should be carried to the barrack ash-pit.

*The following are the Sanitary Improvements required for this Hospital:—*

1. Reduction of the number of beds to give 1,200 cubic feet per bed.

2. Ventilation to be improved by providing a shaft, and by covering the inlets in the lower ward with perforated zinc diffusing cornices. Two shafts and four inlets for air to be provided in the upper large ward. Small upstairs ward to have a silk flap ventilator into the chimney and one inlet for air. Ward windows to be made to open at top. Ward grates to be remodelled.

3. Water to be laid on. A water-closet, bath, and ablution-room, with hot and cold water laid on, to be provided. Cesspit in the yard to be abolished, and the privy drained and converted into a water latrine. Ash-pit to be removed.

## III.—NORTHAMPTON.

### Royal Artillery Barrack.

This barrack is situated on one side of a public street at the outskirts of the town of Northampton. The ground slopes from the street towards the barrack, and from the barrack down the parade ground in the direction of its length, to the lower boundary wall and towards the open country. The fall is amply sufficient for every purpose of drainage were it taken advantage of, which is not the case at present. The river Nen is about a quarter of a mile from the boundary, and there is an outlet at the lowest end of the parade ground. The total area within the boundary enclosure is 9A. 29P.

The subsoil is sandy with a slight admixture of loam. In dry weather the surface is dry and dusty, but in wet weather it is sloppy from want of drainage.

The barrack buildings are of stone, and were constructed at the end of last century.

They are arranged as follows:—First, the guard-room, canteen, cells, and one or two offices are placed close to the gate. Opposite these and at a short distance are three blocks built parallel to the boundary wall. The centre block contains officers' quarters, and each of the two sides blocks contains a range of stables on the ground floor, with a range of men's rooms over them, and above the men's rooms are attics intended for stores, but which are now partially occupied as soldiers' rooms. Behind these blocks, on each side the parade ground, are placed the forage sheds, privies, dung heaps, and ash-pits, and near the lower end of the slope on one side is placed the hospital, with the infirmary stables opposite to it.

The barrack-rooms in each block are reached by a stone staircase in the middle of its length, from the top of which a corridor opens right and left with a window at each end. In one of the blocks the end rooms have been appropriated for pensioners and stores, and the corridor blocked up, so that the light and ventilation, such as they were, of one half of the corridor have been cut off to obtain this accomodation; part of which, that containing stores, could have been quite as well obtained by appropriating an attic for the purpose. We are of opinion, that the pensioners and stores should be removed, and the ventilation of the corridor at that end completed by reopening the end window.

The soldiers' rooms open right and left out of the corridor.

Access is obtained to the attics by means of a narrow stair opening out of the corridor.

There are altogether five serjeants' rooms, 14 soldiers' rooms, and two attics extending the whole length of the blocks, and the total regulation accommodation is for 218 non-commissioned officers and men; but at the time the return was made to us the actual occupants of the barrack-rooms exceeded the regulation accommodation by no less than 25 per cent. If such deviations in allotting the space in barracks are to be continued, it need be no matter of surprise if a continued high sick rate is the result. The details of the regulation accommodation, contrasted with what it would be at 600 cubic feet per man, are given in the following table:—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| A. Wing. | | | |
| 1 - - | 9 | 7 | 2 |
| 2 - | 9 | 7 | 2 |
| 3 - - | 9 | 7 | 2 |
| 4 - - | 9 | 7 | 2 |
| 5 - - | 4 | 4 | — |
| 6 - - | 9 | 7 | 2 |
| 8 - - | 9 | 7 | 2 |
| Attic - - | 46 | 26 | 20 |
| C. Wing. | | | |
| 1 - - | 9 | 7 | 2 |
| 6 - - | 9 | 7 | 2 |
| 7 - - | 4 | 4 | — |
| 8 - - | 9 | 7 | 2 |
| 9 - - | 9 | 7 | 2 |
| 10 - - | 9 | 7 | 2 |
| 11 - - | 9 | 7 | 2 |
| Attic - - | 46 | 26 | 20 |
| Total - | 208 | 144 | 64 |

The whole barracks, including the attics, have space for no more than 144 men at somewhat less than 600 cubic feet each, and the men should be allotted to the rooms in the proportions given in the above table. The attics are, however, bad barrack-rooms, and are more suited for stores. They should certainly not be occupied in their present state, except on emergency.

And if additional accommodation for troops is required on this station the attics should be raised and converted into proper barrack-rooms.

The rooms on the first floor are of the usual construction. They open right and left out of the corridor by doors close to the fireplace, and there is one low window near the fire and opposite the door, leaving the rest of the room in obscurity. An additional window ought to be opened in each room, and the door moved to the end furthest from the fire, which would materially improve the healthiness and comfort of the rooms.

In reports on other barracks we have recommended the lighting and ventilation of the corridor by shafts carried from its ceiling to the ridge. In the present instance the length of the corridor is not so great as to render these shafts requisite, provided additional light be admitted to it by glass panes placed in the upper part of the wooden partition separating the soldiers' rooms from the corridor. Advantage should also be taken of the staircase leading to the attics to make it fulfil the purposes of a shaft for ventilating the corridor, which could be easily done by carrying a large louvre from its ceiling to above the roof. Panes of perforated glass should at the same time be placed in the upper sashes of the windows at the end of the corridors.

The attics extend the whole length of each block, but they are only about half the breadth of the block, because a partition is carried from the floor on each side to the slope of the roof, about six feet within the eaves. They are divided by arches, in which are carried up the chimney flues of the rooms below, and they are partially lighted by a small window at each end, and by a few dormer windows in the roof. They have no fireplaces, and are warmed by iron stoves.

The ventilating arrangements of the men's rooms are of a somewhat singular character. There is an opening in the ceiling of each room, with a sliding cover giving egress to the foul air into the space cut off from the sides of the attics already mentioned, and there are gratings with covers in the partition dividing the space from the attic, by which the foul air from the rooms below can pass directly into the attics, while the attics themselves have no means of ventilation whatever. The practical effect of this singular arrangement is the following :—If the covers be left on the openings, either above or below, there must be stagnation of air ; in summer, if the covers were removed from the openings, the foul air of the lower rooms would pass directly into the attic rooms to be breathed by the men there, as there is no provision for its escape ; while in winter, if the attics were occupied by men, the fires in the rooms below would draw the foul air down through the openings, to be breathed by the men in the lower rooms. This arrangement, which in practice secures that in one way or other foul air shall be breathed by the men, must be done away with as follows :—From the central opening in the ceiling of each of the lower rooms a shaft of the usual area and construction must be carried directly through the roof of the block ; next, each of these rooms must have an inlet for air, covered by a cornice of perforated zinc through the outer wall close to the ceiling at the end furthest from the fire. The fire-grate in each of these rooms should be remodelled to warm part of the inflowing air during winter.

The attics should be ventilated by louvres with four divisions, on Muir's principle, one louvre being carried through the ridge between each pair of arches.

It will be necessary at the same time to ventilate the stables to prevent the effluvia passing into the barrack rooms, for which purpose a shaft should be carried from each of the four corners to above the roof, and the shaft should be lined inside with soldered zinc.

The barrack is lighted by candles, although gas can be readily obtained. One burner should be placed in each room under the central ventilating shaft, to secure that the effluvia are carried off.

A small room, called a school-room, is used as a tailor's shop. It requires a silk flap ventilator in the chimney, and an inlet for air. There is another school-room of the same construction as the barrack-rooms. This room requires a shaft and inlet for ventilation. All the non-commissioned officers' rooms should have silk flap ventilators into the chimneys.

There is no ablution-room, and no bath-room at present. We are informed that two are to be built. They should each have a space cut off for one bath, with water laid on.

There are no proper arrangements in these barracks for washing or getting up linen. There is a small building near the hospital intended for a wash-house, but it is not now used for such a purpose. It has boilers, but no other convenience. It might be made sufficient for the wants of the barrack by putting up fixed tubs and a drying stove, and laying on water.

Each soldiers' block has a cook-house at the foot of the stair. They are large light rooms, with six boilers in each. A brick oven has just been put up in one of the cook-houses, with capacity to cook for 100 men. It requires an hour to heat, two and a half hours to bake, and about 70lbs. of coal. It is stated to answer satisfactorily.

The cook-houses themselves being under the men's rooms should have better means of ventilation ; and if space can be found for a shaft nine inches square, without interfering materially with the rooms above, one such shaft should be carried from the ceiling to above the roof.

The method of water supply is bad. It is derived partly from the roofs, the water from which is caught in a tank capable of holding from 7,000 to 8,000 gallons. There are, besides, two deep wells sunk in a porous subsoil, partly of shale.

One of these wells is 130 feet deep, and about 40 feet from it there is a cesspit which receives the whole surface drainage of the stables. This cesspit has no overflow, and the foul water it receives has to find its way into the earth. Of course the readiest outlet for it is through the shale into the adjoining well, which there can be but little doubt receives part of its contents filtered, as the water raised from the well appears to contain a considerable quantity of organic matter.

This system of water supply is decidedly objectionable, and should be altered by introducing the town water.

In the proper sense of the term there is no drainage in these barracks. All the surface rain-fall, and the water from stables, cook-houses, &c. is conducted into two large cesspits near the wells, the position of one of which we have just described.

The privies are of course not drained. They are placed on each side the parade ground over cesspits periodically emptied, and close to the dung heaps.

They are in a noxious and offensive state, and require entire reconstruction as water latrines, with suitable divisions and half-doors, and the buildings require light and ventilation.

To enable this to be done, and the whole barrack to be properly drained it will be necessary to find an outlet for the drainage. It was stated to us that a new sewer was about to be constructed, which would pass the barrack enclosure ; and should this be done an outlet could be easily obtained. But if the work is not likely to be carried out shortly, we would recommend that another outlet be sought for beyond the lower end of the parade ground. The fall is so good that drainage works could be easily carried out.

The present urinals are of very defective construction, and require to be remodelled, and to have water laid on for cleansing. The guard-room urinal is too close to the cell window.

There is no outlet for the drainage of the infirmary stables, all of which sinks down through the paving. This should be remedied.

The surface drainage and paving outside the barracks is not good. It should be relaid with square sets when repairs are needed.

The manure heaps are placed one on each side the parade ground. They are excavated below the surface level, and are objectionable on that account. We would recommend that they be filled up to a few inches above the level of the ground, and that they be surface paved and drained. The ash-pits should be dealt with in the same manner.

The ventilation and warming of the guard-room and cells are defective. The guard-room requires a shaft and inlet and a remodelled grate, and the cells should each have a shaft about 6 inches square through the roof. They should also have an inlet for air through the lower part of the door, capable of being closed except when the stove is lighted, and fresh air should be admitted round the stove.

The canteen tap-room and non-commissioned officers' room require each a silk flap ventilator into the chimney, and perforated glass panes in the upper sashes of the windows.

Northampton barracks are deficient in day-rooms, library, married quarters (except in soldiers' rooms), cleaning-room, and workshops, except a forge and shoeing shed.

*The Sanitary Improvements required for the existing Buildings are the following :—*

1. Reduction of the number of men of the rooms to the extent stated.

2. Ventilation of each soldier's room by a shaft and inlet, and by a remodelled grate. An additional window to be opened in each room. Doors to be removed to the end of the room furthest from the fire.

3. Corridors to be lighted by glass panes in the upper part of the partitions of the soldiers' rooms.

Pensioners and stores to be removed from the men's blocks, and the corridor end window restored. Each end window and each stair window to have panes of perforated glass introduced. Staircases to be ventilated by louvres through the roof.

4. Attics to be ventilated by louvres in the ridge, and to have additional light by means of skylights.

5. A gas-burner to be introduced into each barrack-room.

6. Stables to be ventilated by shafts from each corner carried above the roof.

7. School-room to be ventilated by a shaft and inlet. Tailor's shop to be ventilated by a silk flap ventilator into the chimney. Guard-room to be ventilated by a shaft and inlet, and to have a remodelled grate, and the cells by shafts and inlets as described. Canteen tap-rooms to be ventilated by silk flap ventilators and perforated glass panes in the windows. Non-commissioned officers' rooms to be ventilated by silk flap ventilators. Cook-houses to be ventilated by shafts.

8. Two ablution-rooms, with a bath in each and water laid on, to be provided.

9. Wash-house to be improved as described.

10. Town water supply to be laid on to the barracks.

11. Whole barrack to be drained to an outlet. Privies to be reconstructed as water latrines, with drainage, divisions of seats, half-doors, light, and ventilation, and all cesspits to be filled up. Drainage of stables and of parade ground to be improved. Urinals to be reconstructed and supplied with water.

12. Dung-pits and ash-pits to be filled up to above the level of the ground, paved and drained.

*Northampton Barrack Hospital.*

This building is situated at the lower end of the barrack parade, and is not surrounded by any separate enclosure. The surface drainage of the adjoining ground is defective, and after heavy rains the water finds its way into the kitchen. This is one of the results of the present state of the parade ground drainage, and will disappear when the ground is properly under-drained.

The hospital is two stories high. It has a kitchen, surgery, serjeant's room, and two wards. The passage and staircase are large and roomy, and the floors are all waxed. One of the wards is on the ground floor, and has regulation space for seven beds. It is very much over-crowded and should hold three beds at the outside. The other ward is on the upper floor, and has six beds where no more than three ought to be. Even with this smaller number the ward would be offensive from the want of ventilation. The total regulation accommodation in the hospital is for 13 beds. The windows open by sliding, and there are swing panes above the sliding part. The wards are low and confined, and the means of renewing the air are inadequate. Each ward will require a shaft carried from the ceiling to above the roof, and two inlets for air, one on each side. The fire-grates ought to be remodelled to warm part of the admitted air in winter.

The ward space at 1,200 cubic feet per bed is sufficient for about six beds, and additional accommodation will have to be provided by extending the hospital to make it commensurate with the requirements of the strength in barracks.

There is no bath-room. The shower bath stands in the passage. There is no lavatory for the sick and no water-closet. There is a small yard at one end of the hospital, containing a privy for the use of the sick placed over a cesspit, the contents of which when removed have to be carried through the yard. The dead-house is close to the privy, and is at present used as a coal store.

Amongst other deficiencies, this hospital has neither provision store nor pack store. It has no water supply except from a pump. It is lighted with candles, though gas might be obtained.

*We would recommend as follows with regard to the existing Buildings : —*

1. That 1,200 cubic feet be allowed to each patient, and that the hospital be extended to afford this amount.

2. The wards to be ventilated by shafts and inlets, and to have remodelled grates.

3. That the passage and staircase be ventilated by a louvre in the roof.

4. That an addition be made to the building accessible from the staircase, to contain a water-closet, a bath with hot and cold water, and an ablution table. That the privy in the yard be converted into a water latrine, drained, and the cesspit filled up.

5. That a better water supply be provided for the hospital, along with that for the barracks.

6. That gas be introduced, and a ventilated gas-burner put up in each ward.

## IV.—WEEDON.

Weedon barracks consist of two separate divisions at a short distance from each other. One division occupies elevated ground, and the other is situated on the banks of the canal close to the village.

This latter portion is now used for stores, military prison, chapel, &c., and the only part of the establishment at present occupied by troops is the barrack on the higher ground, to which this report has special reference.

The local position of this barrack is elevated, isolated, and healthy. It is built within an area of 4a. 31p. in extent, on a sandy and gravelly subsoil, with an excellent fall for drainage. The ground is a parallelogram, bounded on one side by the public road, but on the other sides surrounded by Government property. The officers' quarters are in a block close to the entrance. On the right and left of them are situated the guard-room, gun sheds, &c. At right angles to them, and at each end of the parade ground, are two ranges of stables, with men's rooms over them, called the East and West lofts, and opposite the officers' quarters are two blocks of barracks, known as the East and West barracks. Behind these, and at a lower elevation, are situated the cook-houses, wash-houses, &c., and below these again and further down the slope is the garrison hospital.

The buildings are all of brick, on stone basements, and were erected in the year 1806.

The barrack-rooms differ considerably in structure from each other; those over the stables are reached by three wooden staircases to each block. At the top of each end staircase are four rooms, and each centre staircase gives access to two rooms. The room space is carried up to the rafters, and the rooms are back to back with windows only on one side, except in the end rooms, which have windows on two adjoining sides. In some of the rooms there are windows opening into the staircase, which are of little use either for light or ventilation.

There are altogether 20 rooms, 10 in each block. 12 of these rooms have two doors each, and some of them have two fire-places. The rooms are dark and should have additional light, which could be most easily obtained by skylights in the roof.

There appear to be more staircases than are necessary for access to the rooms, or for the number of men, and possibly the central staircase of each block might be advantageously removed, and the space thrown into the barrack-rooms.

The East and West barracks are of better construction. They are two stories high, and have a wide central staircase, giving access to the rooms on the upper flat. The block called the East barrack contains three barrack rooms and two serjeants' rooms on each flat. The West barrack contains seven soldiers' rooms and two non-commissioned

officers' rooms. The following table gives the details of the accommodation :—

| Rooms. | Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| East Barracks. | | | |
| 1 - - | 14 | 9 | 5 |
| 2 - - | 16 | 12 | 4 |
| 3 - - | 16 | 12 | 4 |
| 6 - - | 14 | 9 | 5 |
| 7 - - | 16 | 11 | 5 |
| 8 - - | 16 | 11 | 5 |
| West Barracks. | | | |
| 3 - - | 16 | 12 | 4 |
| 4 - - | 16 | 12 | 4 |
| 5 - - | 13 | 9 | 4 |
| 6 - - | 14 | 9 | 5 |
| 7 - - | 16 | 11 | 5 |
| 8 - - | 16 | 11 | 5 |
| 9 - - | 13 | 9 | 4 |
| West Lofts. | | | |
| 1 - - | 12 | 10 | 2 |
| 2 - - | 12 | 10 | 2 |
| 3 - - | 14 | 13 | 1 |
| 4 - - | 11 | 10 | 1 |
| 5 - - | 20 | 16 | 4 |
| 6 - - | 11 | 10 | 1 |
| 7 - - | 12 | 10 | 2 |
| 8 - - | 14 | 10 | 4 |
| 9 - - | 12 | 10 | 2 |
| 10 - - | 12 | 10 | 2 |
| East Lofts. | | | |
| 1 - - | 12 | 10 | 2 |
| 2 - - | 12 | 10 | 2 |
| 3 - - | 14 | 13 | 1 |
| 4 - - | 11 | 10 | 1 |
| 5 - - | 20 | 16 | 4 |
| 6 - - | 11 | 10 | 1 |
| 7 - - | 14 | 10 | 4 |
| 8 - - | 12 | 10 | 2 |
| 9 - - | 12 | 10 | 2 |
| 10 - - | 12 | 10 | 2 |
| Total - | 456 | 355 | 101 |

All the rooms, if occupied at 600 cubic feet per man, would accommodate 355 men, but from this number must be deducted the complement for rooms 1, 5, 8, and 10, in the East lofts, giving accommodation at 600 cubic feet for 46 men, which rooms are appropriated at present as escort room, tailors' shop, school and store room, and serjeants' mess. These misappropriations reduce the total accommodation to that for 309 men, giving a deficiency of accommodation at 600 cubic feet for 147 men.

None of the barrack-rooms are ventilated. Those over the stables communicate with each other by gratings in the division walls. The rooms in the East and West barracks have a few wire-gauze panes in the windows, which are of little or no use. The readiest way of ventilating the rooms over the stables would be to place a louvre, constructed on Muir's principle, as nearly as may be in the centre of the ridge, and continued down within the room with reversed louvres, to prevent down drafts, as described in the paper of instructions. Two inlets should at the same time be provided in the outer walls of each room. The stables require ventilation in the usual manner, by shafts carried up from each corner to above the roof. They should also have more window space, as the present amount is by no means sufficient.

The rooms in the East and West barracks require ventilation by shafts and inlets of the usual construction ; and each non-commissioned officer's room throughout the barracks should have a silk flap ventilator introduced into the chimney.

All the barrack-rooms are warmed by the old pattern grates. As a necessary supplement to the ventilation, these should be removed, and remodelled grates for warming part of the admitted air substituted.

The barrack-rooms are lighted with gas. The burners should be ventilated in the usual manner.

The ablution accommodation in these barracks is very defective, both as regards the size and position of the ablution-rooms and the supply of water. The rooms are very small, and contain accommodation for no more than 32 men at a time out of a garrison of 465. They are situated a long way from some of the barrack-rooms, and the men have to undergo unnecessary exposure in resorting to them, while the water supply is so defective, that, as we have been informed, a number of men have often to wash successively in the same water, so that due cleanliness is practically unattainable. The ablution accommodation should never be less than for 10 per cent. of the force ; and in all future barracks the ablution-rooms should, if possible, be so distributed that the men can reach them, whenever practicable, under cover.

There are no baths. One is required for every 100 men, with water laid on. The accommodation should be given, if practicable, close to the ablution-room.

There is a women's wash-house, with four coppers, but no other facilities for washing. It is dark and unventilated. It requires fixed tubs, with water laid on, gratings for the feet, a proper drying and laundry stove, and light and ventilation through the roof.

There are three cook-houses fitted up with boilers. Two of these are large and lofty ; and in one of them a good brick oven for baking and roasting meat has just been constructed. The third cook-house is narrow and confined. All of them require additional light, which could be readily given by skylights in the roof.

The water supply is derived from five pumps, situated in the yards behind the barracks. The pump in the west stable-yard has been dry for about two years, so that the men in quarters there have been put to great inconvenience, and water has to be carted for the horses.

The supply from the other wells is said to be enough for ordinary purposes, though it appears to us to be very doubtful whether it will be by any means enough for the improved drainage we are about to suggest, and we are of opinion that a proper raised tank should be erected on the highest ground, which tank should be filled from a well in the valley by means of a small steam-engine, and the water from this tank should be laid over the whole barracks and hospital.

The barracks are surface-drained down the slope, and the main drain is carried under the canal. None of the drains are trapped, and none of the privies are properly connected with them.

There are altogether six privies within the barracks, and they are in an offensive condition. Several of them taint the air to a considerable distance. They are of the usual barrack construction, and are placed over cesspits.

They should all be reconstructed as water latrines, and should have divisions of seats, half-doors, light, and ventilation, and they should be all drained to an outlet. Probably the present outlet could be used, but if there be any objections to this course, we would recommend that the whole sewage of the barracks be led in earthenware pipes into a tank of sufficient distance (say 500 yards) from inhabited buildings, and applied to irrigate grass land after being filtered.

No water is laid on to the urinals, and they are otherwise defectively constructed.

The ash-pits are near the cook-houses, but the ashes appear to be carried to the manure heap, which is outside the barrack boundary.

Attached to the guard-room at the entrance gate are a lock-up and cells. The guard-room itself is not ventilated, and requires a shaft and inlet, as well as a remodelled grate.

The cells are unventilated and not fit for prisoners. The lock-up is a large, dark, unventilated room. It is to be improved, and should have a shaft through the roof for ventilation.

The provost establishment is in the lower barracks, and is in good condition. Weedon barracks are deficient in the following accommodation :—

Day-rooms, school-room, library (there is one half a mile off), and store-rooms. There is no accommodation for married soldiers, a want which is much felt in these barracks. There is no drill shed, cleaning-room, nor workshops ; and proper sleeping and mess accommodation are required for non-commissioned officers.

*The following are the Sanitary Improvements necessary for the present Buildings :—*

1. Reduction of numbers in all the barrack-rooms to the extent stated.

2. Ventilation of all the rooms over the stables by louvres in the ridge and inlets for air constructed as described. Ventilation of the men's rooms in the East and West barracks by shafts and inlets. Ventilating funnels and tubes to be supplied to the gas-burners. All staircase windows to have perforated glass panes in the upper sashes. Stables to have increased window space, and to be ventilated by shafts carried up from each of the corners to above the roof. Guard-room and lock-up to have a ventilating shaft through the roof and an inlet for air. All the barrack-room and guard-room grates to be reconstructed to warm part of the admitted air. Canteen tap-room and non-commissioned officers' rooms to have silk flap ventilators in the chimneys, and perforated panes in the windows.

3. Ablution accommodation to be extended and improved. Water to be laid on constantly to the tables. Gratings and pegs to be provided, and ventilation to be introduced through the roof. Baths with water laid on to be provided in the proportion of one bath to every 100 men.

4. Women's wash-house to be provided with fixed tubs and water laid on, and to have gratings and a drying and laundry stove. Light and ventilation to be afforded through the roof.

5. Cook-houses to have additional light by sky-lights.

6. Water supply to be increased and distributed over the barracks as described.

7. Privies to be reconstucted as water latrines ; to have light, ventilation, divisions of seats, and half-doors ; to be drained to an outlet, and the sewage disposed of in one of the modes suggested. All drains and gully grates to be trapped. Urinals to be reconstructed and supplied with water.

Lastly, the deficiencies in accommodation mentioned above, but especially that of married quarters, should be supplied as soon as practicable.

*Weedon Garrison Hospital.*

This hospital is situated on the slope below the upper barracks, in an airy exposed situation. It consists of a centre and two wings, the former being two stories high, the latter one story. One of the wings contains the kitchen, pack-store, coal-store, and wash-house. The other contains a ward, two water-closets, and a large bath-room. On the ground floor of the central block there is a nurse's room, steward's room, and two wards. Upstairs there are three wards and the surgery. The total regulation accommodation is for 40 sick, distributed as follows :—

| Wards. | Present Regulation Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency of Bed Spaces. |
|---|---|---|---|
| No. 1 - - | 7 | 4 | 3 |
| „ 2 - - | 7 | 4 | 3 |
| „ 3 - - | 7 | 4 | 3 |
| „ 4 - - | 7 | 4 | 3 |
| „ 5 - - | 7 | 4 | 3 |
| „ 6 - - | 5 | 2 | 3 |
| Total - | 40 | 22 | 18 |

The present wards contain space for only 22 beds instead of 40, showing a deficiency of 18 bed spaces.

The atmosphere of the whole hospital at the time we inspected it was in a most offensive condition, partly from the want of any sufficient means of ventilation, and partly from the defective condition of the water-closets. Each ward has a glass louvre in the window, and a few holes over the ward door. The louvre is covered by a wooden shutter, which is in some wards overlaid by the window blinds, so that the louvre cannot be opened unless the window is pulled down. This method of ventilation is insufficient, and each ward will require a shaft and inlets of the usual construction. Two inlets will be required for each ward, except No. 6, for which one inlet will be sufficient.

The wards are heated by the old pattern grate, which should be remodelled to heat part of the admitted air. It will be necessary also to ventilate the staircase by a shaft nine inches square, carried from the ceiling through the roof, and by perforated panes of glass in the windows.

On the upper floor there is a lobby, which is quite useless, and the whole space of which might be gained for ward space, or for some other useful purpose, by altering the position of the ward door.

The ward windows are on one side only, and each ward has one window, except ward No. 3, which has four windows.

The lighting at night is effected by a gas-burner in each ward, but none of the burners are ventilated. To remedy this defect, a proper funnel and tube connected with the chimney should be placed over each burner.

In the floor of the bath-room already mentioned, is a large sunken bath, like a tank, requiring, probably, from 700 to 800 gallons of water to fill it. It is not only utterly useless for its object, but tends to deteriorate the sanitary condition of the building, from always containing a certain quantity of stagnant water, and from the risk of part of this water draining into the subsoil under the wards. Indeed, so powerful an odour pervaded the adjoining ward, that part of the flooring was taken up to ascertain whether there was a drain passing underneath. This bath-room should be entirely remodelled, the present bath filled up, and a proper bath, with hot and cold water laid on, should be provided. A hospital ablution table, with tank, basins, and water laid on, should be constructed.

There is space enough for this, and proper ablution accommodation is essentially necessary, as the only place for the patients to wash in is the cold damp hospital wash-house in the opposite wing. When the bath-room is re-arranged it should be ventilated by a louvre in the roof.

There are no sufficient means for washing and drying the hospital linen. The wash-house is inadequately supplied with the means of doing so. It requires fixed tubs, with water laid on, gratings, and ventilation, and proper means of drying; but it would be more conducive to the health of the hospital to wash the hospital linen elsewhere.

There are two water-closets on the ground floor of one wing, in so defective a condition that the smell from them can be distinctly traced into the adjoining ward.

This defect appears to arise partly from want of water, and partly from their construction. The only remedy is to reconstruct them, to see that they are properly drained, and to provide a constant water supply.

There is a privy in the yard drained into a cesspit close to the hospital. It requires to be converted into a water latrine and drained, and the cesspit abolished.

The whole drainage and water supply of this hospital should be improved along with that of the barrack, for in all essential points both are equally defective.

There is an ash-pit in the yard in a position where it is likely to influence injuriously the purity of the air. It should be removed and provision made for collecting and taking away the hospital refuse daily.

Besides additional ward space, Weedon hospital requires a provision store; the only substitute for which at present is a small cupboard in the kitchen, another small cupboard in the surgery being used for keeping medical comforts. The pack store requires racks, and more shelves are required for the store-room. There is no accommodation for the sick of soldiers' families; indeed the hospital accommodation, even in the present over-crowded state of the wards, is so deficient, that occasionally temporary hospital accommodation has to be provided in the adjoining infantry barracks, an expedient to be deprecated for obvious reasons.

Nothing short of extending this hospital on an improved plan will supply the required ward space for the strength in barracks. So far as the existing buildings are concerned, *we would sum up our recommendations as follow*:—

1. Reduction of the number of beds in each ward to the extent specified.

2. The ventilation of each ward by shafts and inlets as described. Ventilation of the staircase by a shaft and perforated glass panes. Ventilation of the bath-room and wash-house through the roof.

3. Reconstruction of the ward grates so as to warm part of the admitted air.

4. A ventilated gas-burner to be introduced into each ward.

5. Bath-room to be re-arranged, the existing bath filled up, a proper bath, with hot and cold water laid on, to be provided, and a proper hospital ablution table.

6. Wash-house to be provided with fixed tubs and water laid on, gratings for the feet, and a laundry stove.

7. Present water-closets to be reconstructed with improved soil-pans and a constant water supply. Privy in the yard to be reconstructed as a water latrine with drainage, and the cesspit to be filled up.

8. The hospital drainage and water supply to be improved along with those of the barrack, and all drains to be trapped. Hospital ash-pit to be abolished, and the refuse collected and removed daily.

DOUGLAS GALTON.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission, June* 3, 1859.

---

# LIVERPOOL DISTRICT.

SIR,

IN conformity with our instructions we have visited the North Fort and Rupert House barracks, Liverpool, the barracks in Chester Castle, and the New Cavalry and Infantry barracks at Owlerton, near Sheffield, and we have the honour to transmit the following Reports regarding them.

## I. LIVERPOOL.

### 1. NORTH FORT BARRACKS.

These barracks are situated at the north-western extremity of Liverpool docks, behind a battery erected for the protection of the river. They close in the rear of the battery, and are constructed so as to protect it against surprise.

There is one range of soldiers' barracks pierced in the centre by the gateway. At one extremity of this range is placed the officers' quarters, built at right angles, and at the other extremity is the hospital.

The barrack-rooms are on two floors. A central passage and stone staircase give access to two rooms on each floor running from front to back of the buildings. The roof is of brick arches supported by iron girders and covered with asphalte. On the upper floor there is a serjeant's room taken off the passage between the two men's rooms.

The barrack-rooms have wooden porches inside to cover the doors, which are in the centre of the length of the room opposite the fire-place, which latter is of the old construction, and wastes much heat. At one end of the room are two windows, and at the other are loopholes and a small window protected by iron shutters.

Each room is intended to accommodate 25 men at an average cubic space of about 460 feet per man. The following table shows the present regulation accommodation in the men's rooms contrasted with what it would be at 600 cubic feet per man:—

| Rooms. | Total present Regulation Number of Men. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 8 | 200 | 160 | 40 |

By reducing the number of men per room, from 25 to 19, a trifle more than 600 cubic feet per man would be given, but considering the isolated exposed position of the fort, 20 men per room may be fixed as the regulation number.

There are no special means of ventilation for any part of the building. In consequence of the brick-arched roof there would probably be considerable difficulty in making the usual ventilating shafts; we would therefore propose to make the best use we can of any opportunities for ventilation which the buildings may afford. We would propose, first, to ventilate each staircase by a ventilating lantern to be placed over an opening in the roof of the staircase already existing, and to place panes of perforated glass in the stair window; we would further propose to place one of the largest sized silk flap ventilators in each chimney. We would propose to provide the necessary inlets for fresh air, one at each end of the room, close to the ceiling.

In order to make the chimney act as an outlet it would be necessary that each fire-grate be altered so as to contract the throat of the chimney below, and at the same time to provide for warming part of the air admitted. The opening for admitting air so warmed should be placed rather nearer to the ceiling, and as far from the silk flap ventilator as possible. There is gas in the barrack-rooms, but the burners are not ventilated. A funnel and tube of large dimensions.

should be carried from the gas burner into the chimney of each room, so as to obtain the twofold advantage of removing the gas vapour and increasing the amount of outlet for impure air from the rooms.

In order to obtain the benefit of this not very satisfactory method of ventilation, it is necessary that all the parts of it, including the remodelled grates, should be carried out. The serjeants' rooms should also have a silk flap ventilator into the chimney.

The guard-room requires ventilation by a silk-flap ventilator, an inlet for air, and a remodelled grate, combined in the same manner as in the barrack-rooms. The cells appear to have sufficient ventilation.

The library and school-room are over the entrance archway, and are formed out of one barrack-room, with a partition thrown across ; one part is warmed by a fire-place, the other by a stove. Both rooms should have inlets for air, and the school-room should have a large silk flap ventilator in the chimney.

The staff serjeants' quarters should have a ventilating funnel and tube from over the gas carried into the chimney.

There is a serjeants' mess-room over the guard-room, and a mess kitchen; the mess-room requires a silk flap ventilator, and an inlet for air like those of the barrack-rooms.

There is one cook-house ; it is a long narrow apartment, with boilers of the ordinary elliptical pattern ; there are no other means of cooking. A roasting oven is required.

The women's wash-house has fixed tubs, but requires a grating to stand on. It is under the barrack store. It should have an opening near the ceiling to carry off the steam. A drying and laundry stove is also required.

The men's ablution-room is too small ; it has a slate ablution table with a bead and pegs, but there is no bath. Space for one bath might be found in some other part of the fort.

The privies are dark and offensive, with the usual ladder construction of seat. The soil falls into a sewer into which the tide has access, and removes periodically a certain proportion.

These privies should be altered into water latrines, with a shallow receptacle on Macfarlane's principle, in which water should always stand. Adequate light and ventilation with proper divisions of seats should also be provided.

There is an ash-pit close to the privies at the end of a narrow passage. It should be abolished, and an iron cart substituted, which should be made available for collecting and removing both barrack and hospital refuse.

The water supply is ample, being derived from the town supply.

The ditch in front of the gate of the fort has no drainage, and is stated to be very offensive occasionally. It should be properly drained.

*The following are the Sanitary Improvements we would recommend for these Barracks :—*

1. Reduction of the numbers of men from 25 to 20 per room.

2. Ventilation of each barrack-room by an Arnott's silk flap ventilator in the chimney, by two inlets for air, and a remodelled grate. Ventilation of the staircases by a ventilating lantern and perforated panes. Gas-burners to be ventilated. Guard-room to be ventilated in the same manner as the barrack-rooms. Library, school-room, and serjeants' mess to be ventilated as described. Serjeants' rooms to have ventilators for the gas burners, and Arnott's ventilators.

3. A roasting oven to be introduced into the kitchen.

4. Women's wash-house to have gratings and ventilation, and a laundry and drying stove.

5. One bath, with water laid on, to be provided.

6. Privies to be reconstructed as water latrines, with divisions of seats, half-doors, light, and ventilation ; ash-pit to be abolished.

7. Ditch to be drained.

*North Fort Hospital.*

The construction of this hospital differs in some respects from that of any other similar building we have seen, and its form and arrangement appear to have been considered more with reference to the shape of the fort than to the recovery of the sick. It is an irregularly built, gloomy, and unventilated structure, standing in a narrow confined yard, at the north-west end of the soldier's barracks. On the ground floor are the kitchen and serjeants' room, both placed on one side of a central passage and staircase ; on the other side are the surgery, a water-closet, and the itch ward, into which access can only be obtained from another entrance, and at the end of the passage is a second water-closet. Both closets are dark, and there is no ventilation for either, except into the passage, and no ventilation for the passage and staircase except into the wards or into the outer air by a door, and by a window over it.

There are three wards, a pack store, and a bedding store, and a water-closet up stairs, but the upper passage is equally devoid of through ventilation as is the lower. The pack and bedding stores are both damp, and require means of keeping their contents dry ; an allowance of coal would answer the purpose.

The accommodation in these wards is as follows :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 9 | 4 | 5 |
| 2 | 9 | 4 | 5 |
| 3 | 6 | 3 | 3 |
| Total - | 25 | 11 | 13 |

These wards ought on no account to have more than 11 beds allotted to them, and as there are no means of extending the accommodation, it would be advisable to provide additional ward space adjoining the recruiting barrack at Everton, or in some equally eligible situation.

Notwithstanding the serious structural defects, and the overcrowding in this hospital, none of the wards are ventilated, and as the roof is arched of brick, it would be difficult, if not impossible, to provide suitable outlets for the foul air. The only practicable way of obtaining an outlet is the one we have recommended for the barracks, namely, introducing a large sized Arnott's silk flap ventilator into each ward chimney, and to place two of Sherringham's medium-size ventilators in each ward, close to the ceiling, to answer as inlets for fresh air. The fire-grate should also be altered to warm part of air admitted, care being taken to place the inlet for warmed air as far as possible from the Arnott's ventilator, and rather nearer to the ceiling. Another method of increasing the ventilation would be to place ventilating funnels and tubes over the gas burners in each ward, to convey the products of combustion into the chimney.

Under one of the wards is placed the kitchen. A shaft cannot be provided for ventilating it ; instead of which a perforated glass pane should be placed in the upper sash of each of the windows. It is absolutely necessary that ventilation should be supplied to the water-closets by means of a direct communication with the outer air, and, if possible, more light should also be introduced.

In order to afford some ventilation to the staircase and passages, we would recommend the introduction of perforated glass panes into the upper sashes of all the windows.

In a small yard close to the hospital door is placed the ash-pit. It is very narrow and very deep, and appears never to be thoroughly emptied. It should

be abolished, and provision made for removing the hospital refuse, with that of the barracks, daily.

There is no proper ablution-room; the wash-house is used as a bath-room, but it has only a moveable slipper bath. The wash-house might be converted into a proper bath and ablution room, having a covered means of access from the hospital, if another small wash-house could be obtained.

This hospital occupies so very confined a space, its plan is so defective, and the amount of accommodation it can afford, namely, that for 11 patients, so small, that we cannot advise much expense to be incurred in improving it, and any extension of it would be impracticable.

If the accommodation be limited to 11 beds instead of 25, the present number, the building might be rendered more suitable for sick than it is by the improvements we have pointed out, and the remaining sick should be provided for elsewhere.

*The Improvements are as follow:—*

1. Reduction of the number of inmates in each ward to the extent shown in the table.
2. Ventilating each ward for the reduced number of sick by a silk flap ventilator in the chimney, by two of Sherringham's ventilators, and by remodelling the fire-grates to warm part of the admitted air in winter.
3. Ventilating the gas-burners by funnels and tubes into the chimney.
4. Ventilating the water-closets to the external air, and if possible affording them some light.
5. Ventilating the staircase and passages by perforated glass panes in the top range of the upper window sashes; ventilating the kitchen by perforated glass panes.
6. Abolishing the ash-pit, and providing for the daily removal of the hospital refuse.
7. A bath-room with one fixed bath, hot and cold water laid on, and an ablution table to be provided.

### 2. Rupert House Recruiting Barrack, Everton.

This is an ordinary dwelling-house, situated on high ground on the north-east side of Liverpool, which has been taken on lease for 21 years, and is used as a depôt for recruits.

Thirteen of the rooms are appropriated as barrack-rooms, and the total regulation accommodation is for 148 men and four staff serjeants. Some of the rooms are overcrowded, as will be seen by the following table:—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Ground floor: | | | |
| 1 | 10 | 9 | 1 |
| 1 | 11 | 9 | 2 |
| 1 | 11 | 10 | 1 |
| 1 | 10 | 8 | 2 |
| 1 | 17 | 13 | 4 |
| First floor: | | | |
| 1 | 8 | 6 | 2 |
| 1 | 12 | 9 | 3 |
| 1 | 3 | 3 | — |
| 1 | 8 | 8 | — |
| 1 | 16 | 13 | 3 |
| 1 | 13 | 10 | 3 |
| Second floor: | | | |
| 1 | 11 | 9 | 2 |
| 1 | 12 | 12 | — |
| 1 | 6 | 4 | 2 |
| Total - | 148 | 123 | 25 |

By removing 25 men from the construction in the proportions given in this table, an average space of as nearly as possible 600 cubic feet per man will be given for the remaining 123 men. The occupation of the house as a recruiting barrack must necessarily be very irregular, and it would be advisable to distribute the recruits in the rooms, so as to give them plenty of cubic space.

The rooms are most of them very good and well suited for their purpose. They are light, spacious, and clean, but not sufficiently ventilated.

We would recommend that each room be provided with a large Arnott's silk flap ventilator into the chimney, and a perforated zinc pane in the upper sash of each window.

In two rooms there are ventilating openings into closed-up chimneys, but the ventilators are shut up. The present ventilators should be removed, and permanent openings substituted.

The large central staircase should be ventilated through the roof, and by a few perforated glass panes in the windows.

An ablution room has been made in a cellar in the basement of the house. A fixed bath has also been put up, but in a position to interfere with a portion of the ablution table, and with no partition round it. It should be removed near to one of the windows, and provided with a proper partition, bench, pegs, &c. The kitchen range is out of repair, and requires improvement.

The men's privy is a water latrine in which the water stands—it is too deep. The serjeants' privy empties into the ash-pit as its cesspit; the ash-pit should be abolished, and an iron cart substituted; the serjeants' privy should be converted into a water-closet. A urinal is required.

The water supply, derived from the town mains, is sufficient.

*The following are the Sanitary Improvements required for this Barrack:—*

1. Spreading the recruits through the rooms to give as near as may be 600 cubic feet of space.
2. Introducing a large silk flap ventilator into the chimney of each barrack-room, and to open permanently the ventilators into the closed-up chimneys in two of the rooms. Introducing a pane of perforated zinc into the upper row of each room window, and into the upper row of each passage and stair window.
3. Providing a ventilating funnel and tube to each gas burner.
4. Re-arrangement of the bath accommodation as recommended above.
5. Repairing the kitchen range.
6. Conversion of serjeants' privy into a water-closet. Providing a urinal. Abolition of ash-pit, and substitution of iron cart for it.

## II. CHESTER CASTLE.

### Infantry Barracks.

Chester Castle is situated at the southern extremity of the city of Chester, on elevated ground overlooking the river Dee. The situation generally is open, airy, and healthy, but the buildings of the city come close up to the walls on one side, and almost enclose the hospital.

The assize courts occupy the centre of the castle yard. On the south-west of them are barrack buildings known as the upper ward, and on the north-eastern side are the buildings of the lower ward.

The upper ward barracks were erected in 1835, and those of the lower ward in 1809.

The area within the barrack enclosure amounts to 4A. 2R. and about 30P. The subsoil is new red sandstone rock, and the means of natural drainage are amply sufficient.

The buildings of the upper ward consist of a single block of barrack-rooms facing towards the south-west and close to the parapet. Close to these, and

running at right angles are other buildings used as barrack offices, kitchen, privies, &c.; lower down, and running parallel to the barrack block, are the officers' quarters.

The buildings of the upper ward generally are simple and well arranged for securing external ventilation. Those of the lower ward are, however, more complicated, and by no means so well ventilated externally. Part of them face the court of the castle, and are parallel and opposite to the officers' quarters of the upper ward; part of them are built at right angles so as to form two sides of a narrow court behind, completed by high walls, and containing the kitchens, ablution houses, and the military prison, part of which is used as a school. Close to the latter building is the castle wall, outside which are the houses of the town and the hospital.

The present regulation accommodation in the soldiers' barracks is for 291 non-commissioned officers and men, distributed between the wards and rooms as follows :—

| Barrack Rooms. | Total present Regulation Accommodation in Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Upper Ward : | | | |
| 1 | 16 | 16 | — |
| 2 | 20 | 20 | — |
| 3 | 20 | 20 | — |
| 4 | 16 | 16 | — |
| 5 | 16 | 15 | 1 |
| 6 | 20 | 19 | 1 |
| 7 | 20 | 19 | 1 |
| 8 | 16 | 15 | 1 |
| Lower Ward : | | | |
| A. | 20 | 18 | 2 |
| B. | 29 | 26 | 3 |
| C. | 20 | 18 | 2 |
| D. | 35 | 31 | 4 |
| E. | 10 | 7 | 3 |
| F. | 13 | 11 | 2 |
| H. | 13 | 11 | 2 |
| Total - | 284 | 262 | 22 |

The barrack-rooms, as a whole, are very little overcrowded, and the overcrowding is chiefly confined to rooms in the lower ward, the external ventilation of which is the most defective.

The rooms in the *upper ward*, as already stated, are in a single block, consisting of a basement, in which is situated the armoury of Chester Castle, and two floors of barrack-rooms above. The rooms are entered by a central door, giving access right and left to a short glazed corridor, and to a stair in front, giving access to the men's rooms above through a similar glazed corridor.

On each floor there are four barrack-rooms. Two of these rooms on each floor are entered from the end of the corridor, and two from its side. The end rooms have windows at their opposite ends, so that by opening them a thorough ventilation can be obtained. The rooms entering from the side of the corridor have windows only on one side, and are not so well ventilated.

The end rooms on the lower floor have no means of ventilation, except the doors, windows, and fireplaces. The end rooms on the upper floor have openings in the ceilings. The other rooms, both above and below, have openings into the passages, but none to the external air.

The ventilation in all of the rooms is defective, and should be improved by carrying a shaft from the ceiling of each room to above the roof of the building. Each of the end rooms should have two inlets for air of the usual construction placed close to the ceiling. In the upper end rooms the outlet shaft might be carried up from one or more of the existing openings near the middle of the ceiling, the others being closed up.

All the other rooms, except the end rooms, will require one inlet to the outer air on one side, and the other inlets to the passage may be left as they are, provided the passages themselves be properly ventilated by inserting a pane of perforated glass, or of perforated zinc, into the top row of panes in the upper window sashes.

To complete the ventilation, it will be necessary to remodel the fire-grates to warm part of the admitted air in winter. Those at present in use are of the old construction, and waste much fuel which might be easily employed in adding to the warmth of the rooms, and facilitating the ventilation.

There is a small serjeants' room taken off the landing on each flat. These rooms should each have a silk flap ventilator put into the chimney.

The rooms in the *lower ward* barrack buildings are entered from spacious lobbies, passages, and staircases. A part of the passages is dark, and without sufficient ventilation. The rooms generally have some means of renewing the air. Those on the ground floor have hollow beams with openings on the lower sides. These beams would serve the purpose of inlets if the present openings were closed, and openings made in the sides, and covered with louvres, so placed as to turn the air up to the ceiling. Each of these lower rooms would require an outlet shaft or shafts of the proper sectional area to be carried from the corners of the ceiling to above the roof.

The rooms above have simply openings through the ceiling for ventilation. This plan is defective, and we would advise that one or more of the openings nearest the centre of the ceiling should be connected with an outlet shaft and carried above the roof. Two inlets for air, of the usual construction, placed close to the ceiling would be required in each of the upstairs larger rooms, but one inlet would be sufficient in the present 10 and 13 men rooms.

All the barrack-room grates in the lower ward require to be reconstructed to warm part of the admitted air.

Out of the dark passages of these buildings a number of small rooms open, which are used for a variety of purposes, such as serjeants' rooms, offices, &c. All of them are without ventilation, and all should be provided with silk flap ventilators into the chimneys. Underneath these rooms, in the basement of the lower ward barracks, are the workshops, shoemakers, tailors, &c. They are dark, damp, unwholesome, and quite unfit to be occupied by human beings. We would recommend their being immediately evacuated. In the same basement is a dark room intended for a serjeants' mess. It is at present used as their mess kitchen, and a barrack-room up-stairs is set apart for the mess. The room in the basement is unfit for a mess-room, and ought not to be re-occupied for such a purpose.

All the passage and staircase windows in this part of the barracks require a pane of perforated glass or of perforated zinc put into the upper line of panes in each window.

None of the barrack-rooms are lighted with gas, although gas is laid on within the boundary. Each barrack-room should have one or more burners according to its dimensions. All the burners in the lower floor rooms would require to be ventilated by funnels and tubes carried either into the chimney, or, what would be better, terminating within the air shaft. If the burners in the upper floor rooms were placed under the openings of the shaft, recommended to be carried up from the ceilings, no further ventilation for the burners would be required.

There is no day-room for the men in these barracks, and there are no cleaning-rooms nor drill sheds.

There is a library and school-room both in one. The room is lighted with gas, and it is partly ventilated by inlets at the ceiling. It requires a shaft for an outlet, and a remodelled grate similar to those in the barrack-rooms.

There is one damp dark store-room in the basement of the lower ward. A better store-room is required.

There are two men's lavatories, one for the upper ward barracks and one for those of the lower ward. The ablution tables require beads, and there are neither gratings nor pegs. Authority has, however, been given for supplying these deficiencies. The town water supply should be laid on to both lavatories. The one belonging to the upper ward is dark and unventilated. It requires skylights and louvres in the roof. The lower ward ablution-room requires a louvre in the roof.

There are no baths. Three with water laid on are required.

Behind the buildings of the lower ward is the women's wash-house for the whole barracks. It requires fixed tubs and a drying stove.

Close to the wash-house is a good cook-house with boilers, but it has no other means of cooking. There is a similar cook-house at the end of the barrack block of the upper ward. It requires skylights in the roof. Both cook-houses require ventilated roasting ovens.

Water is derived partly from the works of the water company, and partly from two pump wells. The supply appears to be sufficient for all sanitary purposes. Two fire-plugs, one for each ward, are stated to be required.

The latrines are defective in construction and accommodation. There are two of them, one for each ward, and there are in all 13 seats for 284 men. Both latrines are flushed, but as they have no receptacle in which water stands they are very offensive. They should be enlarged and reconstructed as water latrines on Macfarlane's principle, with divisions of seats, half-doors, light, and ventilation. The adjoining urinals also require reconstruction, with water laid on for cleansing.

The water-closet in the ordnance storekeeper's house has no water except rain water, which is not sufficient in amount to keep it clean. A constant supply could be easily obtained from a neighbouring cistern.

In front of the upper ward barrack-rooms is a cellar used as an ash-pit. It ought to be abolished and the refuse removed daily.

One of the drains from the upper ward opens through the wall of the castle and spreads its contents over the grass close to the ball court where the men exercise. This requires to be remedied by carrying a proper drain from the present outlet to the river Dee, which is close at hand.

The guard-room requires a shaft and inlet, and a remodelled grate to improve its warming and ventilation.

There is no canteen, and there are no quarters for married soldiers in barracks.

*The Sanitary Improvements required for Chester Castle Barracks are as follow :—*

1. Reduction of numbers of inmates in the barrack-rooms to the extent stated.

2. Improvement of the ventilation and warming of all the barrack-rooms by shafts, inlets, and remodelled grates, as described. Ventilating all the non-commissioned officers' rooms by silk flap ventilators into the chimneys. Ventilating and warming the guard-room by a shaft, inlet, and remodelled grate. Improving the ventilation of the school-room and library by a shaft and remodelled grate. Ventilating all the passages in the soldiers' barracks by perforated glass or zinc panes in the windows.

3. Workshops in the basement of the lower ward barracks to be abandoned.

4. Barrack-rooms to be lighted with gas-burners ventilated as described.

5. Town water supply to be laid on to the lavatories. Upper ward lavatory to be lighted and ventilated through the roof. Lower ward lavatory to be ventilated through the roof.

6. Three baths, with water laid on, to be provided for the barracks.

7. Cook-houses to be supplied with ovens. Upper ward cook-house to be lighted by skylights.

8. Women's wash-house to be fitted up with fixed tubs and a drying stove.

9. Latrines to be reconstructed with water receptacles on Macfarlane's principle. The accommodation to be extended ; divisions of seats, half-doors, light, and ventilation to be provided. Urinals to be reconstructed ; ordnance storekeeper's water-closet to be better supplied with water ; defective drainage from the upper ward to be improved as suggested ; ash-pit in front of the upper ward barracks to be abolished, and provision made for daily removal of the barrack refuse.

Lastly, the deficiencies in these barracks bearing on the health and comfort of the men are as follows : — Day-rooms, covered drill shed, cleaning-rooms, canteen, and married soldiers' quarters.

### *Chester Castle Hospital.*

This building consists of a two-story detached house situated outside the Castle walls, and facing a public street. It has a central passage and staircase giving access to the wards and offices. On the ground floor is the serjeants' room, surgery, a bedding store, and one ward ; up-stairs there are two wards running from front to back of the building, and having opposite windows at each end. A fourth small ward has been taken off the upper landing.

The total regulation accommodation is for 23 sick, but the wards are very much overcrowded, as will be seen from the following table :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 5 | 3 | 2 |
| 2 | 8 | 4 | 4 |
| 3 | 8 | 4 | 4 |
| 4 | 2 | 1 | 1 |
| Total - | 23 | 12 | 11 |

By giving little more than 1,000 cubic feet per bed this hospital can accommodate no more than 12 beds. If a little more than 1,200 cubic feet were exacted it would hold 10 beds only.

The first step to improve this hospital is to diminish this great overcrowding, which can only be done by obtaining more ward space. Unfortunately the enclosure within which the present buildings are situated is very limited in size, and the buildings can only be extended at the ends. To accommodate safely the present proportion of sick, the cubic contents of the hospital must be doubled at least, and in some way or other the additional space will have to be acquired, if the building is to be used for its present purpose.

None of the rooms are ventilated ; all of them, except ward No. 4, require shafts carried from the ceiling to above the roof of the buildings. No. 4 can be ventilated for one patient, which is all it ought to contain, by a silk flap ventilator into the chimney. Wards 2 and 3 require two inlets for fresh air, of the usual construction, one at each end close to the ceiling. Ward No. 1 requires one inlet. All the wards should have remodelled grates similar to those already recommended for the barrack-rooms.

The only means of lighting at night is by candles, although gas is at hand; a ventilated gas burner is required for each ward.

There are no means of ablution for either sick or convalescents, and the only bathing accommodation is a shower and slipper bath.

An ablution and bath room might easily be constructed by throwing out a projection behind the centre of the hospital over the covered communication leading to the kitchen.

As there are no water-closets for the sick the required accommodation might be provided in the same projection.

There are two very defective privies in the back yard which ought to be reconstructed as proper water latrines. The urinal is also defective, and requires reconstruction, with water laid on for cleansing.

The kitchen is in the back yard of the hospital. It would be much improved by having a proper hospital cooking range introduced.

A very offensive ash-pit adjoining ought to be removed.

Water is obtained from a tank, and the buildings are drained into the town sewers.

The great defect in this hospital is its small size in comparison with the force in barracks, and the existing evils will not be fully remedied until it is enlarged or a new hospital built.

*The Improvements required for the present Buildings are:—*

1. Reduction of the numbers of sick in each ward.
2. Ventilation of the wards as described.
3. A ventilated gas burner to be introduced into each ward.
4. A projecting building to be erected behind the hospital to contain an ablution and bath room, and a water-closet. Privies in the back yard to be reconstructed as water latrines. Urinals also to be reconstructed and supplied with water. Ash-pit in the hospital yard to be removed, and all the refuse taken away daily.
5. A new cooking range to be provided for the hospital kitchen.

---

## III. SHEFFIELD.

### Cavalry and Infantry Barracks.

Sheffield barracks are of very recent construction, and are in many points superior to most other barracks in England; they are situated on the slope of a hill at Owlerton, about a mile and a half from the town, in an open airy situation, and are built round two squares, of which the upper square is occupied by infantry, and the lower square by cavalry. Below the cavalry square is the provost establishment, and still further down the hill, outside the boundary wall, married soldiers' quarters are being erected upon much the same plan as the excellent married quarters at Preston. The riding school stands behind one side of the cavalry square. The hospital is placed at the upper end of the enclosure at right angles to and near the officers' quarters, which occupy the upper side of the infantry square, and front to the public road.

The means of natural drainage are ample. The buildings are of brick, faced outside with stone, and were finished a year or two ago.

The total regulation accommodation of both cavalry and infantry barracks is for 35 non-commissioned officers and 811 men.

The following table shows the present regulation accommodation compared with what it would be at 600 cubic feet per man:—

| Barrack Rooms. | Total present Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Numbers to be placed in each Room to give 600 Cubic Feet per Man. |
|---|---|---|---|---|
| Houses A. B. C. 6 Rooms, Nos. 1 and 2 in each house. | 90 | 78 | 12 | 13 |
| Nos. 3 and 4 in each house, 6 rooms. | 96 | 78 | 18 | 13 |
| F. No. 1. | 18 | 18 | — | 18 |
| G. No. 1. | 15 | 13 | 2 | 13 |
| „ 2. | 18 | 18 | — | 18 |
| H. No. 1. | 13 | 11 | 2 | 11 |
| „ 2. | 18 | 18 | — | 18 |
| „ 3. | 15 | 13 | 2 | 13 |
| J. Nos. 1 and 2. | 36 | 36 | — | 18 |
| L. M. N. O., 1 and 2 in each house, 8 rooms. | 120 | 104 | 16 | 13 |
| Nos. 3 and 4 in each, 8 rooms. | 128 | 104 | 24 | 13 |
| P. No. 1. | 18 | 18 | — | 18 |
| Q. No. 1. | 29 | 29 | — | 29 |
| R. No. 1. | 12 | 12 | — | 12 |
| S. Nos. 1 and 2. | 42 | 40 | 2 | 20 |
| T. No. 1. U, No. 1. | 42 | 38 | 4 | 19 |
| U. No. 2. | 12 | 12 | — | 12 |
| V. Nos. 1 and 2. | 42 | 26 | 16 | 13 |
| X. No. 1. | 29 | 29 | — | 29 |
| Y. No. 1. | 18 | 18 | — | 18 |
| Total | 811 | 713 | 98 | — |

The total present accommodation in this barrack is for 811 men, but at the time the return was made to us, the number of men in barracks exceeded the construction by 82, in order, as was stated to us, to obviate the necessity of billeting.

The amount of cubic space per man allowed by the construction differs considerably in different houses; the smallest amount is 369 cubic feet, and the largest is as high as 703 cubic feet. As there are other reasons besides the cubic space which determine the number of men put on the construction, especially in cavalry barracks, we have in all cases in the preceding table, in which the construction exceeds 600 cubic feet, assumed the numbers in the rooms as those best adapted for regimental purposes, while in every case where the amount falls short of 600 cubic feet we have indicated the number of men each room ought to contain.

The deficiency, therefore, of accommodation for 98 men refers solely to those rooms in which the construction gives less than 600 cubic feet per man. Were it possible to distribute the men equally the deficiency of accommodation would be that required for about 75 men.

We would recommend that the number of men per room be in future those we have given in the last column of the table.

The rooms on the two sides of the infantry square are in blocks divided into houses; each house contains two rooms on the ground floor, with a passage between, and two on the upper floor, with the staircase and a serjeants' room between.

Off the staircase, a few steps below the upper landing, there is a door opening into a broad outside gallery extending the length of the buildings, and which gives access from one house to another on the upper floor. Each lower room has a serjeant's berth partitioned off.

The third side on the infantry square, and the three sides of the cavalry square, have rooms over the stables. The passages leading to the rooms are between every two stables, and each passage gives access to two rooms on the upper floor and a serjeants' room.

The rooms are spacious and generally well lighted. They vary from 11 feet 4 inches to 12 feet in height; most of them have four windows, two on each side, with a distance between the opposite windows of from 31 to less than 34 feet, and some of the larger rooms have five, six, and ten windows per room.

The rooms have all had a certain amount of ventilation provided in the structure by means of a shaft carried up in the chimney breast of each barrack-room. This shaft is about 7 inches by 5½ inches in area; but the aperture into the rooms is too small, and being besides covered with a perforated plate, which closes a great part of the area, the outlet for foul air is not sufficient. The cover should be removed, and the opening enlarged to admit of a wide wire grating, which should give a clear area of ventilating outlet at least equal to double the area of the shaft. There are no inlets for pure air except from the passage by openings over the top of a wooden porch covering the doors. These inlets are not sufficient, and an additional inlet from the open air close to the ceiling, between the windows, should be constructed at each end of the room. A large Arnott's silk flap ventilator should also be placed in every barrack-room chimney to increase the area of outlet.

The grates are constructed on a different plan from any which we have seen; the sides and top are inclined so as to throw a large amount of radiant heat into the room, but much of the heat of the fire is lost up the chimney which might be rendered useful for supplying warm fresh air to the rooms in winter were the flues remodelled to enable this to be done.

The serjeants' rooms have no ventilation, they should be provided with Arnott's silk flap ventilators. All the rooms are lighted with gas, but none of the burners are ventilated, and the fittings are reported as being extremely defective.

It would increase the general ventilation of the rooms to carry a ventilating tube from above each gas burner, and to turn the end of it into the chimney.

The stables are too dark. They have ventilation by small shafts over each horse carried up in the wall; the gratings which cover the shafts should be removed, and additional inlets for air should be provided.

The block of buildings which forms the lower side of the infantry square has its upper floor on a level with the parade ground, from which it is separated by an open area, and in front of the building, under the parade ground, are a series of arches opening into the area, and intended for the reception of ashes and manure. The position of the manure and dust heaps under the windows of the rooms, and without circulation of air, is very objectionable, besides which, from their construction, they would be emptied with difficulty. We are of opinion that they ought to be done away with as places of deposit for refuse of any kind, and that provision should be made for removing the manure, daily, either altogether beyond the walls, or that a dung pit should be provided in some less objectionable site within the boundary.

The ablution-rooms require additional light by means of skylights in the roof, they have no bead to the table, and no pegs, benches, nor gratings. Gratings have been authorized, but the other defects should also be supplied. These ablution-rooms are sufficiently ventilated through the roof. There are no baths; eight are required for the strength in barracks.

The cook-houses also require additional light to be given through the roof. They have the ordinary boilers, and brick ovens.

The privies are of the ordinary ladder construction, without divisions, and have a deep trough flushed out. The quantity of water they require is enormous, and they are nevertheless offensive. Latrines on Macfarlane's principle, with water always standing in them, would be much better, and ought to be introduced, instead of the present defective arrangements.

Urinals are placed beside the privies; they are of porous stone of the ordinary form. They require water for cleansing; they are not of the most improved construction.

The ash-pits are far too deep, and should be abolished, and iron carts substituted.

There are four women's wash-houses, two for cavalry and two for infantry. They have fixed tubs, but without water laid on; there are no gratings, though some are authorized. These wash-houses are dark and unventilated, and require skylights and louvres, &c. in the roof. There are no drying stoves; one should be provided for each wash-house.

The rain water which falls on the roofs is retained in 19 tanks. There are also 18 wells, besides which the barracks receive water from the town water supply.

There is a serjeants' mess-room and kitchen for infantry and cavalry; both have ventilation.

There are two excellent drill sheds, each 84 feet long by 36 feet wide. They are situated on the east and west ends of the south range.

The following are the workshops belonging to the barrack:—Two armourers', one saddler's, two tailors', two farriers', and two shoemakers'. They all appear to be ventilated on the same principle as the barrack-rooms, and would be improved by enlarging the openings of the outlets as recommended for the barrack-rooms.

The provost establishment has the cells ventilated, but the ventilation is too much under the control of the prisoners. One of the slides by which the ventilation can be closed should be removed.

The riding school is too dark, it should have skylights in the roof; it has enough ventilation.

There are self-acting water-closets, of a bad construction, in the officers' quarters. They are liable to get out of order, and can only be repaired by the patentee after considerable delay. They are placed under the stairs, and practically ventilated into the passage, and the force of water does not keep them sweet. They should be reconstructed in a less objectionable position.

The canteen is good; the tap-room has shafts for ventilation and inlets over the doors; the passage windows should have perforated panes.

The chapel school is ventilated.

The guard-room has a shaft for ventilation, but requires an inlet for air.

Sheffield barracks as a whole are very good barracks, but in some sanitary details they require improvements such as we have pointed out, and which we here sum up:—

1. Reduction in the number of men in the barrack-rooms to the extent stated.

2. Improving the ventilation of all the barrack-rooms, workshops, library, &c., by enlarging the openings of the present outlet shafts, as recommended, by providing additional outlets by Arnott's silk flap ventilators in the chimneys, and additional inlets for air between the windows. Ventilating the serjeants' rooms by Arnott's silk flap ventilators. Improving the ventilation of the stables by additional inlets for fresh air. Covers of the cell ventilators to be removed. Inlets for air to be supplied to the guard rooms. Canteen passage windows to have perforated panes of glass.

3. All the gas burners to be provided with ventilating funnels and tubes into the chimneys.

4. Manure and dust pits in the arches under the upper parade ground to be removed, other ash-pits to be done away with, and iron carts for daily removal of the refuse to be introduced.

5. Ablution-rooms to have light through the roof, beads to the tables, gratings, and pegs.

6. Eight baths with water laid on to be provided.

7. Cook-houses to be lighted through the roofs.

8. Women's wash-houses to have light and ventilation provided through the roofs; water to be laid on to the tubs, gratings for the feet to be provided, and a drying stove put up in each wash-house.

9. Privies to be reconstructed as water latrines on Macfarlane's principle, with seats, divisions, half-

doors, light, and ventilation. Urinals to be supplied with water. Water-closets in officers' quarters to be removed from their present position, and reconstructed.

*Sheffield Barracks Hospital.*

The hospital is by no means of so good a construction as the barracks. Its plan and arrangements are very complicated, and tend to interfere with that thorough ventilation and lighting which are essential to the rapid recovery of the sick. The building is in two divisions, one for cavalry, the other for infantry. It contains some wards with windows at each end, the beds being arranged down the dead walls, so that the effluvia from the sick must pass over the intervening beds before they can escape by the windows. There are some wards having windows to the open air only on one side, with windows opening into a glazed passage on the other. Some portions of the interior are defectively lighted, and one orderlies' room has no direct communication with the external air, either for light or ventilation.

There are in all nine wards and 90 beds, arranged as follows :—

| Cavalry Hospital Wards. | Total present Regulation Number of Beds. | Total Number at 1,200 Cubic Feet per Bed. | Deficiency of Bed Space. |
|---|---|---|---|
| No. 1. | 11 | 8 | 3 |
| „ 2. | 11 | 8 | 3 |
| „ 3. | 10 | 8 | 2 |
| Infantry Hospital Wards. | | | |
| No. 1. | 11 | 8 | 3 |
| „ 2. | 9 | 6 | 3 |
| „ 3. | 11 | 8 | 3 |
| „ 4. | 9 | 6 | 3 |
| „ 5. | 9 | 6 | 3 |
| „ 6. | 9 | 6 | 3 |
| Total | 90 | 64 | 26 |

The present regulation bed space in these wards varies from 816 to 872 cubic feet, and to give an average of rather less than 1,200 cubic feet per bed, it will be necessary to remove three beds out of each ward throughout the building, except No. 3 ward of the cavalry hospital, in which the excess of beds is two. The arrangement of the beds unfortunately cannot be altered, and it will still be necessary to place the sick with their heads against the dead walls of the ward, and with such an arrangement we are of opinion that the wards should never contain a larger number of sick than those given in the column showing the accommodation at 1,200 cubic feet per bed.

The wards have Arnott's ventilators and shafts carried up in the chimney breasts, similar to those in the barrack-rooms, intended to act as outlets for foul air. The gratings should be removed from the openings of the shafts and the openings enlarged to double the area of the shaft, as recommended for the barrack-rooms. There are inlets for air over the doors, but as there is little fresh air within the building these inlets can be of very limited use in ventilating the wards. Two inlets, with perforated zinc cornices, should be provided from the outer air close to the ceiling of each ward.

The passages should also be ventilated by a shaft carried up from the ceiling through the roof, and perforated panes of glass in the windows.

Each ward is lighted by gas-burners, but none of them are ventilated. They require ventilating funnels and tubes carried into the chimneys. There are two ablution-rooms, one for each hospital. One of the ablution-rooms has a fixed bath, but it is not partitioned off from the room ; this should be done.

There are self-acting water-closets in projecting blocks behind the staircases. These are complained of as being complicated and apt to get out of order, to the detriment of the hospital service ; they should be reconstructed on a better plan.

There are privies in the yard behind the hospital ; they are flushed, but are nevertheless very offensive ; they ought to be reconstructed as water latrines on Macfarlane's principle.

An ash-pit behind the hospital should be abolished, and means provided for removing the refuse daily.

The pack store is in the basement, and is stated to be sufficient and dry.

The kitchen is also in the basement; it is too dark, on account of the depth of the front area.

There are itch wards in the yard, with a privy attached. This privy should be reconstructed as a water latrine.

The wash-house is little used, as the hospital washing is done by contract, and such being the case, we do not consider it necessary to make any recommendations regarding it.

There is no accommodation for the sick of soldiers' families ; perhaps the simplest way of remedying this defect would be to provide a suitable room at the new married quarters.

*The following are the Sanitary Improvements required for Sheffield Barrack Hospital :—*

1. Reduction in the number of beds in each ward to the extent stated above.
2. Improving the ventilation of each ward by enlarging the opening of the outlet shaft, and by providing inlets for fresh air. Ventilating the passages by shafts and perforated glass panes. Ventilating the gas-burners into the chimneys.
3. Bath to be partitioned off from the ablution-room.
4. Water-closets to be reconstructed on a better principle. Privies in the hospital yard to be reconstructed as water latrines. Ash-pit to be removed, and provision made for the daily collection and removal of the hospital refuse.
5. Wash-house to be improved as suggested.
6. A proper orderlies' room, with windows to the external air, to be provided for the infantry hospital.

JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

To the Secretary of State for War.
*Barrack and Hospital Improvement Commission, July* 11, 1859.

## MANCHESTER DISTRICT.

SIR,

WE have the honour to transmit to you the following Report on the barracks of the Manchester district, with special reference to the matters contained in our instructions.

We have inspected the following barracks in Lancashire :—

1. Hulme, cavalry and artillery.
2. Salford, infantry.
3. Burnley, cavalry and infantry.
4. Bury, cavalry and infantry.
5. Stockport, infantry.
6. Ashton, cavalry and infantry.
7. Fulwood barracks, Preston, artillery, cavalry, and infantry.

Each of these barracks we proceed to report on separately.

### 1. HULME CAVALRY BARRACKS.

These barracks have regulation accommodation for 423 men, including non-commissioned officers.

They are situated at the outskirts of Hulme ; but

on three sides of the parallelogram occupied by the barracks, there is a densely built neighbourhood of houses and factories, coming close up to the boundary walls; and on one side only is the barrack yard open to the fields.

The stables have the barrack-rooms built over them, and extend along about half of each of the longer sides of the parallelogram, within a few yards of the boundary wall. Immediately outside the boundary wall on one side, and overlooking the barracks, is a large lofty mill, which interferes with the free circulation of air on that side; and over the boundary wall, behind the opposite range of barrack-rooms, are narrow streets of small cottage houses with double ranges of ash-pits, privies, and cesspools between them, and over these nuisances the air which supplies the barrack-rooms on that side has to pass.

A third side of the parallelogram is occupied by the canteen, riding-house, &c. Within the parallelogram, at the same end, is a line of buildings, in which are placed the officers' quarters, workshops, schools, library, &c.

The hospital is situated close to these buildings. Behind each range of barracks is a narrow, ill-paved, and defectively drained passage, across which, and immediately under the barrack windows, are the litter sheds. An open ash-pit and serjeants' privy are situated in the same line as the litter sheds. The space left between the boundary wall and the barracks is much too small, either for health or convenience.

These arrangements are by no means conducive to the healthiness of the barracks; but they cannot now be altered without obtaining possession of ground outside the boundary wall, which, in our opinion, it would be very advisable to do, if it could be accomplished.

The soldiers' latrines, kitchens, &c. are situated in separate buildings, on the same line as the barracks.

The large central square is unequally divided by temporary wooden stables extending across it, and nearly in its centre is a large, well-built, ablution house, with water tank, baths, foot pans, basins, &c.

The permanent buildings are all of brick. They were built in 1793. The soldiers' barracks were rebuilt in 1829, and the officers' quarters in 1841.

The ground occupied by the whole establishment is 7 acres 1 rood in area, and consists of gravel and clay. It is on the same level, and possesses the same natural means of drainage as the surrounding district. Formerly a noisome open brook used to run along one end of the ground. This brook is now arched over, and part of the barrack drainage goes into it; the ground so gained is within the barrack walls, and is used as a drying ground.

It is proposed, as we have been informed, to erect married soldiers' quarters on this ground. If the intention is to be carried out, it would be very advisable to leave a clear space for thorough ventilation between the ground over the brook and the floors of the rooms, to prevent any effluvia entering the buildings.

There are in all 40 soldiers' rooms and 12 serjeants' rooms in these barracks. Three of the latter are, however, misappropriated soldiers' rooms, which it has been found necessary to take from the men's accommodation, on account of the deficiency in non-commissioned officers' quarters, from the augmentation of the cavalry regiments.

The rooms, as already stated, are over the stables, a very objectionable arrangement. Half of the rooms face towards the barrack square, and half towards the boundary wall. Between the two ranges of rooms is the usual long, narrow, badly-lighted, and unventilated wooden corridor, with doors opening right and left into the soldiers' rooms close to the fire-places.

These corridors are, however, much superior in one respect to those in most other cavalry barracks, from having shafts the whole breadth of the corridor, carried up at intervals to the roof, where a large skylight is placed to admit light; but for want of ventilation, which could be easily supplied at these skylights, the smell in the corridors at night is stated to be at times most sickening.

There are two other skylights in each range, which are imperfectly used for lighting, as their light is not properly admitted into the corridor; we would advise plastered shafts to be carried up to each of these skylights from the corridor, as has been done with the others, and that every skylight should have a space below it, properly protected from the weather, to admit of a free current of air passing at all times up the shafts from the corridor. This would much improve the ventilation of the whole buildings.

The barrack-rooms are all of a size, and they contain each 10 men with a cubic space of 494½ feet per man. The total regulation accommodation, as compared with what the accommodation would be at 600 cubic feet per man, is as follows:—

| Rooms. | Total Regulation Number of Men. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 40 | 400 | 320 | 80 |

By placing eight men in each room instead of 10, the present number, a trifle more than 600 cubic feet per man will be allotted to each. The deficiency in accommodation is that for 80 men, but there are three rooms, capable of containing 24 men, misappropriated for serjeants' rooms. If these were restored to their proper use, the deficiency in accommodation would be for 56 men.

The whole of the barracks are sewered into the town drainage of Manchester, and none of the sewers pass under any of the buildings. The drains are stated to be all trapped.

The water supply is derived from six pump wells, and from three rain-water tanks.

These wells are in the immediate vicinity of the stables, and derive their water from the soakage of the surface-water in a district where the soil cannot be considered as free of organic matter.

The supply falls short at times, and a new well is being sunk at no great distance from the sewer brook already mentioned.

These wells are not necessary for supplying the barracks.

The town of Manchester has an excellent water supply, certain mains of which pass close to the barrack gate.

The canteen being an occupied dwelling, is supplied with this water. On a recent occasion, the well water became deficient, and the men had to procure water from the canteen, for supplying which the owner was fined 10*l.* by the city authorities.

As certain defects in the privies and drainage are intimately connected with this state of the water supply, we are decidedly of opinion that sufficient water for all sanitary purposes should, in future, be obtained from the corporation waterworks. The water is at the barrack gate. All that is required is to bring it inside.

Each stable is ventilated by a round hole at each of the four corners, as well as by the windows; but we do not consider these arrangements sufficient as far as regards the barrack-rooms above.

The disadvantage of barrack-rooms over stables is twofold, as regards ventilation. If the stables are not ventilated, and the ceilings are not absolutely impervious, the effluvia pass through the ceilings into the rooms above; and if they are ventilated solely by windows and openings in the walls, the effluvia, after escaping from the stable, pass in by the barrack-room windows.

To prevent both results, as far as practicable, it is necessary to ventilate the stable by shafts, or iron

pipes, carried above the roof of the building from each of the four corners of the stable, and this we beg to recommend in the present instance.

Each shaft should give an area of 12 square inches per horse, and should be carried up outside the stable to a height of 3 or 4 feet above the eaves.

Perforated glass should be put into the upper window panes of each stable, to supply fresh air.

The barrack-rooms above require ventilation, to effect which a shaft, with a sectional area of 12 square inches per man, should be carried up from the corner of each room above the roof, and protected by louvres.

There is an opening in the ceiling of each room, at present; but as it only enters the space under the slates, the ventilation is not sufficient.

Inlets for fresh air, protected by short perforated zinc cornices for diffusing the inward current, and with valves for regulating the current, ought also to be provided near the ceiling.

All the latrines are in a bad and offensive condition. They are a long way from the barracks. They are much too small, and too narrow. They are dark and foul; the receptacle is not properly constructed; and although they are connected with the town drainage by 9-inch pipes, there is not a sufficient water supply to keep them free of smell, or to keep the pipes free from obstruction.

The latrines require reconstruction, with a proper water receptacle and flushing apparatus, such as is used in the London cavalry barracks. They require more light, roomy buildings, and more seats, with divisions and half-doors, and there must be sufficient water to fill and flush them once or twice every day.

The urinals are not supplied with water for cleansing or flushing. This defect requires remedy.

There are two cook-houses, one on each side of the parade ground. Each is provided with ten boilers. But there are no means of roasting meat, and the buildings are very deficient in light.

Each kitchen requires a roasting oven, and glass louvres at the ends.

There is no laundry. There is a women's wash-house. It is dark from want of a skylight, which could be easily inserted; and it has no drying stove.

These barracks contain the usual cavalry barrack workshops. They are rather small, and they require ventilation. It would be desirable to convert the armourer's shop into a saddle-tree maker's shop, and to erect another armourer's shop.

The school-room is defectively ventilated. It requires a ventilating shaft at each end, and inlets for air protected by perforated zinc covers over the windows, or by perforated glass panes at the top of each window.

The ash-pits in these barracks are too close to the rooms. They ought to be abolished, and the whole barrack refuse collected and removed in iron carts, as recommended in other cases.

The stable manure depôts admit of much improvement. They should be paved, reduced in size, and arrangements made for the more frequent removal of the manure.

The guard-room is dark, and unventilated, and has a flagged floor.

The orderly room is complained of as too small, and a second room for clerks is considered necessary.

The whole buildings are lighted by gas, which is a great convenience.

There are no cleaning-rooms, and no covered sheds for drill.

*The following are the Sanitary Improvements required for Hulme Barracks:—*

1. Reduction of number of men in the barrack-rooms to the extent recommended.

2. Ventilation of the stables by shafts and inlets for air.

3. Ventilation of the corridors to be improved by additional lighting shafts, carried from the ceiling to the existing skylights, and by providing permanent ventilation under all the skylights. Ventilation of every barrack-room by a shaft and inlet for air, as described above.

4. Ventilation of the guard-room and school-room in a similar manner.

5. Ventilation of all the workshops and library by a large Arnott's silk flap ventilator into the chimney, and by ventilating panes in the windows.

6. Reconstruction of all the privies, and their conversion into water latrines, with divisions, half-doors, &c., as recommended. Also the urinals to be supplied with water for cleansing.

7. Kitchens to be supplied with roasting ovens, and to have additional windows, with louvred panes, for light and ventilation.

8. Women's wash-house to be supplied with drying stove, and to be better lighted.

9. Lavatory to be supplied with foot gratings, pegs, and forms. Bath accommodation to be increased to the extent of one bath for every 100 men.

10. Ash-pits to be replaced by iron carts, and stable manure to be more frequently removed.

11. Paving of the long back yards behind the stables to be relaid with square sets, and suitable gutters for surface drainage.

12. Introduction of the town water to all parts of the barrack.

13. A day-room for the men ought to be provided.

*Cavalry Hospital, Hulme.*

The cavalry hospital is situated at one corner of the barrack yard, in rather a close situation, and without a free circulation of air round it.

It contains seven wards and 40 beds. Four of the wards have windows on both sides, and three have windows on one side.

The space per bed is about 1,100 cubic feet on an average, and is so near the amount required by our instructions that we do not consider it needful to make any reduction in the number of beds, until at least certain improvements in the ventilation, which we shall presently suggest, are tried.

The wards have no ventilation except what may be casually obtained from doors, windows, and fireplaces, and we do not consider this to be enough when the deficient height of the wards, which is only 11 feet, is considered.

We would propose to remedy this defect by carrying from the ceiling of each ward to the roof a ventilating shaft, protected by louvres, and by introducing fresh air by inlets near the ceiling.

The wards communicate by means of a corridor, which ought to be independently ventilated by a shaft at each end carried to the roof of the hospital, and by an inlet for air so arranged that during cold weather the air would be made to pass over a fire-brick surface, heated by a stove, before entering the corridor. By this plan the whole mass of air in the hospital might be preserved in a state of warmth during winter. There should be a communication opened between the wards and the corridor to enable the fresh warm air to enter and diffuse itself through the former.

Each ward is warmed by a large grate, but the fire place and chimney are so wide and open that most of the heat escapes up the chimney, and the smoke enters the wards.

There are no water-closets in the hospital. There is a privy for the patients, with flushing arrangements, in the yard behind the hospital. It can only be reached by the sick leaving the building and walking across the back yard in all states of the weather. Proper water-closets are required.

There is a privy belonging to the itch ward, which has no ventilation except into a species of closed vestibule opening into the itch ward.

The hospital ash-pit is situated under the same roof as this privy and ward, and has its ventilation also in common with them.

The ash-pit must be abolished and the refuse removed daily.

The privy ought to be converted into a water-closet, and properly lighted and ventilated through the roof.

The surface of the back yard is imperfectly drained, and water is apt to lie on it after rain.

Water for the hospital is procured from a well. It is said to be good; but the building should certainly be supplied from the city water mains along with the rest of the barracks.

There is a bath-room, but the bath accommodation requires to be improved by providing fixed baths with hot and cold water laid on.

There is no lavatory accommodation, a defect which should also be supplied.

The wards are lighted by tallow candles, as is also the surgery.

There is gas in the hospital, and it ought to be led into the wards and surgery, where it would be a great boon.

There is no provision or bedding store, and no coal shed. The windows of the pack store require gratings for protection.

There is no accommodation for the sick of soldiers' families.

The kitchen is dark and is not sufficiently ventilated.

The urinals require water being laid on.

*The Sanitary Improvements immediately required for this Hospital are:—*

1. Ventilating all the wards and corridors by shafts and inlets as described, and by supplying warm air during winter through stoves in the passages.
2. Remodelling the fire-places in the wards to warm a portion of the air admitted.
3. Improved drainage of the back yard.
4. Removal of ash-pit, and conversion of the privy of the itch ward into a water-closet, with light and ventilation.
5. Water-closets, urinals, and lavatories to be constructed for each flat of the hospital, and a fixed hot and cold bath to be supplied to the bath-room.
6. Kitchen to be lighted by additional window space, and ventilated by louvres in the roof.
7. Present urinals to be supplied with water.
8. Stores to be improved or supplied where wanting.

Lastly. It would be very desirable to provide a room in some convenient position, not in the hospital (where there is no accommodation), for receiving the sick of soldiers' families.

## 2. SALFORD INFANTRY BARRACKS.

These barracks are situated on the outskirts of the borough of Salford, in a comparatively open situation.

They are built in blocks, called the right and left wings, and arranged in a square, having soldiers' barracks on two opposite sides; officers' quarters and the hospital on a third side; opposite which, on the fourth side, are the barrack offices and a large school-room.

The latrines, lavatories, wash-houses, kitchens, &c. are arranged behind the barrack buildings, and close to the boundary walls.

The total area occupied by the barracks is 8 acres, 3 roods, 27 perches.

The present buildings were erected in 1820–21. They are of brick, standing in a gravelly subsoil.

The barrack is drained into the town sewers, and the town water was about to be introduced at the time of our inspection, in lieu of well water, with which the barrack has been previously supplied.

The arrangement of the barrack-rooms differs in different blocks. In all, the rooms go from back to front of the block, but in one wing the staircase giving access to the upper rooms, as well as the passages, are taken out of the rooms by wooden partitions, an arrangement which deprives the rooms of windows, and makes their internal structure more complicated than it ought to be.

In these rooms also a non-commissioned officers' bunk is placed in one corner of the barrack-room, and partially obstructs the light of another window.

In the other blocks the rooms are reached by passages and staircases, extending from back to front of the buildings, with a non-commissioned officers' room on the landing. This is a much better arrangement than the other, because the ventilation is better and the light more abundant.

The whole barrack is intended to hold 938 non-commissioned officers and men. The men's rooms are somewhat overcrowded, as the following table will show:—

| Rooms. | Total Regulation Number of Men. | Total Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 41 | 574 | 492 | 82 | 14 | 12 |
| 11 | 176 | 132 | 44 | 16 | 12 |
| 9 | 135 | 126 | 9 | 15 | 14 |
| 61 | 885 | 750 | 135 | — | — |

The average cubic space we have given per man for accommodating 750 men in the soldiers' rooms is somewhat under 600 cubic feet per man, but even at that rate there are 135 more men in this barrack than the rooms ought to hold.

It will be necessary, therefore, to remove two men out of each room in the first set in the table; to remove four men out of each room in the second set; and one man out of every room in the third set.

None of the rooms are thoroughly ventilated, although they have openings in the ceilings, and it will be necessary to provide a shaft from the corner of each room, carried above the roof, having a sectional area of 12 square inches per man for the rooms on the upper floor, and 11 square inches per man for the rooms on the lower floor, for carrying off foul air, and to provide inlets for fresh air, protected by perforated zinc near the ceiling.

The lavatories are good and have baths and foot-pans. It would be advisable to double the number of baths so as to provide one for every 100 men.

The lavatories require pegs and gratings.

The latrines are very offensive; they are drained and have water for flushing; but they ought to be converted into water latrines with half-doors and divisions, and suitably ventilated and lighted.

The urinals require water to be laid on.

The kitchens have no means of cooking except boiling. They require roasting ovens. They also require ventilation.

There is a wash-house with four boilers and sixteen tubs, but there is no drying stove. Properly speaking there is no laundry.

There is neither day-room nor covered shed for drill.

The water supply was derived at the time of our inspection from wells and rain-water tanks, but, as already stated, the town water was about to be introduced.

There are two school-rooms, one is a large, excellent room, but it requires ventilation by tubes in the roof.

The whole barrack is lit by candles, in lieu of which gas, with ventilated burners, ought to be introduced.

All the drains are stated to be properly trapped, and they do not pass under the buildings.

The guard-room is imperfectly ventilated, and requires improvement in this particular.

There are large and offensive ash-pits belonging to these barracks, which ought to be done away with, and the refuse collected and removed in iron carts.

*The following are the Sanitary Improvements required for this Barrack :—*

1. Reduction of number of men to the extent indicated.
2. Ventilation of every barrack-room by a shaft and inlets for air, and also of the school-room, guard-room, and cook-houses.
3. Increase of bathing accommodation, and pegs and gratings to be provided for the lavatory.
4. Latrines to be reconstructed, with proper water receptacles ; water to be laid on for flushing, also divisions and half-doors to be provided, and additional ventilation and lighting to be introduced. Urinals to be provided with water.
5. Kitchens to be provided with roasting ovens.
6. Wash-house to be provided with drying stove.
7. Ash-pits to be done away with, and refuse to be collected and removed daily in iron carts.

Lastly. Married quarters are much wanted in this barrack, and it would be a great improvement to light the whole of it with gas. Day-rooms and drill sheds are also required.

*Salford Barrack Hospital.*

This hospital is situated at one corner of the barrack square. It is built in the form of the letter E, the wards forming the projections at each end of the centre. The wards are connected by a passage at the back of the building, out of which the surgery and store room open. The kitchen and offices are in the back yard, and are connected with the main building by a covered passage.

The hospital contains 12 wards and 93 beds.

The following is the accommodation as contrasted with what it would be at 1,200 cubic feet per bed :—

| Wards. | Total Beds. | Total Beds at 1,200 Cubic Feet each. | Deficiency of Bed Space. |
|---|---|---|---|
| 1 | 10 | 5 | 5 |
| 2 | 12 | 8 | 4 |
| 3 | 12 | 8 | 4 |
| 4 | 10 | 5 | 5 |
| 5 | 10 | 6 | 4 |
| 6 | 12 | 8 | 4 |
| 7 | 12 | 8 | 4 |
| 8 | 10 | 6 | 4 |
| Small Wards. | | | |
| 1 | 1 | 1 | — |
| 2 | 1 | 1 | — |
| 3 | 1 | 1 | — |
| 4 | 2 | 2 | — |
| 12 | 93 | 59 | 34 |

In order to set aside 1,200 cubic feet for each patient, it will be necessary to remove 34 beds out of the wards, which will give as nearly as may be, 1,200 cubic feet for each of the remaining 59 beds.

There are ventilating apertures in the ceiling of each ward, but it would be advisable to insert proper shafts, carrying them up to the roof of the building.

The window sashes open on pivots, an arrangement which is objected to. They should be made to draw down at top, in the usual way.

There are no water-closets belonging to the hospital. There is a privy in the yard behind, which the sick must reach by walking exposed in the open air.

The privy in the yard is very offensive, and requires to be reconstructed as a water latrine.

Water-closets are required for each flat. We believe this improvement has been already decided on.

There is no bath-room. One is much needed, having proper baths and hot and cold water laid on. A lavatory is also much wanted. At present the sick must wash either in the wards or in the open air.

The kitchen is in the back yard, behind the hospital. It is very imperfect, and requires a proper cooking range.

There is an ash-pit in the back yard which ought to be removed, and the kitchen refuse collected and taken away daily, with the other refuse of the barrack.

Water is at present derived from a well, but as the town water is about to be introduced, this defect will be remedied.

The fire-grates in this hospital, like those in most other hospitals, are not of a good construction, and waste a great deal of heat. Better grates are required.

There is gas in the hospital, but none in the wards. This defect should be remedied.

There is no room for orderlies.

There is no accommodation for the sick wives and children of soldiers.

*The following are the Sanitary Improvements required for the Hospital :—*

1. Reduction of beds, as stated.
2. Ventilation of every ward by a shaft from the ceiling carried up to the roof, and by a perforated glass pane in each window.
3. Water-closets, lavatory, and bath-room, with hot and cold water laid on, to be provided within the hospital. Water latrines to be constructed in lieu of the privy.
4. A new kitchen cooking range (one of Howell's, or Burridge and Headle's) should be provided.
5. The ward grates might be advantageously remodelled, so as to admit warmed air into the wards in winter.
6. Gas to be introduced into the wards.
7. Ash-pit to be removed.

Lastly, it would be very advisable to provide a room for sick women and children.

## 3. BURNLEY BARRACKS.

These barracks are situated in an open, healthy locality, on the summit of a hill, about a mile and a half from the town of Burnley. The surrounding ground is almost entirely free from houses.

The barracks are constructed to accommodate 118 cavalry, and 136 infantry, non-commissioned officers and men.

The buildings occupy three sides of a square, 5 acres and 9 perches in area, the canteen hospital, and a fives'-court filling up the fourth.

The officers' quarters occupy one end of the square.

Between the buildings is an extensive parade ground, which would be very much improved by additional drainage, gravelling and rolling.

The water supply is derived partly from the Burnley water-works, partly from pumps, and partly from rain water tanks. The buildings are partly drained by pipe drains, carried to an outlet near the barrack gate ; but part of the drainage is received into cesspits, one of which is close to the hospital wall. It is intended to economize foul water for flushing the hospital privy. The arrangement is so very bad an one, that we beg to recommend its prohibition. All cesspits ought to be filled up, the drainage properly disposed of, and the water supply from the town waterworks increased to the amount required for all purposes.

*Cavalry Barracks.*

The rooms in the cavalry barracks are built over the stables.

The stables are narrow, and defectively ventilated.

The ventilation requires to be improved by shafts, carried up at each side from the ceiling of the stable to above the roof of the barrack, and by perforated panes of glass in the windows to admit fresh air. Additional light should also be admitted to the stables.

The barrack-rooms open on either side out of a central passage, which is dark and imperfectly venti-

lated. A ventilating skylight, between the centre of this passage and each end, should be provided in the roof, opening through the ceiling of the passage. These skylights would afford the necessary light and ventilation.

The barrack-rooms are partially ventilated by means of hollow beams, but the smell of the stables in them was most offensive.

These rooms require shafts and inlets for additional ventilation.

The following is the amount of accommodation in the cavalry barracks :—

| Troop Rooms. | Total Number of Men according to existing Regulations. | Total Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Mn. |
|---|---|---|---|
| 12 | 108 | 72 | 36 |

The accommodation is, therefore, deficient 30 per cent., and the total number the barrack will hold is seventy-two men. Each room is capable of containing six men instead of nine, its present complement.

The ablution-room has no bath, and no gratings nor pegs ; one bath should be supplied. The ablution-room is too small for both purposes, but it might be enlarged by adding to it the saddler's shop, which is unsuited to its purpose, and building a new saddler's shop.

The present saddler's shop is very dark, and having no fire-place it cannot be used in winter.

The cook-house is in a building projecting from the barracks, and is entered from the passage, in which is the staircase giving access to the barrack-rooms. Above it is a serjeant's room. There is no oven in the cook-house, and the boilers require reconstruction.

A cooking range, with an oven, would be applicable to this kitchen.

The privies are in a bad condition. They are not flushed daily, and water does not stand in them. They should be reconstructed, and converted into water latrines, with proper flushing arrangements. Seats with divisions, half-doors, and additional means of lighting are also required.

The urinals should be supplied with water.

The manure heap at the back of the cavalry barracks was full, and very offensive at the time of our inspection.

The ash-pit was also objectionable.

For both of these an iron cart, for daily collection and removal of the refuse, should be substituted.

The daily collection and removal of manure and refuse is the more necessary in this instance, as the offices connected with these barracks, and also the manure heaps and ash-pits, are situated against the boundary wall, close to the stables and barrack-rooms, from which they are separated by a narrow, badly paved, and ill-drained yard, in a very filthy state.

This passage ought to be well paved with square setts, and properly drained. If this were done, it would be possible to keep the surface clean.

These narrow back yards are common to almost all cavalry barracks, and, from the very objectionable plan of lodging the men over the horses, it is usual to see manure heaps, privies, ash-pits, urinals, &c., congregated together as in the present case, close under the barrack-room windows, and perhaps the kitchen, as in these barracks, in the middle of them. Were there space enough, conveniently situated, we should feel disposed to advise the whole of these offices to be removed and reconstructed at a safe distance from the barracks.

*The following are the Sanitary Improvements we would recommend :—*

1. Reduction of numbers of men in each room to the extent stated.

2. Ventilation of the stables by air shafts and perforated glass panes ; ventilation of the sleeping rooms by shafts and inlets ; ventilation and lighting of the passage by skylights.

3. Reconstruction of privies, and substitution of water latrines with flushing arrangements, divisions of seats, half-doors, and additional light. Urinals to be supplied with water.

4. Roasting oven to be provided for the kitchen, and boilers to be reconstructed.

5. Ablution-rooms to be enlarged, and supplied with pegs and gratings, and with a bath and foot pans.

6. Back yard to be repaved with square sets and guttered.

7. Ash-pit to be removed. Iron carts and daily removal of all manure and other refuse to be substituted.

8. New saddlers' shop to be provided.

*Infantry Barracks.*

The infantry barracks are constructed to accommodate 136 men ; they are two stories high. The barrack-rooms open out of a passage and staircase, which are placed between every two rooms on each floor. The rooms are overcrowded, and the means of ventilation are defective. The following is the accommodation :—

| Soldiers' Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 11 | 132 | 77 | 55 |

Each room has regulation accommodation for 12 men, with about 350 cubic feet per man, while there is accommodation for no more than seven men at 600 cubic feet per man. It will be necessary, therefore, to remove the excess of men out of these rooms.

To improve the ventilation, each room requires an air shaft and inlets for air. Remodelled grates, for warming the air in winter, would be an advantage.

The urinals have no water.

The privies require reconstruction on the principle recommended above for the cavalry barracks.

The cook-house requires a shaft up through the roof for ventilation, and inlets for air by perforated panes or otherwise. It has no means of cooking except by boiling.

The ash-pit is objectionable. It should be done away with, and removal of the refuse by an iron cart substituted.

The ablution-room has no gratings nor pegs.

There are no baths.

The guard-room and the lock-up room want ventilation ; shafts could be carried up by the side of the chimney, and inlets for air should be provided.

The cells are not good, but they are ventilated, and the passage is warmed by a stove.

The women's wash-house requires a grating for the feet, and it has no drying stove.

These barracks contain accommodation for four married non-commissioned officers, but there is no accommodation for married soldiers.

The exterior of the whole barrack is lit with gas, but all the rooms, both on the cavalry and infantry side, are lit with candles. It would be a great advantage to introduce gaslight throughout.

*The following are the Sanitary Improvements required :—*

1. Reduction of number in every barrack-room as stated.

2. Ventilation of every barrack-room, of the guard-room, and lock-up, and of the kitchen by shafts and inlets for air. Grates to be reconstructed to warm the admitted air.

3. A roasting oven for the kitchen.

4. A bath, foot-pans, gratings, and pegs to be provided for ablution house.

5. Reconstruction of privies into water latrines with flushing arrangements, divisions of seats, half-doors, and improved light and ventilation. Urinals to be supplied with water.

6. Removal of ash-pit. Refuse to be collected and removed by iron cart.

7. Drying stove and foot grating for women's wash-house.

Lastly. Both cavalry and infantry barracks should be lit with gas, and day-rooms and covered drill sheds provided.

*Burnley Hospital.*

The hospital is a small ill-constructed building; hardly suitable for treating serious cases of disease.

The wards are low and overcrowded, and their ventilation is defective. They are so small that the ventilation might be sufficiently improved by introducing a large Arnott's silk flap ventilator into the chimney, along with perforated panes in the windows. The grates might be remodelled with advantage, so as to admit warm air to the wards during winter.

The kitchen requires an oven.

There is no fixed bath.

There is no water-closet.

The privy wants ventilation at the top. A large cesspit, which receives the refuse water from the women's wash-house for purposes of flushing, should be done away with, and sufficient water for flushing provided.

*The following are the Sanitary Improvements we would recommend:—*

1. Reduction of beds, so as to give as nearly as may be 1,200 cubic feet for each bed.

2. Ventilation of wards as described.

3. Construction of a suitable water-closet, improvement of existing privy, and abolition of the cesspit.

4. An oven for the kitchen.

5. A fixed bath, with hot and cold water laid on.

## 4. BURY BARRACKS.

These barracks occupy an airy, healthy position, at a short distance from the town of Bury.

They contain accommodation for cavalry and infantry, and the buildings are so arranged as to leave a spacious square in the centre, suitable for a parade ground.

The area enclosed within the boundary wall is seven acres. The subsoil consists partly of clay, and partly of gravel and made ground, and there are no local sources of malaria in the neighbourhood.

All the buildings are of stone and were erected in 1845.

This barrack appears to us to be a favourable specimen of healthy barrack construction, although there are some points in which improvements might be made.

The cavalry barracks occupy one block of building, extending nearly the whole length of one side of the square. The infantry barracks occupy the corresponding block on the opposite side. The remaining two sides are formed by the officers' quarters and hospital, and by the prison, guard-room, barrack offices, &c.

Behind each block of barrack-rooms is a broad, well paved court, with an excellent range of one-story buildings, containing the cook-houses, lavatories, stores, &c., behind which, and close to the boundary walls, are the latrines, ash-pits, and urinals.

An arrangement such as this, by which the latrines and urinals are removed to a sufficient, but not to too great a distance from the barracks, and concealed by an intervening range of outhouses, is one worthy of imitation.

The cavalry barracks have the soldiers' rooms over the stables, which is an arrangement always to be avoided if possible, but at the same time the evils resulting from it have been materially diminished in the present case by ventilating each stable by a shaft carried up in the chimney stalk, and by the manner in which the rooms above have been arranged.

The usual means of access in cavalry barracks is by a long dark corridor, as at the Hulme barracks, described above, running from end to end of the range, with the barrack-rooms opening right and left out of it. This arrangement is prejudicial alike to the health and comfort of the men.

In the Bury barracks, on the contrary, access to the rooms is obtained by wide, roomy, well-lighted and ventilated stone staircases, occupying the whole breadth of the building, with ventilation by open door-ways right across the building, and dividing it, in fact, into a number of separate blocks under one roof.

The infantry barracks are constructed on a similar plan, except that the lower rooms are used as barrack-rooms.

Both Cavalry and Infantry Barracks have no more than two floors, another excellent feature in the construction.

The whole barrack contains regulation accommodation for 338 non-commissioned officers and men; and there are in all 20 barrack-rooms with the accommodation shown in the following table: —

| Rooms. | Total Regulation Number of Men. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 8 | 128 | 104 | 24 | 16 | 13 |
| 4 | 64 | 64 | — | 16 | 16 |
| 8 | 120 | 96 | 24 | 15 | 12 |
| 20 | 312 | 264 | 48 | — | — |

Each of the first series of eight rooms contains three men more than it ought. The same is the case with the last eight rooms. There are four rooms which contain the proper number of men.

There are several unoccupied rooms, into which part of the excess of men might be drafted, which would reduce the number otherwise to be provided for.

All the barrack-rooms have four good sized windows, two at each end, but in each of the lower rooms, on the infantry side, a compartment is partitioned off in one corner for a non-commissioned officer, an arrangement which ought to be avoided, as it interferes with the light of one window, encumbers the room, and tends to obstruct its ventilation. If the non-commissioned officer is married, his wife uses the barrack-room fireplace for cooking and heating irons.

In the upper flat this is avoided, by having the non-commissioned officers' room at the end of the staircase.

Each barrack-room has a porch of wood within it. There are no shelves, and the top of the porch is used instead.

It would be advantageous to put up shelves between the windows at each end of the room.

There are no means of ventilation, except by doors and windows. We would recommend the introduction of a ventilating shaft with inlets, as already described, into each room, and also reconstruction of the grates to admit warm air during winter.

The barrack-rooms are lit by candles. Gas ought to be introduced instead.

There are no day-rooms for the men, nor covered sheds for drill.

There are two good detached lavatories, one on each side of the barrack. They are provided with benches, basins, foot-pans, and bath accommodation.

These arrangements are excellent, so far as they go, but it would be advisable to provide an additional bath on the infantry side, and both the ablution-rooms should have gratings for the men to stand on, and pegs for their coats.

There is no laundry. There is a women's wash-house, but it has no means of drying or getting up linen. A drying stove is required.

There are no married quarters. There are two cook-houses, one has eight boilers and the other three. There are no means for roasting or baking meat. A suitable roasting oven should be put up in each kitchen.

The water supply is derived from four rain-water tanks, and from seven pump wells. Certain of these wells are close to the privy cesspits, and become occasionally impure, apparently from soakage. The quantity of water is not sufficient for present use, and an additional supply will be required for the improved drainage we are about to recommend.

The town of Bury has extensive waterworks, and its mains come up to the toll bar at a short dtstance from the barracks. The town water is in fact laid on for the building operations at the new militia stores, close to the barracks.

Whenever water can be obtained from mains it ought to be laid on to all barracks, and we would recommend this being done in this instance also.

The great defect in these barracks is their want of sewerage. In fact they have none, except surface drainage, and the latrines are, consequently, in a condition which affords a very unfavourable contrast with the other arrangements of the buildings.

The latrines are placed against the walls behind the barrack offices, and are very well placed so far as the plan is concerned, but they are very offensive, and require reconstruction. Immediately outside the wall are immense cesspits, into which all the drainage passes, and accumulates till it is pumped out and carted away.

There are no town sewers close to the barracks into which the drainage could be carried. The same defect exists at the adjoining militia buildings ; but we understand it is intended to carry the drainage from these buildings to the river, through the adjoining fields. A similar course might be taken in draining the barrack without danger. The barrack drainage might be connected with the militia store drainage. The river, which is the natural outlet, at present receives a large amount of drainage from town population as well as from factories, and the small additional quantity from an establishment with 338 men would increase its present impurity to a very small extent indeed.

So far as the mere practical question of getting rid of the drainage is concerned, it might very well be done in this way. At the same time, we are of opinion that in all public proceedings of this kind it is well to avoid objections if possible. It has been justly objected that water streams have been unnecessarily polluted by draining houses into them. Nevertheless, the houses must be drained. It is not for a moment to be admitted that the ground on which a house stands is to be saturated with cesspool matter, whatever becomes of the drainage. The first thing is certainly to get it removed away from the house. But there is no necessity to pollute water streams with it. Sewage manure is very valuable in fertilizing grass land ; and it would be advisable, with regard to detached barracks, generally, to inquire whether the sewage could not be removed to a sufficient distance to leeward of the buildings, and there applied for irrigation ; or, if suitable land cannot be obtained, whether a tank might not be constructed for receiving and deodorizing the drainage at a distance from the barracks, the deodorized overflow from which might be allowed to pass into any stream with safety. The question is one of importance, as cases have come under our notice in which there appears to be no other way of disposing of the sewage. In either case a proper tank would have to be constructed, into which the periodical flushings from the barracks could be conveyed by pipe drains.

There are two such reservoirs or cesspits immediately outside the barrack walls at Bury. They are of considerable dimensions, and contained a large quantity of fluid at the time we saw them. In our opinion both of these tanks ought to be removed to a greater distance, and some means provided for disposing of the fluid part. The latrines urgently require improvement, and unless the drainage be improved, as suggested, it will be impossible to make the needful alterations in them.

They require to be supplied with proper soil-tanks, in which water will always remain at a certain level, and which can be flushed out once or twice a-day into the sewers. They should be supplied with divisions and half-doors. They should be ventilated at the roof, and lighted from above in the ratio of not less than one and a half square foot of glass for each seat.

It is stated that the urine is taken away for dyeing by the manufacturers of the neighbourhood. We see no objection to this, if suitable iron tanks be provided outside the barrack walls, into which it can be received along with the contents of the urine tubs.

The ash-pits are uncovered, and are open to the usual objections. It would be very desirable to substitute iron carts for them, and to remove the refuse daily.

The manure pits behind the cavalry stables are too deep and require drainage.

The guard-room has no separate place for prisoners. It has no sufficient ventilation.

There are two orderly rooms adjoining each other. It has been suggested that it would be an improvement to have a door through the wall, to enable them both to be used by the commanding officer when there is only one regiment in barracks.

The officers' quarters require sanitary improvements in their drainage, similar to those recommended for the barracks. The ash-pit belonging to them should also be removed, and an iron cart substituted for daily collection of the refuse.

*The following are the Sanitary Improvements required for the Barracks:—*

1. Reduction of numbers in the barrack-rooms to the extent stated above.

2. Every barrack-room, and the guard-room, to be ventilated by shafts and inlets for air.

3. Lavatories to have gratings for the feet, and pegs to hang coats on, and an additional bath to be placed in the lavatory on the infantry side.

4. Women's wash-houses to have drying stoves provided.

5. Cook-houses to be supplied with roasting ovens.

6. A better water supply to be provided, by bringing in the town water.

7. Reconstruction of privies by converting them into water latrines, and removing the drainage to a distance in one of the modes suggested. Also supplying the latrines with divisions and half-doors, light, and ventilation.

8. Iron carts to be substituted for the ash-pits, and manure depôts to be improved as suggested.

9. It would be a great improvement if gas were introduced, and a ventilated gas-burner placed in every barrack-room.

Lastly, day-rooms and covered drill sheds should be provided, and married quarters built for the regulation number of married soldiers' families.

*Hospital, Bury.*

The hospital stands on one side of the barrack parade ground in a line with the officers' quarters.

It has four wards and 30 beds, with the defi-

ciency of accommodation shown in the following table :—

| Rooms. | Present Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency in Bed Space. |
|---|---|---|---|
| 1 | 6 | 4 | 2 |
| 2 | 9 | 6 | 3 |
| 3 | 9 | 6 | 3 |
| 4 | 6 | 4 | 2 |
| 4 | 30 | 20 | 10 |

The accommodation at 1,200 cubic feet per bed is only sufficient for twenty beds.

None of the wards are ventilated; they require shafts to be carried up from the ceilings to the roof, and inlets for air near the ceiling properly protected by perforated zinc. To enable sufficient ventilation to be kept up during winter, we would recommend the grates to be reconstructed, with fire-brick compartments behind each grate, through which the air could be admitted warm into the wards.

There is no water-closet in the hospital. The only accommodation of this kind for the sick is an offensive privy in the back yard, which is drained into one of the large cesspools already described.

Proper water-closets are required, and should be built out from the first floor of the hospital.

Another of these privies adjoins the itch ward, and the effluvia from it was strongly perceptible in the ward. This privy should be converted into a water-closet, and the privies in the back yard into a water latrine.

There is no lavatory for the sick. In summer they wash in a shed in the back yard, and in winter they wash in the bath-room, which is dark, and not provided with suitable conveniences.

This bath-room is situated on the ground floor, and has no light except what it derives from a corridor which occupies part of the front of the building.

There is no fixed bath in the bath-room, and no copper for heating water. There is only a slipper bath in it.

This room might be made sufficient for both bath-room and lavatory by being properly fitted up with slate benches, basins, a fixed bath having hot and cold water laid on, and with a shower bath.

The only water supply to the hospital is from a rain-water tank in the back yard, or from the nearest barrack pump.

It should be supplied by the town water.

The kitchen is under one of the wards, and should be ventilated by a shaft carried up to the roof. It requires a bracket for roasting, and the boiler in the scullery is stated to be out of order.

The passages are lit with gas, but there is none in the wards. This defect requires remedy.

There is no hospital accommodation for the sick of soldiers' families.

*The following are the Sanitary Improvements required for this Hospital :—*

1. Reduction of number of beds, and allotting 1,200 cubic feet to each.
2. Ventilation of the wards by shafts and inlets, and reconstruction of grates, as described. Ventilating shaft for the kitchen.
3. Water-closets to be built out, with access from the first floor of the hospital. Privy of the itch ward to be converted into a water-closet, and the privies in the yard to be converted into a water latrine.
4. Bath-room to be improved, and lavatory accommodation provided, as described.
5. Water supply to be provided.
6. Roasting bracket to be put up in the kitchen, and the scullery boiler to be repaired.
7. Wards to be lit with gas by ventilated burners.
8. A room to be set apart for the sick of soldiers' families.

## 5. STOCKPORT BARRACK.

This is a small barrack, intended for the accommodation of 172 non-commissioned officers and men. It was unoccupied at the time of our inspection. It consists of a single block of buildings, part of which is intended for officers' quarters. It stands in about an acre and a quarter of ground, on a loamy and gravelly subsoil, and in an elevated and healthy position, in the suburbs of Stockport.

Besides the barrack-rooms, the square contains the hospital, tennis court, magazine, cells, guard and orderly room, canteen, and the usual offices.

The building contains in all 10 barrack-rooms, of different dimensions, with regulation accommodation for 160 men.

The following table shows the manner in which the accommodation is allotted, as contrasted with what it ought to be if 600 cubic feet of space were set apart for each inmate :—

| Rooms. | Total Regulation Number of Men. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 4 | 64 | 48 | 16 | 16 | 12 |
| 6 | 96 | 66 | 30 | 16 | 11 |
| 10 | 160 | 114 | 46 | — | — |

The rooms may be classed as of two sizes, four of which are larger than the others. In order to give 600 cubic feet per man, as nearly as may be, it will be necessary to remove four men out of each by reducing the numbers from 16 to 12 men per room. The remaining six rooms being of smaller dimensions, although containing the same regulation number of men, will require to have the number of inmates in each reduced from 16 to 11 men.

The total deficit of accommodation is, therefore, for 46 men out of 160, leaving 114 men as the number which these barrack-rooms ought to contain.

Each room is lighted by a window at either end. The stairs are of wood, and are partitioned off from the rooms, an arrangement which is open to objection, because it interferes both with the light and ventilation of the barrack-rooms.

The rooms have ventilators in the ceilings, but they are not sufficient for health. We would propose to improve the ventilation by carrying up a foul-air shaft from the ceiling of each room above the roof of the barrack, and by providing inlets for air to be diffused through perforated zinc, near the ceiling.

The grates in these rooms are of the usual construction, and waste a large part of the heat. We have under consideration plans for improving all existing barrack grates, for economising heat and facilitating ventilation; and when our inquiry is completed, we propose to apply the results practically in all barrack-rooms and hospitals.

The water supply of the barrack is derived from pumps, although the Stockport Water Company's mains are said to pass close to the boundary.

This water ought to be introduced into the barracks, for it is only by doing so that the necessary drainage can be effectually carried out. Besides, the repairs of pumps, tanks, &c., form a large annual item in the cost of barracks, which would be mostly avoided by a better water supply.

The ablution-rooms require ventilation. They have neither gratings nor pegs to hang coats on.

There are no baths.

The cook-house is fitted up with six iron boilers, which might be advantageously reconstructed. There are no other means of cooking. A properly ventilated roasting oven is required.

The ventilation of the cook-house would be much improved by the introduction of perforated glass panes into the windows.

The privies are imperfectly constructed, and are offensive. We have been informed that the drain from them is carried to a distance, and the sewage is spread over land as manure. This should always be done where land at a suitable distance from inhabited buildings can be obtained. The privies should be reconstructed as water latrines, with suitable flushing arrangements.

The urinals require water to be laid on.

The women's wash-house requires a drying stove.

There is no foul bedding or straw store; and the straw for the beds being put into the loft of the officers' stables, is apt to be used for litter.

This barrack is lit by candles.

There is no day-room for the men.

There is no school-room. A barrack-room is appropriated as a school-room and library.

There are no store rooms.

There are no quarters for married non-commissioned officers or privates.

There are neither cleaning-rooms nor covered shed for drill. There is, however, a good tennis court.

The guard-room requires ventilation by a shaft and inlets for air.

*The Sanitary Improvements we consider necessary are as follow:—*

1. Ventilation of every barrack-room, and of the guard-room, by shafts and inlets, as described.
2. Reduction of numbers in each barrack-room, to give 600 cubic feet per man.
3. Ablution-room to be ventilated, and pegs and gratings to be provided. A bath, supplied with water, to be provided.
4. Cook-house to be ventilated by glass louvres in the windows. Boilers to be improved, and a roasting oven to be provided.
5. Privies to be reconstructed, and converted into water latrines, with means of flushing.
6. Urinals to be supplied with water.
7. A drying stove to be provided for the women's wash-house.

The other requirements, namely, a day-room, covered drill shed, school-room, cleaning-room, library, and married quarters, should also be attended to, and the barrack should be lit with gas.

*Stockport Barrack Hospital.*

This is a small, badly-constructed, and inconvenient hospital, situated at one corner of the barrack square, and only suited for cases of slight and very temporary illness. It consists of four wards, three of which are like small cottage rooms, and the fourth is larger. The accommodation is for 28 patients, but at 1,200 cubic feet per bed the wards would not, by any means, hold that number, as the following table will prove:—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| 1 | 11 | 5 | 6 |
| 2 | 11 | 4 | 7 |
| 3 | 3 | 1 | 2 |
| 4 | 3 | 2 | 1 |
| 4 | 28 | 12 | 16 |

The whole building contains accommodation for 12 beds instead of 28. The excess of beds, 16 in number, should therefore be removed.

Ventilation is provided for by openings in the ceiling, but they are very inefficient for the purpose. Shafts and inlets for air are required.

There is no lavatory. The men wash in the wards. The bath arrangements are defective.

There is no water-closet within the building, but there is an offensive latrine, without any water supply, in the yard outside, and partly under the hospital.

There is an ash-pit in the yard outside, too close to the wards.

The hospital staircase is tortuous and inconvenient, and the passages not properly lighted nor ventilated.

The kitchen is under one of the wards, and has no provision store. It should certainly be removed out of the building altogether.

There is no shelter for convalescents, and no accommodation for them within the building on account of its defective structure. There is no water-tap in the surgery.

It would not be advisable to incur much cost in improving this building, on account of its general unfitness for a hospital. There are, however, certain improvements which are indispensable, if sick are to be received into it even temporarily.

*These Improvements are as follow:—*

1. Reduction of numbers, and setting apart 1,200 cubic feet for each bed.
2. Ventilating wards by shafts and inlets for air.
3. Increasing the light and ventilation of the staircase, by opening an additional window at the end.
4. Providing a water-closet and bath within the hospital.
5. Converting the privies in the yard, under the hospital, into a water latrine.
6. Removing ash-pits, and providing for daily collection and removal of refuse.
7. Removing the kitchen from within the hospital, and providing another kitchen.
8. A water tap and sink are required in the surgery.

## 6. ASHTON BARRACKS.

These barracks are placed on an airy, healthy situation, about a mile and a half from Ashton. They are isolated from buildings, and occupy an area of seven acres, partly of clay, partly of made ground. They are of stone, and were built in 1845.

The general arrangement and construction on both cavalry and infantry sides are the same as those of the barracks at Bury. They have the same advantages, and their defects are similar.

They are constructed for 328 non-commissioned officers and men. The following table shows the barrack-room accommodation, as contrasted with what it would be at 600 cubic feet per man:—

| Rooms. | Present Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 8 | 128 | 104 | 24 | 16 | 13 |
| 3 | 48 | 48 | — | 16 | 16 |
| 8 | 120 | 96 | 24 | 15 | 12 |
| 1 | 6 | 5 | 1 | 6 | 5 |
| 20 | 302 | 253 | 49 | — | — |

There is thus in the infantry barracks a deficiency of accommodation for 49 men on the present construction. In the three cavalry rooms the space is upwards of 600 cubic feet per man.

All the barrack-rooms and the guard-room require ventilation by shafts carried up from the ceilings, and by inlets for air.

This barrack has a water supply derived from Ashton Waterworks. It was brought in on account of the well water being unwholesome, but from the smallness of the water pipe within the barrack yard, the quantity of water delivered is insufficient. This is a defect which ought to be remedied forthwith.

There is no drainage, except surface drainage, which is led into a watercourse close to the barrack. This watercourse empties itself into a reservoir between the barrack and the town of Ashton.

There is no drainage from the privies; their contents are led into large cesspits precisely similar to those at Bury, and placed immediately outside the barrack walls. The consequence is, that the privies are most offensive. They require to be reconstructed as water latrines, but before this could be done, it will be necessary to determine what is to become of the drainage. It would, in our opinion, be improper to turn it into the watercourse, even if there were no local objections to it, unless, indeed, a suitable deodorizing and filtering tank were constructed, in which case the fluid might be passed almost colourless into the stream, and the solid part might be removed and carted away. Unless the sewage could be applied to irrigate land at a sufficient distance from the barrack, it will be necessary to deodorize it in the manner stated.

The only other thing would be to pass it into the sewers of Ashton, if the distance be not too great. In any case, however, an outlet should be obtained, for the privies should not be allowed to remain as they are; they should be reconstructed as soon as possible, and should have divisions and half-doors, with additional light from skylights, in the proportion of one and a half square foot per seat. The urinals should have water laid on.

There are two ablution houses, with a bath and footpans in each. An additional bath and gratings are required.

There are two kitchens with boilers, but without any means of roasting meat. A proper roasting oven should be supplied to each.

There is no laundry; there are women's washhouses, with washing tubs and trays, but without drying stoves. One such stove is required in each wash-house.

The ash-pits in this barrack should be disused, and provision made for the daily collection and removal of the barrack refuse in iron carts.

The barrack is lit by candles. It would be a great improvement to introduce a ventilated gas-burner into every room.

There is a good school-room and library; they require ventilation. There is no day-room.

There are no married quarters; there is a good site available for them outside the barrack.

There is no covered shed for drill.

*The Sanitary Improvements we would advise for these Barracks are the same as those for Bury, and comprehend:—*

1. Reduction of numbers of men in the rooms, so as to leave 600 cubic feet of space per man.
2. Ventilation of the barrack-rooms, guard-room, school-room, and library by shafts and inlets for air.
3. An additional bath to be provided in one of the lavatories, and the lavatories to have gratings and pegs.
4. A drying stove for each wash-house.
5. A roasting oven for each cook-house.
6. Water supply to be improved by enlarging the barrack supply main.
7. Privies to be converted into water latrines, with suitable drainage for the disposal of the soil. Divisions of seats, half-doors, and sufficient light to be provided.
8. Barrack refuse to be collected and removed in iron carts, instead of being kept in ash-pits.

This barrack should be lit with gas, by a ventilated burner in each room.

Rooms for married soldiers are much required, as are also a day-room and drill shed.

*Ashton Barrack Hospital.*

This hospital is constructed on the same plan, and has the same accommodation, as the hospital at Bury, except that the wards are narrower.

It consists of four wards with offices, and a central staircase and corridor for affording access to the upper flat, on which the wards are placed. The following table shows the accommodation:—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Beds. |
|---|---|---|---|
| 1 | 6 | 3 | 3 |
| 2 | 9 | 6 | 3 |
| 3 | 6 | 3 | 3 |
| 4 | 9 | 6 | 3 |
| 4 | 30 | 18 | 12 |

The present wards would afford accommodation for no more than 18 sick, at an average of 1,200 cubic feet per bed.

The other defects are similar to those in Bury hospital:—

The wards are not ventilated.

There is no proper lavatory.

The bath-room requires a fixed bath, with hot and cold water.

There are no water-closets, but only privies in the back yard, inconveniently placed for the sick, and very offensive.

There is no accommodation for the sick of soldiers' families.

The wards are only lit by candles, although there is gas in the passages.

*To remedy these Defects we would recommend:—*

1. To reduce the beds so as to give, as nearly as may be, 1,200 cubic feet of space for each.
2. To ventilate all the wards by shafts and inlets for air, and also to reconstruct the fireplaces to admit fresh warm air in winter. Also to ventilate the kitchen by a shaft.
3. To provide a suitable water-closet, built out from the hospital, with access from passage. To convert the privy of the itch ward into a water-closet, and to reconstruct the privies in the back yard as water latrines.
4. Bath-room to be provided with a fixed bath, with hot and cold water, and suitable lavatory arrangements to be provided in the bath-room.

Lastly, each ward should be lit by a ventilating gas-burner. A room should be provided for the sick of soldiers' families.

## 7. FULWOOD BARRACKS, PRESTON.

These barracks are situated on high ground in the open country, about one mile and a half from the town of Preston. They cover an area of 27 acres, on a marly subsoil, with good means of natural drainage, but there is no outlet for the barrack drainage, except into a small stream passing through other peoples' properties. The river, which is the proper drainage outlet, is two miles and a quarter distant. The water supply is derived solely from wells, and the drainage is disposed of by being led into cesspits, from whence any overflow escapes into the small stream already mentioned.

The barracks are constructed to contain 1,142

non-commissioned officers and men, infantry, cavalry, and artillery, and were completed for occupation in the year 1848. The buildings are arranged in two squares, separated from each other by the officers' quarters and the hospital. The infantry barracks occupy two opposite sides of the first square next the entrance gate, and the guard-rooms, entrance gate, chapel school, and officers' quarters form the other two sides of this square.

The cavalry and artillery barracks occupy two sides of the other square.

The arrangement of the buildings is similar to that at Ashton and Bury, viz., the blocks occupied by the soldiers front the parade ground. Behind them, with a sufficient interval, are placed the cook-houses, cleaning sheds, &c. Behind these, with a further interval, the privies, urinals, and ash-pits, built against the boundary wall, and immediately outside the walls the large cesspits of the establishment.

The rooms run through the buildings, and have doors entering from either side of a passage or staircase; there are two rooms entering from each passage, and two rooms above entering from each staircase. The buildings have the great advantage of having only two flats of rooms, and only four rooms in each house. Each house has a passage right through it, a form of construction which greatly assists ventilation and convenience of access.

The following table shows the regulation accommodation, the actual occupation, and the available accommodation at 600 cubic feet per man of these barracks :—

| Barrack Rooms. | Total Regulation Accommodation. | Total actual Occupation. | Total Accommodation at 600 Cubic Feet per Man. | Total Deficiency of Regulation Accommodation at 600 Cubic Feet per Man. | Excess of present Occupation over available Accommodation at 600 Cubic Feet per Man. | Present Regulation Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|---|---|
| Infantry Square, West | | | | | | | |
| 14 | 224 | 252 | 168 | 56 | 84 | 16 | 12 |
| 14 | 210 | 238 | 168 | 42 | 70 | 15 | 12 |
| 2 | 20 | 24 | 18 | 2 | 6 | 10 | 9 |
| Cavalry Square, West | | | | | | | |
| 6 | 96 | 132 | 96 | — | 36 | 16 | 12 |
| 1 | 12 | 12 | 12 | — | — | 12 | 12 |
| Infantry Square, East | | | | | | | |
| 14 | 224 | 266 | 168 | 56 | 98 | 16 | 12 |
| 14 | 210 | 238 | 168 | 42 | 70 | 15 | 12 |
| 2 | 10 | 10 | 8 | 2 | 2 | 5 | 4 |
| Cavalry Square, East | | | | | | | |
| 6 | 96 | 132 | 96 | — | 36 | 16 | 16 |
| 2 | 12 | 12 | 10 | 2 | 2 | 6 | 5 |
| 75 | 1,114 | 1,316 | 912 | 202 | 404 | — | — |

This table shows that the infantry barracks have, according to existing regulation, 200 occupants more than they could contain at 600 cubic feet per man ; that the cavalry barracks are not overcrowded when occupied up to the regulation number ; that both cavalry and infantry barracks, at the time the return was made to us, had 404 men in them more than they could hold at 600 cubic feet per man, and that the then occupation exceeded the present regulation number by 202 men.

The total available accommodation, at 600 cubic feet per man, is sufficient for 912 men, and no more.

Two rooms only in the cavalry barracks have one man each, by regulation, more than they ought to contain, but these two men could be removed into other cavalry rooms, and this trifling redistribution of inmates is all that is required for the cavalry barracks ; the deficiency of regulation accommodation for 200 men therefore refers solely to the infantry barracks, every room of which contains more men, by existing regulation, than it ought.

The rooms are generally light ; they have one, two, four, and six windows each, according to their size. The rooms generally are deficient in ventilation, although some provision has been made for it. In the upper rooms there are circular openings in the ceiling, passing into the roof ; these are not sufficient for the renewal of the air in the rooms. These openings should have an area of not less than 12 square inches per man, and they should be connected horizontally by a shaft carried up through the roof, and 12 feet high.

There are circular openings in the ceilings of the lower rooms, which appear to communicate only with the space between the ceiling and the floor above ; these rooms should have shafts carried up to the roof, with an area of 11 square inches per man.

Inlets for air near the ceiling, between the windows of each room, with perforated zinc covers and regulating valves, are also required.

The grates are large, and waste a great deal of heat ; they might be remodelled with advantage, and made to warm the air admitted during winter.

There is no day-room nor drill shed for the men in these barracks.

There are four ablution-rooms situated in the ranges behind the barrack-rooms ; they have water laid on to 25 taps. There are no gratings for the men to stand on, and there are not sufficient pegs for the men to hang their things on while washing. Ventilation, by means of a louvre in the roof of each ablution-room, is required.

There are no baths. A proper bath-room, with a bath for every 100 men, would be a great improvement, but for this and for other purposes of health a larger water supply would be necessary.

There are two cook-houses next door to the ablution-rooms. The grates of the boilers might be advantageously reconstructed to save fuel and to cook more satisfactorily. The ventilation of the kitchen is not sufficient, and more ventilation through the roof by means of a louvre is required.

There are no means of roasting or baking meat in either of the kitchens. A roasting oven of sufficient size should be supplied to each.

There are two cleaning sheds in rear of the infantry barracks.

The women's wash-house in the barracks is good, but requires a drying stove.

The urinals are good, but are not supplied with water.

The privies have no drainage, except into cesspits, situated immediately outside the wall. They were most offensive, and require reconstruction as water latrines, with divisions and half-doors, and sufficient light.

The water supply is not sufficient at present to give water for flushing latrines or for other sanitary purposes. It is obtained from the roofs and from 14 pump wells. There are 10 ordinary supply tanks, and eight fire tanks. It is stated that if a well at the end of the barracks were deepened, a very much larger supply could be obtained. If this were done it would be necessary to put up a small steam engine to pump water ; or a windmill with a reservoir tank.

The town of Preston has a water supply, and it might be more economical to lay down pipes to bring it than to incur the constant cost of steam power and attendance.

Whenever a sufficient water supply is obtained, the privies should be improved as described, and flushed daily. But the flushing of the privies would render it necessary to obtain an outlet for the drainage, by applying it to grass land in the neighbourhood, or, in default of this, the removal of the cesspits to a sufficient distance from the barracks, and some arrangement for deodorization. In this case the overflow might pass into the present outlet for the surface drainage, and the solid part would have to be carted away. Probably, double filtration, first, through some porous material, and then through charcoal, would be the simplest plan for deodorizing the sewage.

The workshops are pretty good, but the tailors' shop requires an Arnott's silk flap ventilator, and an inlet for air.

The shoemakers' shop is used as a store.

There is gas in the barracks, but not in the barrack-rooms generally. The infantry serjeants' mess has gas. We are of opinion that a ventilated gas-burner should be introduced into each of the barrack-rooms.

The cavalry barrack-rooms are over the stables; they are similar in construction to those at Bury barracks.

The stables require ventilation, and to effect this, shafts should be carried up from the corners to above the roof, to prevent the effluvia entering the barrack-room, and perforated panes of glass should be placed in the stable windows.

The manure pit is too deep, and, by being so, the drainage from it is apt to saturate the subsoil.

All the ash-pits in the barracks are uncovered and undrained. It would be easy to dispense with them by an organized system of daily collection and removal of barrack refuse by iron carts.

There are 80 sets of married quarters attached to these barracks. They are in 10 houses of two flats, arranged in a single line. Each house has a passage and stair, going completely through from front to back, and giving access to eight rooms, four on each flat. Each room constitutes a married quarter. They are of good size. They have each a ventilator in the ceiling and one over the door. They are simple in arrangement, well constructed, and healthy, and with some alterations of detail, might be made the ground-work for model married quarters.

The rooms have each about 1,600 cubic feet of contents. Married quarters should never be of less cubic dimensions than this.

The grates have no oven for baking. An arrangement for warming the air in a fire-brick compartment behind the fireplace, previous to its being admitted into the room, would be very desirable in future buildings of the kind. An air shaft carried up in the chimney stalk, with a ventilator of perforated zinc over the door or window, would insure better ventilation.

There are cupboards in the rooms; pegs are required for hanging clothing on.

It might also be desirable to supply a small lock-up safe to each room, in the passage, or in some place where, being conspicuous, it must be kept clean.

The outbuildings, consisting of wash-house, laundry, &c. are placed behind the quarters, and between them and the main building is a spacious yard, where clothes are hung to dry.

The privies are defective, and should be converted into water latrines, with means for flushing.

The ash-pit was in a most objectionable condition, the smell from putrefying refuse thrown in being very offensive. The barrack refuse ought to be removed daily in an iron cart and the ash-pit abolished.

The wash-house is pretty good; but the drying room is not formed upon the best principle; it should be reconstructed, with a properly arranged stove and horses.

The chapel school requires inlets for air.

The light and ventilation of the guard-room are both defective, and would be much improved by the insertion of perforated slabs of glass into those of the loop-holes, now blocked up by brick. Slabs of glass inserted into the roof of the front verandah, above the windows, would also greatly improve the light.

*The following are the Sanitary Improvements required in these Barracks:—*

1. Reduction of numbers in the barrack-rooms to the extent pointed out.
2. Ventilation of all the barrack-rooms by shafts and inlets for air of the sections specified. The chapel school, guard-room, and tailors' shop to be ventilated as described.
3. The ablution-rooms to be provided with gratings for the men to stand on, and with additional pegs.
4. Bathing accommodation to be provided in the proportion of one bath to every 100 men.
5. A roasting oven of sufficient size to be provided for each of the cook-houses. Additional ventilation for the cook-houses to be provided.
6. Wash-house to be provided with a drying apparatus.
7. Increased water supply to be provided.
8. Sewerage and drainage to be improved, as pointed out, and all cesspits near the barracks to be abolished.
9. Privies in the barracks and married quarters to be reconstructed as water latrines, with divisions and half-doors, and light in the proportion of one and a half square foot of glass for every seat. Urinals to be supplied with water for cleansing.
10. Stables to be ventilated as described.
11. A service to be organized for collecting and removing the barrack refuse in iron carts, daily, and ash-pits to be discontinued.

It would be a great improvement to introduce a ventilated gas-burner into all the barrack-rooms; and day-rooms and drill sheds should be provided. It would also improve the married quarters to add an oven to each grate.

*Fulwood Barracks Hospital.*

The hospital of Fulwood barracks consists of two separate establishments, one for cavalry, the other for infantry. The whole building consists of 10 wards with 96 beds, and the offices for this small amount of accommodation are mostly in duplicate. The general construction of the building is defective; it is too complicated. The wards are most of them not sufficiently supplied with windows, and the means of natural ventilation are defective.

The following is the ward accommodation as compared with what it would be at 1,200 cubic feet of space per bed:—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| Cavalry, No. 1 | 8 | 5 | 3 |
| „ No. 2 | 8 | 5 | 3 |
| Infantry, No. 1 | 8 | 5 | 3 |
| „ No. 2 | 9 | 7 | 2 |
| „ No. 3 | 9 | 7 | 2 |
| „ No. 4 | 8 | 5 | 3 |
| „ No. 5 | 6 | 5 | 1 |
| „ No. 6 | 8 | 5 | 3 |
| „ No. 7 | 9 | 6 | 3 |
| „ No. 8 | 9 | 6 | 3 |
| „ No. 9 | 8 | 5 | 3 |
| „ No. 10 | 6 | 5 | 1 |
| Total - 12 | 96 | 66 | 30 |

In this table we have divided the cubic space in the wards, as near as may be, in the ratio of 1,200 cubic feet per bed, and it appears that the two divisions of the hospital contain space for no more than 66 beds.

Each ward has two circular openings in the ceiling for ventilation, but these are not sufficient; and we are of opinion that a shaft will have to be carried up from the ceiling of each ward to above the roof of the hospital, to give egress to the foul air, and that proper inlets for the air near the ceiling will have to be provided. The fire-grates might be readily altered to economize heat, and warm the inflowing air during winter, by having brick channels for the purpose introduced behind the fire.

There are gaslights in the passages, but none in the wards. It would, in our opinion, be advisable to introduce a ventilated gas-burner into each ward.

The arrangement of baths, lavatories, and water-closets, in this hospital, is in principle good. They are all placed in a detached building behind, but connected with the hospital by a corridor. The

water-closets are stated to be liable to get out of order. Otherwise the arrangements are sufficient.

The kitchens are also detached, and are sufficiently supplied with means of cooking. The kitchen on the cavalry side is complained of as being too small, but at the time of our inspection the cavalry hospital was occupied by infantry sick, for whom more kitchen accommodation was required.

The water supply, like that of the barracks generally, is derived from rain-water, and a well. It is forced up for the baths, &c. by means of a force pump.

The water-closets are drained into a cesspit. The same remarks apply to the hospital drainage, as have been made with respect to the drainage of the barracks.

There is no accommodation for the sick wives and children of soldiers, of whom 80 families live in the adjoining married quarters.

We have been struck, in examining the various regimental hospitals in different barracks, and in this one amongst others, with the great and unnecessary complication and want of simplicity, and consequent costliness of their structure.

The buildings are usually cut up in an excessive number of small wards; and in some instances there are apparently as many nooks and corners of one kind and another as there are patients.

It would, in our opinion, be most advisable to adopt some general principles of construction applicable to regimental hospitals, by which the first cost, as well as the subsequent expense of administration, may be reduced. We have hardly seen a single regimental hospital that may be pronounced as being in all points suitable for sick, and if there has been any exception to this rule, it has been where the building was not originally intended for a hospital.

Simplicity of structure, with abundance of light and natural ventilation by the windows, are those conditions which are required for the welfare of the sick, and for cheapness and efficiency of administration.

It would be difficult, at any cost, to render most of the present buildings suitable for sick. All that can be done with them, is to remove the defects that are positively injurious to health. But, while making what we conceive to be the recommendations necessary for this object, we would beg to suggest whether regimental hospitals on a better model might not be gradually constructed for all barracks where they may be required? The existing hospitals would not be lost to the country, for in almost all barracks there is accommodation of three kinds wanted; namely,—additional barrack accommodation, married quarters, and stores. For one or other of these objects, many of the existing hospitals might be appropriated, if suitable alterations were made in them.

*With regard to Fulwood Barrack Hospital, we would recommend:—*

1. Reduction of the numbers in each ward, so as to allow as near as may be, 1,200 cubic feet per bed.
2. Ventilation of all the wards in the manner pointed out.
3. Improving the drainage and water supply of the hospital along with those of the barracks.
4. A ventilated gas-burner should be introduced into each ward.
5. Accommodation for the sick of soldiers' families should be provided.
6. It would be advantageous to place a door in the passage leading to the water-closets, to prevent any effluvia from them from entering the hospital.

We have the honour to be, &c.

SIDNEY HERBERT.
JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

To the Secretary of State for War.
*Barrack and Hospital Improvement Commission, October* 15, 1858.

## YORKSHIRE DISTRICT.

SIR,

WE have the honour to transmit the following report on the barracks and hospitals at York, Leeds, and Bradford, together with the sanitary improvements required for each.

### 1. YORK CAVALRY BARRACKS.

These barracks are situated about a mile to the south of the city of York, in an open district, at a short distance from the left bank of the river Ouse. The ground within the boundary is a long parallelogram, projecting back from the public road. The buildings are arranged along the sides, and at one end of the enclosure. At the extremity opposite the entrance gates, are placed the officers' quarters, with the hospital on one side, and the riding school on the other. At right angles to these, and extending along the two sides, are two ranges of stables with barrack-rooms over them. The barrack offices, ash-pits, manure heaps, &c., are built against the boundary wall behind the ranges, and at a short distance from the men's windows. Nearer the gate on either side are the infirmary, stables, library, and reading-room, saddlers' and armourers' shops, canteen, fives court, tailors' and shoemakers' shops, forges, guard-room, and cells. The canteen is opposite the guard-room, and there are two entrance gates; but as the guard-room is situated at some distance from one of them, it has been suggested that it would be a great improvement to reconstruct it between the gates.

There is a spacious parade and exercising ground enclosed by the ranges of buildings. The parade ground near the officers' quarters appears to be in good condition, but the half of the ground nearest the entrance gate is imperfectly drained, and becomes wet and sloppy in rainy weather. The whole should be properly subsoil drained, which is the only means of remedying the defect.

The men's accommodation consists of 26 barrack-rooms and three attics, and there are 15 non-commissioned officers' rooms, affording accommodation by existing regulation for 336 non-commissioned officers and men, the particulars of which as regards the men's rooms are as follow:—

| Rooms. | Total Regulation Number of Men. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 26 | 208 | 208 | — |
| Attics:— | | | |
| 1 | 30 | 30 | — |
| 3 | 40 | 35 | 5 |
| 4 | 30 | 30 | — |
| | 308 | 303 | 5 |

The apparent deficiency of accommodation is only for five men at 600 cubic feet per man, but the actual number in barracks when the return was made to us slightly exceeded the regulation number. For instance, in attic No. 1, instead of 30 men, there were crowded together 11 men, 11 women, and 27 children, making 49 inmates in all, while in attic No. 4, there were 37 men instead of 30. The regulation space in the 26 barrack-rooms is about 555 cubic feet per man. If one man were removed from each barrack-room, the space for seven remaining men would be about 635 cubic feet per man.

Following our usual practice as regards barracks

in open situations, we do not in the present instance recommend any reduction in the inmates of these rooms, but in attic No. 3, five men should be removed, as well as every excess in any of the rooms over the regulation number, which ought on no account to be exceeded.

The arrangement of barrack-rooms is similar to those of most other cavalry barracks. A long corridor, 9 feet 6 inches high, runs from end to end of the range. In the present instance these corridors are reached by two stone staircases at equal distances from the ends of the ranges. In one range the corridor has a window at each end ; in the other range there is a window at one end, but the light and ventilation at the opposite end is cut off by the school-room, which extends across the end of the corridor. Both light and ventilation are deficient in these corridors, and will have to be improved by carrying up shafts from the ceiling through the attics to the roof. These shafts should be the square of the entire breadth of the corridor, and should be covered above with large ventilated skylights, and plastered inside. The end windows should have perforated glass panes put into them for ventilation.

The barrack-rooms open right and left out of the corridor ; they are all 28 feet long, by 16 feet 8 inches wide, and 9 feet 6 inches high. They have one large window to the outside, and one small window opening into the corridor. The door, as is usual in this class of rooms, opens close to the fire, and opposite the window, preventing the thorough ventilation of the room. We would recommend that an additional window be opened at the dark end of each barrack-room, and that the door be removed from its present position to the further end of the room.

None of the rooms have any efficient means of ventilation ; there are two openings in the ceiling communicating apparently with the outer wall, but they are of little use, as the plan is defective. We would recommend that all the existing openings be closed, and that a shaft be carried from one corner of each room to above the roof, and that each room have an inlet for air of the usual construction.

The fire-grates are of the old pattern, and should be remodelled to warm part of the air admitted during winter.

There are non-commissioned officers' rooms in each range : they are not sufficiently ventilated, and require silk flap ventilators in the chimneys.

The barrack-rooms are lighted with gas, and we are glad to state that an improvement has been introduced in ventilating the burners on the same principle recommended by us for other barracks.

The attics over the barrack-rooms are not equally good ; one of them is dark, and has no means of ventilation, and the roof is not lined, so that the interior is hot in summer, and cold in winter although heated by stoves. This attic has a few dormer windows on one side only. The other attic has been considerably improved by having dormer windows put into both sides, and by a partial ceiling through which there are ventilating openings into a space under the ridge, which again is ventilated by louvres. It was stated to us that similar improvements were about to be carried out in the other attic. We would, however, advise that in both cases additional light should be introduced by skylights in the darker parts of each attic. The roofs of the attics require lining and plastering.

The serjeants' mess is in the attic of one range ; part of it is partitioned off for a kitchen and living room for the mess servant. It requires ventilation through the roof.

At the time we inspected these barracks a strong ammoniacal odour pervaded the lower barrack-rooms immediately over the stables. This arose partly from defective ventilation in the stables, partly from their defective drainage, and partly from the want of litter sheds, and the litter being piled up under the men's windows.

The stable ventilation requires improvement by four shafts, one from each corner to be carried up through the roof, the shafts to have an aggregate area equal to 12 square inches per horse. The gratings over the stable doors should be removed, and a window substituted. The stables require proper draining. At the present time there are two cesspits outside each door, into which the whole drainage runs, and from whence it overflows into the gutters and creates nuisance. The stables should be suitably drained along with the barracks, and these cesspits removed ; litter sheds should also be erected at a sufficient distance from the stable doors.

There is a school-room at the end of one of the barrack ranges. It was originally a soldier's room, taken from the construction, and enlarged by throwing a partition with a window in it across the end of the corridor in such a way as to obstruct its ventilation. It would to very advisable to erect a suitable school-room, and be restore the present room to its original destination, but in the meantime a shaft and inlet, and a remodelled grate, should be provided for it as for the barrack-rooms.

There is a small detached cottage building, in which are two very small rooms, one of which is used as a library, and the other as a reading-room. The accommodation afforded is of the most limited character, and the reading-room should either be sufficiently enlarged, or another room built. The present rooms should be ventilated by a silk flap ventilator into the chimney, and glass louvres in the windows.

There are two ablution-rooms, one in each range, situated within the building, and at the foot of the staircase. They have slate tables and basins, with water laid on ; but the tables have no ledges ; there are no gratings nor pegs, and neither of the rooms is ventilated. These deficiencies should be supplied.

At the end of each ablution-room furthest from the outer wall, there is a small dark closet under the staircase. The closet contains a circular cast-iron tub, 4 feet in diameter, and 2 ft. 2 in. deep, occupying almost the entire area of the closet. This tub is used as a bath, and is supplied with water by a tap. The whole arrangement is exceedingly defective, and we should recommend the tubs to be removed, and a proper bath put up instead. The bath-room should be improved both in construction and lighting as far as practicable ; but the position is a bad one, and does not admit of much improvement. Something, however, might be done with it, but it would be much better to provide separate bathing accommodation.

There are two wash-houses, one behind each range. One of these houses has fixed tubs 4 feet long, and 2 feet broad, with cold water laid, and plugs for emptying. The tubs are divided from each other by partitions, and there are gratings for the women to stand on. It has two boilers, and is roomy, light, and well ventilated, but it has no means of drying or getting up linen, although there is sufficient space for a proper laundry and drying stove. The other wash-house is by no means so good. It requires fixed tubs, gratings, ventilation through the roof, and a proper drying stove. Each range has a cook-house at the foot of one of the staircases, in an apartment corresponding to the one occupied by the lavatory. Each cook-house is provided with boilers and an iron oven. The boilers are arranged along the wall, and have a species of cupola over them for carrying off the steam. The oven is imperfectly constructed, and is not sufficiently ventilated for roasting. This latter defect admits of remedy by enlarging the present openings in the door. Additional ventilation should be given to each cook-house by perforated glass panes in the upper window sashes.

There are four cleaning-rooms fitted with benches. There is no drill shed. There are four workshops for tailors, shoemakers, armourers, and saddlers.

The tailors' and shoemakers' shops are far too small, and barrack-rooms have to be misappropriated to find the requisite accommodation, when there is any extra

work to do. The present shops require ventilation through the roof.

There is a good and sufficient water supply, derived from the works of the York Water Company. There are besides seven pumps supplied by wells.

The whole drainage of the barrack requires improvement.

The present outlet appears not to have sufficient fall to drain the exercising ground. It is stated that a sufficient fall could be obtained by carrying the drain across the road to the river Ouse. At any rate the exercising ground should either be drained or raised.

All the barrack latrines require drainage. At the present time they empty into cesspits, the contents of which are periodically removed. They are close to the barrack ranges, and are in a noxious condition. There is an abundant water supply for converting the whole of them into water latrines, which should be done without delay. They should be drained to an outlet, and the cesspits abolished. When reconstructed, they should have divisions of seats, half-doors, light, and ventilation.

Adjoining the present privies are manure pits and ash-pits. Both are too close to the barrack-rooms, and should be removed to the end of the ranges, in which situation they should be raised a little above the surface, properly paved and drained, and their contents frequently removed. It would be much better, however, to provide for the daily removal of the whole barrack refuse.

The paving and guttering behind the stables are both defective, and foul water was lying on the surface under the windows of the barrack-rooms. The surface should be repaved with square setts, and the gutters properly laid.

There is a good riding-house, but it is too dark and not sufficiently ventilated. It requires skylights in the roof and louvres in the ridge. There is a tolerably good guard-house, but it is not sufficiently ventilated. It requires a shaft and inlet and a remodelled grate to warm part of the admitted air. This guard-room is almost the only one we have met with, in which sufficient cubic space is allowed for the men on guard. The amount allowed is 600 cubic feet per man. The cells open out of a passage at the back of the guard-room. They are warmed by a stove, but the passage is not sufficiently ventilated. Panes of perforated glass should be put into the passage window to remedy this defect. The canteen tap-room and the non-commissioned officers' room require silk flap ventilators into the chimneys, and perforated panes of glass in the windows.

Married quarters are much required in these barracks. There are none at present, excepting such accommodation as can be found in the men's rooms.

*The following are the Sanitary Improvements for these Barracks:—*

1. The small reduction of numbers in attic No. 3 as stated.

2. Ventilation and lighting the corridors by two shafts the square of the breadth of the corridor, carried up to the ridge, plastered inside, and covered above by ventilating skylights. Panes of perforated glass to be put into the corridor windows.

3. Each barrack-room to have an additional window at the dark end, and the door to be removed to the end of the room furthest from the fire. Each room to be ventilated by a shaft and inlet, and to have a remodelled grate. School-room to be ventilated by a shaft and inlet. Non-commissioned officers' rooms to be ventilated by silk flap ventilators.

4. Roofs of attics to be lined and plastered inside. The unimproved attic to have additional dormer windows, and ventilation through the roof. Both attics to have skylights to increase the light when required. Non-commissioned officers' mess-kitchen to be ventilated through the roof.

5. Stables to be ventilated by shafts as described, and to have windows placed over the doors.

6. Library and reading-room to be ventilated by silk flap ventilators, and a glass louvre in the upper window sash. Canteen tap-room and non-commissioned officers' room to be ventilated by a silk flap ventilator and perforated glass panes in the windows. Workshops to be ventilated through the roof. Riding school to have additional light and to be ventilated through the roof. Guard-room to be ventilated by a shaft and remodelled grate. Passage leading to the cells to be ventilated by panes of perforated glass.

7. Ablution-room to have ledges put to the tables, gratings and pegs supplied, and panes of perforated glass in the windows. Present baths to be removed. Bath-rooms to be improved, and two proper baths, with water laid on, put up in each.

8. Wash-houses to be provided with drying and laundry stoves. One of the wash-houses to have fixed tubs, with water laid on, gratings, and ventilation, similar to those in the improved wash-house.

9. Cook-houses to be ventilated by perforated panes in the windows. Additional ventilation to be given to the ovens to make them roast meat.

10. Barrack drainage to be improved, and a better outlet obtained if possible. Surface drainage to be improved by under-draining the exercising ground, and by better paving and guttering behind the stables. Cesspits to be abolished. Privies to be drained and reconstructed as water latrines, with divisions of seats, half-doors, light, and ventilation. Manure pits and ash-pits to be removed to a greater distance from the barrack-rooms, and to be properly constructed, paved, and drained, or the whole barrack refuse to be removed daily. Proper litter sheds to be provided.

*York Barrack Hospital.*

This hospital is a small square building situated in a corner of the barrack yard, close to the end of one of the stable ranges. It has no enclosure, no back yard, and no means for convalescents exercising.

It has a central passage and staircase, out of which on the ground floor are entered the surgery, kitchen, serjeants' room, and one small ward used at present as a store. On the floor above are three wards, and at one corner of the largest ward is a door leading into the upper flat of an outbuilding containing two very small badly lighted water-closets, with a narrow lobby out of which they enter. One of these closets is very defectively lighted. Underneath these closets, and entering from the open air, is a small store, in which there is a shower bath, and at a short distance are the hospital privies, placed like those of the barracks, over cesspits. The water-closets are drained into an open ditch in the adjoining field, and this ditch gives off noxious effluvia in certain states of the weather.

The hospital has regulation space for twenty-two beds, alloted among the wards as follows:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 - - | 4 | 2 | 2 |
| 2 - - | 4 | 2 | 2 |
| 3 - - | 4 | 2 | 2 |
| 4 - - - | 10 | 6 | 4 |
| Total - | 22 | 12 | 10 |

These wards will accommodate 12 beds, at as nearly as may be 1,200 cubic feet per bed. At the present time they have the appearance of being very much overcrowded; and the ward atmosphere was close and offensive, notwithstanding the provisions which have been made for ventilation. These consist in openings in the ceiling, covered with wooden slides, and ventilating tubes over the gas-burners. The means of renewing the air would be insufficient even were the numbers reduced in each ward, as

suggested above, and it is therefore necessary to increase the ventilation.

This we would recommend to be done as follows :—

Wards 1, 2, and 3 should each have a large silk flap ventilator introduced into the chimney, and an inlet for air close to the ceiling. The inlet to be covered within the ward by a cornice of perforated zinc for diffusing the air.

Ward No. 4 has two fire-places, one of which might be dispensed with, if the grate of the other were remodelled to heat part of the admitted air. We should propose to close up one of the fire-places, and to make an opening into its chimney flue close to the ceiling of the ward. This opening should have a sectional area double that of the flue, and it ought to be covered by a grating with large openings. Besides the foul air shaft this ward ought to have two inlets, one at each end, with cornices of perforated zinc, of the usual construction. All the other wards, as well as ward No. 4, require remodelled grates.

The dark water-closet should have light given to it by a window through the outer wall. This window should be capable of being opened for ventilation.

Additional ventilation should be given to the staircase by a shaft through the ceiling, and by perforated glass panes in the windows.

All the wards are lighted with gas, and the burners are ventilated by tubes with funnels into the chimneys. This great improvement should be introduced into all hospitals where gas is available.

There is neither lavatory nor fixed bathing accommodation in this hospital. A proper bath-room, with hot and cold water laid on, and an ablution table should be provided.

There is a good kitchen, provided with means of cooking, but it is under a sick ward, and should be ventilated by having a shaft 9 inches square carried up in one corner through the ward to above the roof. It should also have perforated glass panes in the windows.

Water is obtained from the town supply.

This hospital is small for the force in barracks, and its limited accommodation is further reduced by one of the wards being taken as a pack store. Additional space might be obtained in one of two ways, either by enlarging the entire building on a healthy plan, or by providing accommodation for the surgery, kitchen, and pack store in adjacent out-buildings, which might be so arranged as to obtain an enclosed space for convalescents.

There are three wards at present in use, and if this plan were carried out three additional wards would be obtained. Many small hospitals might have their ward accommodation similarly extended. The three wards in York hospital at present in use have space for 10 beds, while the force for which there is space in the barracks amounts to about 300 non-commissioned officers and men. The facts are sufficient to show that in one way or other more bed space should be obtained.

*The Sanitary Improvements required for the present Buildings are the follwing :—*

1. Reduction of regulation number of sick in each ward to the extent stated.

2. Ventilation of the three small wards by silk flap ventilators and inlets. Ventilation of the larger wards by converting one of the chimneys into a foul air shaft, and by two inlets for fresh air as described. Kitchen to have a shaft and perforated glass panes for ventilation. Staircase to be ventilated by a louvre through the roof, and by perforated panes in the windows.

3. Additional light to be given to the dark water-closet.

4. A bath-room, with a fixed bath, and hot and cold water laid on, and an ablution table to be provided.

5. Hospital to be drained to a proper outlet along with the barracks. The hospital privies to be drained and converted into a water latrine, and the cesspit to be abolished.

## 2. Leeds Barracks.

These barracks are situated to the north of Leeds, and at the outskirts of the town, in a comparatively open situation. They occupy elevated ground with a good fall for drainage. The officers' quarters are in one block, and the men's barracks are in two blocks, extending in a line along the highest side of the ground, which originally had a rapid slope to the front and at the eastern end. An esplanade has been formed in front of the barrack ranges, from the edge of which the ground sinks to the boundary wall, leaving only a narrow space, on which have been constructed infirmary, stables, orderly room, barrack offices, workshops, &c. On the slope at the eastern end of the barracks are the library, school-room, and riding school. Below these is the hospital, and a little below the hospital is the cavalry exercising ground. This ground is undrained, and is quite useless in wet weather or during winter, at which time it is often necessary to exercise the horses along the public roads. The ground might be drained and rendered sufficiently firm by underdraining at the depth of four feet below the surface, the drain tiles being laid from 10 to 15 feet apart. We are informed that both surface and subsoil drainage could be completed for about 300*l*.

The barracks have been built much too close to the boundary wall, and the dungheaps, privies, washhouses, cook-houses, &c. are close to the men's rooms, so close indeed that there is great nuisance experienced from them, especially during summer weather.

The barrack-rooms are built over the stables, and are reached by two spacious stone staircases in each range. At the top of each stair there is a lobby passing from front to back, lighted by two windows, and from the centre of these lobbies a long gloomy corridor runs from end to end of each range to give access to the soldiers' rooms, which open right and left out of it. This corridor is very imperfectly lighted by a window at each end, and by the cross light of the staircases and barrack-rooms ; and it has no sufficient means of ventilation.

To remedy this defect, and at the same time to increase the light, it will be necessary to carry up two square shafts the entire breadth of each corridor from its ceiling to the ridge, and to cover the top of the shafts by ventilated skylights. These two shafts should be carried up in the space between the staircases as nearly as possible at equal distances from each other, and from the stairs. Each of the windows of the corridors and staircases should have panes of perforated glass introduced for ventilation.

The men's barrack-rooms are 28 in number, and are all of a size, namely, 26 feet 9 inches long, 24 feet 2 inches wide, and 9 feet 10 inches high, and each is intended to contain 12 men with 529 cubic feet of space for each. The following table shows the total accommodation, with what it would be at 600 cubic feet per man :—

| Rooms. | Total Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 28 | 336 | 308 | 28 |

By removing one man out of each room a sufficiently close approximation to 600 cubic feet per man will be obtained.

The rooms have each one large window 9 feet wide, and 4 feet 6 inches high, in the middle of the outer wall, and this window, from being better placed than is usually the case with cavalry barrack windows, lights the room sufficiently. These windows open by sliding. There is another window opening from each barrack-room into the corridor intended to supply a certain amount of borrowed light to the latter.

The doors are close to the fire-places, as they generally are in similar barracks; this is an arrangement which makes the rooms cold, uncomfortable, and occasionally smoky. The arrangement answers no good purpose, and should be altered, and the door removed to the end of the room furthest from the fire-place.

Each room has three sliding ventilators in the ceiling, opening into the space under the roof. This plan of ventilation is ineffective, and should be done away with by carrying up a louvred shaft from the central opening to above the roof, and by providing an inlet for fresh air with a perforated zinc cornice close to the ceiling over the window.

The fire-grates are of a very inefficient and wasteful construction, and ought to be remodelled to warm part of the admitted air in winter. Besides the men's room, there are eight serjeants' rooms opening out of the corridors. These rooms require silk flap ventilators into the chimneys.

All the barrack-rooms are lighted with candles, although gas can be obtained. We would recommend a gas-burner to be introduced into each room, and if placed under the ventilating shafts we have advised for each room, it would not be necessary to provide any other means of carrying away the effluvia from the burners.

Foul air shafts are required for all the stables, to prevent the effluvia from passing into the men's rooms. One such shaft should be carried from each of the four corners of each stable to above the roof of the ranges. These four shafts should have an aggregate sectional area equal to 12 square inches per horse, and they should be carefully lined inside with perforated zinc to prevent the escape of effluvia into the rooms.

The paving and surface drainage of the stables and back yards are in a very defective condition. Foul water lies in the gutters. The sewer gratings are insufficiently trapped, and the stable litter is piled up against the walls directly under the men's windows.

These defects should be remedied by paving the stables outside as well as inside with square setts, by proper guttering, and by more careful trapping of the gratings. As already stated, part of the nuisance so much complained of arises no doubt from the narrowness of the stable yard, and the close proximity of dungheaps, latrines, &c. to the barrack-rooms. It would be most advisable to obtain ground to widen these yards, and this should be done with as little delay as possible. The narrowness of the space behind the stables is a cardinal defect in these barracks, but in the meantime much may be done to remedy the evil by removing the dungheaps and ash-pits, and by re-constructing the latrines. Proper litter sheds would have at the same time to be provided against the back boundary wall. These improvements ought to be carried out at once, but to do so it will be necessary either to provide for the daily removal of the whole barrack refuse by the contractor, or to find space for dungheaps and ash-pits at a sufficient distance, and barrows for conveying the manure to them.

There are four ablution houses built against the back boundary wall. They are very narrow, on account of the confined space in which they stand. They have the requisite conveniences for washing, but there are no pegs, and the houses are not ventilated. As the roofs are of corrugated iron perhaps the best method of ventilation would be to fill the top rows of all the windows with perforated glass panes.

There are no baths, but we have been informed that two have been authorized in this year's estimates. There should be four baths for the strength in barracks.

Each soldiers' range is provided with a cook-house supplied with boilers and iron ovens. The buildings are not sufficiently ventilated, and require louvres in the roof. These cook-houses are very narrow and confined for space, and occasion much inconvenience to the troops in their present state.

The whole barracks have an abundant and constant water supply from the Leeds Waterworks, for which great advantage 80*l.* a year are paid on contract.

Although the surface drainage of the cavalry exercising ground has yet to be carried out, the barracks themselves are drained into the town sewers, and the latrines have been recently connected with the drainage, and water is laid on for flushing them out. The arrangement is by no means a good one. The receptacles are too deep, and there was considerable nuisance from them at the time we were there. It would be much better to convert them into proper water latrines, in which water would always stand at a sufficient level to ensure cleanliness of the receptacles. The seats are partly divided by brick walls, to which we would recommend the addition of half-doors.

Much nuisance proceeds from the position and state of the urinals during warm weather, to remove which we would recommend their being supplied with water for cleansing.

The riding house is deficient both in light and ventilation, and ought to have skylights in the roof, and louvres along the ridge, to remedy these defects.

There is no proper laundry connected with these barracks, although there is a wash-house exhibiting the usual deficiencies. It requires fixed tubs, with water laid on, ventilation through the roof, and a proper drying stove.

There are two school-rooms, one for adults and the other for infants; the latter was once a stable, and is at present used as a store. Complaint is made that the place is damp, on account, apparently, of want of means of renewing the air within. The room is large, and not well lighted, as it has windows only at one end. It ought to have two ventilating shafts carried up from the corners opposite the door, and two inlets over the windows. A stove is used for warming the room, to obtain the full effect of which it would be necessary to admit air under the floor to enter the room round the stove.

The adult school-room should have additional ventilation by inlets of the usual construction; it has openings in the ceiling to act as outlets. The serjeants' mess requires ventilation by a shaft and inlet, as does also the library. The latter should have a remodelled grate to warm part of the admitted air in winter.

There are the following deficiencies in the accommodation of these barracks:—There are no day-rooms, cleaning-rooms, nor married soldiers' quarters.

There is one workshop each for armourers, shoemakers, tailors, and saddlers. There are two forges and a shoeing shed. The shoemaker's, tailor's, and saddler's shops require ventilation by shafts and inlets.

The canteen tap-room and non-commissioned officers' room require silk flap ventilators into the chimney, and perforated panes of glass in the windows for ventilation.

Additional ventilation should be given to the guard-room by a shaft and inlet, and by a remodelled grate. Perforated panes should be introduced into the passage window leading to the cells.

The adjoining defaulters' room has openings in the ceiling for ventilation, but the plan is not a good one. The central opening should be converted into a shaft carried above the ridge.

*The following is a Summary of the Sanitary Improvements required for Leeds Cavalry Barracks:—*

1. Reduction of the numbers of men in each room to the extent stated.

2. Ventilating and lighting the corridors by shafts with skylights, as described, and by perforated glass panes in the corridors and stair windows.

3. Ventilating the men's rooms by shafts and inlets, and by remodelled grates. Removing the doors of the men's rooms from their present position to the other end of the room; ventilating the non-commissioned officers' rooms by silk flap ventilators.

4. Introducing gas into all the barrack-rooms, school-rooms, library, &c.

5. Ventilating the stables by shafts carried up from the corners to above the roof; improving the paving and drainage of the stables.

6. Ventilating the workshops, serjeants' mess, school-rooms, defaulters' room, guard-room, and library by shafts and inlets, as described; the library and guard-room to have remodelled grates; infant school-room to have air introduced round the stove. Ventilating the canteen tap-room and non-commissioned officers' room by silk flap ventilators and perforated glass panes. Ventilating and lighting the riding-house by louvres along the ridge and by skylights.

7. Yards behind the stable ranges to be repaved with square setts, properly guttered, and the drains trapped. Ash-pits and manure heaps to be removed; litter sheds to be constructed against the back boundary walls; yards to be widened by obtaining additional ground, if possible.

8. Ablution houses to be supplied with pegs, and to have perforated glass panes in the upper row of each window. Four baths with water laid on to be provided.

9. Present cook-houses to be ventilated by louvres, or to be reconstructed, widened, and ventilated.

10. Cavalry exercising ground to be under drained.

11. Latrines to have receptacles in which water will stand, and to have half-doors. Urinals to be improved and supplied with water.

12. Women's wash-house to have fixed tubs and water laid on, a drying stove, and ventilation through the roof.

### *Leeds Barrack Hospital.*

This hospital is situated near the foot of the slope at the eastern end of the barrack ranges, and close to the cavalry exercising ground. It is only one story high, and consists of two wings, with one ward in each, connected by a centre, which consists of a corridor behind, and of two small wards in front. A verandah has been carried along the centre on the south side. The entrance is in the middle of the length of the centre. It passes through and through the building, and is connected with the kitchen, wash-house, bath-room, &c. by a covered verandah.

These offices are built at right angles to the line of the hospital and are in the yard behind. The situation of the buildings is a very bad one, and their general structure and arrangement are ill adapted for the purposes of a hospital.

The adjoining cavalry exercising ground, which is some three or four acres in extent, becomes a complete swamp after wet weather, and it is some time before the moisture dries up. Two of the hospital wards are dark and gloomy, and the bath-room has to be reached by walking in the open air across an undrained court. As a whole, the building does not admit of much improvement, and the best thing which could be done would be to erect another hospital, and turn the present building to some more suitable purpose. We shall therefore confine our recommendations to the most necessary points.

The building had originally six wards for sick. Two of these wards have, however, been taken from the construction for the surgery and orderlies' room. The remaining four wards have regulation accommodation for 25 beds, arranged as follows:—

| Wards. | Regulation Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 - - | 10 | 6 | 4 |
| 2 - - | 2 | 1 | 1 |
| 3 - - | 3 | 1 | 2 |
| 6 - - | 10 | 6 | 4 |
| Total - | 25 | 14 | 11 |

The two larger wards have four windows each, and are sufficiently lighted. The two smaller wards have each one window, and are gloomy. They should accommodate no more than one bed each, while the two large wards might have six beds each, although the cubic space would be somewhat under 1,200 cubic feet per bed.

The building certainly should not have more than 14 beds in the present wards. Each of the larger wards has six openings through the ceiling to the space under the roof for ventilation. This arrangement is not sufficient, and we are of opinion that a louvred shaft should be carried up above the ridge over the middle of each ward. Two inlets for air should also be provided close to the ceiling, one at the side and one at the end of each ward. These inlets should be of the usual construction. The two smaller wards are not ventilated, and we should propose that each should have a silk flap ventilator into the chimney, and a Sherringham's ventilator above the window.

Each of the larger wards has an old pattern grate, which wastes much fuel. We would recommend their being replaced by remodelled grates constructed to warm part of the admitted air.

A few panes of perforated glass should be put into the upper row of the corridor windows. The wards are lighted by candles, although there is gas within the building. A ventilated gas burner should be introduced into each ward.

Behind the kitchen, and entering from the back yard, is a room in which the sick wash, but it has no proper means of ablution. There is a shower bath in it, and two slipper baths. In its present state this room is unsuitable for its purpose. The bath and ablution room should be much nearer the hospital, or at all events should be connected with it by a covered communication. The present room should, therefore, either be changed for another, or it should be made accessible under cover.

A fixed bath, with hot and cold water laid on, should be constructed, and a proper ablution table, with sunk basins and water laid on, should be provided.

There is no laundry for getting up hospital linen.

The kitchen appears to be sufficiently supplied with the requisites for cooking.

Water is derived partly from a spring, and partly from the Leeds Waterworks, but the water is not properly laid on to the building. It is raised from tanks by pumping, while it could be laid on at pressure.

The hospital sewerage is in a very defective state. An open gutter descends the slope from the stables above, and empties itself into a drain immediately in front of the hospital. The smell from this gutter and drain are said to be very offensive in summer.

The water-closet and other drainage from the hospital is discharged into a cesspit about 200 yards distant, which is emptied periodically.

There are two water-closets in a small building carried out behind the corridor. They are supplied with self-acting pans, but they should be properly drained, and the cesspits abolished. The whole hospital drainage should, in fact, be improved along with that of the barrack, and the offensive gutter and drain in front done away with.

*The Sanitary Improvements we would recommend for this Hospital are as follow:—*

1. Reduction of the number of beds in the wards to the extent stated.

2. Ventilation of the wards by shafts and inlets as described, and perforated glass panes to be inserted in the corridor windows. Remodelled grates to be put into the two larger wards.

3. Lavatory and bath-room to be re-arranged, and to have a covered communication with the hospital. A proper ablution table and a fixed bath, with hot and cold water laid on, to be provided.

4. Gas burners to be introduced into the wards.

5. The hospital drainage to be conducted to an outlet, and the cesspit abolished. The offensive gutter and drain in front of the hospital to be done away with.

6. Drainage of the exercising ground has been already recommended, but disallowed. Its proximity to the hospital affords an urgent reason for the improvement being carried out if the hospital is to be left where it is.

### 3. Bradford Moor Infantry Barracks.

These barracks are situated about a mile from the town of Bradford, on the top of Bradford Moor, on a high, airy, healthy position, within an enclosure $7\frac{1}{2}$ acres in extent. They consist of a number of buildings of different dates, the older parts of which were originally a farmhouse and cottages, converted into barrack-rooms, stores, hospital, &c.; while the newer buildings were erected in the years 1851–52. There are houses outside the boundary, but the site is essentially in the country. The river Aire passes within $1\frac{1}{4}$ miles of the barracks. The subsoil is rocky, and the means of natural drainage sufficient. The buildings are mostly of stone and a small part of brick; they vary considerably in character. The newer buildings run parallel with the boundary wall, in which is the entrance gate. The older buildings are close to one of the boundary walls, and run at right angles to those already mentioned. The old and new buildings thus bound two sides of the parade ground; while a third side is bounded by four detached brick huts of recent construction. The newer buildings and huts are alone at present occupied as soldiers' quarters. The old cottages are used for married soldiers, workshops, the canteen, stores, stables, &c. The whole of these cottage structures are hardly fit for occupation. We have been informed that they have been long condemned, and unquestionably the best and most economical course to take would be to sweep them all away, and to replace them by more suitable structures.

The men's new barrack-rooms are in two blocks, which differ somewhat in structure. They are each two stories high, and are divided by staircases into separate houses, having four rooms to a house. The rooms run from front to back of the blocks, and have two windows on two sides. In one of the blocks the passages and staircases have been boxed off from the men's rooms, reducing the cubic contents of the rooms, and depriving the rooms of one of the windows. In the other block the passages and staircases are carried through and through the building, which is a far better construction both for light and ventilation.

Between these blocks and the boundary wall, at the distance of a few yards from the windows, are a range of old offices, ash-pits, urinals, &c., which are quite unnecessary in such a position. These in our opinion should be cleared away, and as the space is rather narrow, we should propose to place on it only the more necessary buildings at present required to complete the barrack arrangements. The total regulation accommodation in the new buildings is for 183 non-commissioned officers and men, the details of which are given in the following table :—

| Rooms. | Regulation Number of Men. | Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Proposed Number of Men per Room. |
|---|---|---|---|---|---|
| 14 - - | 168 | 140 | 28 | 12 | 10 |
| 2 - - | 12 | 10 | 2 | 6 | 5 |
| Total - | 180 | 150 | 30 | — | — |

To give rather less than 600 cubic feet per man it will be necessary to restrict the occupants in each of the fourteen 12-men rooms in the table to ten men per room, and to restrict those in the two 6-men rooms to five men per room.

None of the rooms are ventilated. They each require a shaft to be carried from the ceiling to above the roof, and two inlets for air, with perforated zinc cornices, one on each side between the windows and close to the ceiling. There are two or three small rooms in one of the blocks, one of which is used as an infant school. These rooms should have a silk flap ventilator into the chimney. All the staircase and passage windows in the two new blocks should have perforated glass panes in the upper sashes for ventilation.

The rooms are warmed by the old pattern grate. Grates remodelled to warm part of the admitted air in winter should be provided.

The huts have porches and a ceiling through which there are openings for ventilation, but they are not sufficient. We would propose to carry a shaft from the centre of the ceiling directly through the roof, and to leave two of the existing openings in the ceiling for inlets, provided a piece of open wire gauze or perforated zinc be put over them. Each hut has regulation space for 19 men at 310 cubic feet per man. With this number the huts are overcrowded, and we would propose to reduce the regulation number to 16 men per hut, which will raise the cubic space to that allotted at Shorncliffe camp. The grates in these huts should also be remodelled.

The barrack-rooms are lighted by candles. Gas should be introduced instead, when it can be obtained.

There are two lavatories, one belonging to the hut barracks, the other is a mere lean-to shed behind the barrack blocks. The former of these has washing benches and basins, but no gratings or pegs, and it has no ventilation. These deficiencies should be supplied, the last by a louvre in the roof. The washing shed behind the blocks is quite unsuitable for its purpose. It ought to be removed entirely, and a proper ablution-room, with benches, basins, water laid on gratings, pegs, light, and ventilation, should be constructed along the boundary wall in a position as convenient as possible for the barrack-rooms. There are no baths at present. Two baths, with water laid on, should be provided in connexion with the new ablution-room.

The women's wash-house is a low dark room in the oldest part of the buildings. It is destitute of the necessary conveniences, and not fit for its purpose, and it would be of little use to spend money in improving it. A new wash-house should be built, with fixed tubs, boilers, water laid on, a drying stove, &c.

A certain amount of very defective accommodation for married soldiers is afforded in attics formerly used as barrack-rooms over stables. The buildings altogether are in so dilapidated a condition that they hardly admit of being improved.

There are two cook-houses; one for the barrack blocks, the other intended for the huts. The former has six boilers and two iron ovens; the latter has two boilers and one oven: it requires ventilation through the roof.

A room in the old farm-house answers the purpose of a library. It is unventilated, and requires a silk flap ventilator into the chimney.

The tailors' and shoemakers' shops are in the old cottage buildings, and are scarcely fit for occupation. Better accommodation for trades is absolutely required.

There is no day-room nor covered drill shed, and the canteen is a very defective building; in short we must repeat that, with the exception of the new barrack blocks, the huts, and the newly-built offices connected with them, there are no buildings within the boundary fit for occupation as soldiers' quarters.

A great defect in these barracks is the present

condition of the water supply. There are two pump wells, and the roof-water is collected in two tanks for use. It is stated that there is an abundant and excellent supply of water within a mile of the barrack, but at the present time an artesian well is being sunk within the barrack boundary. It was about 100 yards deep at the time the return was made to us, and is not yet finished.

At one corner of the enclosure there are newly constructed latrines, which are drained into a cesspit outside the boundary ; they are in a very defective state from want of water, and as soon as a proper water supply is obtained they should be converted into water latrines on Macfarlane's principle, which would remove all nuisance with a minimum expenditure of water. The urinals should also be supplied with water. Close to the latrines is a new ash-pit, which may be used with safety, but all the old ash-pits should be abolished forthwith as already recommended. Notwithstanding the elevated position of the buildings, the parade ground is in a bad condition for want of drainage ; it should be under drained.

The guard-room has no ventilation ; it requires a shaft and inlet, and a remodelled grate. The window in the passage leading to the cells should have panes of perforated glass in the windows.

*The Sanitary Improvements required for Bradford Moor Barracks are as follow :—*

1. Reduction of the inmates in the barrack-rooms and huts to the extent stated, and the evacuation of the old buildings.

2. Ventilation and warming of the barrack-rooms, and huts by shafts, inlets, and remodelled grates. Passages and staircases to be ventilated by perforated glass panes in the windows. Small rooms and infant school-room in the barrack blocks, and the library, to be ventilated by silk flap ventilators. Guard-room to be ventilated by a shaft, inlet, and remodelled grates.

Passage leading to cells to be ventilated by perforated panes.

3. A new ablution house, with two baths, to be provided for the barrack blocks. Ablution house behind the huts to have gratings, pegs, and ventilation through the roof.

4. Parade ground to be drained ; water supply to be improved.

5. Latrines to be reconstructed, with receptacles to hold water and proper divisions, half-doors, and ventiation. Urinals to be supplied with water.

6. The new ash-pit to be filled up to the level of the ground, paved and drained. The old ash-pits and manure pits behind the barrack blocks to be abolished.

*Bradford Moor Barrack Hospital.*

This hospital consists of three small cottages, which were originally purchased with the ground, four of the top rooms of which have been converted into sick wards. The accommodation is so miserably deficient that it is unfit for the sick ; it is in fact just such a place as in civil life sick poor are removed from to be sent to hospital. The following is the accommodation :—

| Wards. | Present Number of Beds. | Number at 1,200 Cubic Feet per Bed. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 - - | 4 | 2 | 2 |
| 2 - - | 4 | 2 | 2 |
| 3 - - | 4 | 1 | 3 |
| 4 - - | 4 | 1 | 3 |
| Total - | 16 | 6 | 10 |

The place has no lavatory, bath, laundry, provision, or bedding store. It has no water-closet, but only two very offensive privies at one end.

We would recommend its abandonment as soon as possible, and the construction of a suitable hospital adapted to the size of the barrack. To diminish the risk incurred by the current sick in such a building, *we should recommend as follows :—*

1. The immediate reduction of the number of sick in the wards to the extent stated.

2. Providing each ward with a silk flap ventilator into the chimney, and a Sherringham's ventilator for an inlet.

Sidney Herbert.
John Sutherland.
W. H. Burrell.
Douglas Galton.

To the Secretary of State for War.

*Barrack and Hospital Improvement Commission, June* 3, 1859.

## NORTHERN DISTRICT.

Sir,

Having inspected and made inquiry into the sanitary condition of the barracks and hospitals at Newcastle-on-Tyne, Sunderland, Tynemouth, and Carlisle, in the Northern District, we have the honour to report the result as follows :—

### 1.—NEWCASTLE BARRACKS.

These barracks are situated in an airy, open position on Newcastle Moor, to the north of the town and at its outskirts. They stand within an area of 10a. 3r. 2p., but although the amount of ground is amply sufficient for every purpose of such a barrack, the stables and barrack-rooms are built too close to the boundary wall, and as a result of this the dung-heaps, ash-pits, and latrines are brought much too close to the men's rooms, and give rise to nuisance.

The narrow yard between them and the barrack-rooms is paved with boulders, which renders both cleansing and surface drainage difficult. This form of paving should be gradually removed, and proper square setts laid down both in the stables and along the ground outside back and front.

The buildings are of brick, and were constructed about the year 1804. The subsoil on which they stand is clay. The fall of the ground is amply sufficient for every purpose of good drainage, and there is an outlet close at hand into the town sewers.

The barrack-rooms are in two blocks in line, separated by an entrance in the centre, and there is a third block, containing three large arched rooms within a separate enclosure, a little below the middle of the parade ground, in a building which was formerly the powder magazine. The first two blocks, K. and B., are two stories in height. The lower story in both blocks is occupied by stables and ablution-rooms, over which are the men's rooms, reached by long, steep, and narrow wooden stairs, with the rooms opening right and left at the top. At right angles to these blocks, at one end, and separated from them by a short distance, is a large block of officers' quarters, behind which are barrack offices, &c., and behind these is the canteen. The hospitals are at the lower end of the enclosure.

The barrack is intended for occupation by either cavalry or infantry, or both, and contains 26 men's rooms and 14 non-commissioned officers' rooms, with regulation space for 476 non-commissioned officers

and men. The following table shows the accommodation in the men's rooms :—

| Rooms. | Present Regulation Accommodation in Men. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| K. Range. | | | |
| 1 - - | 14 | 12 | 2 |
| 2 - - | 14 | 12 | 2 |
| 3 - - | 14 | 14 | — |
| 4 - - | 14 | 12 | 2 |
| 5 - - | 14 | 14 | — |
| 6 - - | 14 | 14 | — |
| 7 - - | 14 | 14 | — |
| 8 - - | 14 | 12 | 2 |
| 9 - - | 14 | 14 | — |
| 10 - - | 14 | 14 | — |
| 11 - - | 14 | 14 | — |
| 12 - - | 14 | 12 | 2 |
| 13 - - | 14 | 14 | — |
| 15 - - | 14 | 14 | — |
| 16 - - | 14 | 12 | 2 |
| B. Range. | | | |
| 1 - - | 24 | 14 | 10 |
| 2 - - | 24 | 14 | 10 |
| 3 - - | 24 | 14 | 10 |
| 4 - - | 24 | 14 | 10 |
| 5 - - | 24 | 14 | 10 |
| 6 - - | 24 | 15 | 9 |
| 7 - - | 24 | 14 | 10 |
| 8 - - | 24 | 14 | 10 |
| M. Range. | | | |
| 1 - - | 20 | 20 | — |
| 2 - - | 20 | 20 | — |
| 3 - - | 20 | 20 | — |
| Total - | 462 | 371 | 91 |

The rooms in K range are not much over-crowded, and will hold within 12 of the present regulation number at rather less than 600 cubic feet per man. The rooms in B range are excessively over-crowded. The rooms in M range would, so far as concerns cubic space, hold more than their present number of occupants, but the space is all above the beds, because the magazine consisted of long, lofty, narrow, arched vaults. At present the distance between the beds every way is not more than a foot, so that in reality these rooms are over-crowded with 731 cubic feet per bed.

All the rooms have some provision for ventilation, but it is of such a nature as to render further ventilation necessary. In range K the rooms are back to back, with a number of openings between them, the only result of which is the intermingling of the foul atmosphere of the different rooms. They have also gratings communicating with the open air. In range B the rooms run through and through, and have windows on both sides, but they are of considerable breadth in proportion to their height.

It is essentially necessary that each barrack-room be ventilated by itself, and to effect this we would recommend that in each barrack-room in K range a louvre be carried from the ceiling through the roof, close to the division wall, forming the back of each room, to act as an outlet. Two inlets for air, close to the eaves, would also have to be provided. In range B two louvred shafts should be carried from the centre line of the ceiling to above the roof, and inlets should be provided close to the eaves, one inlet to be on each of the opposite sides of the room. The rooms should have remodelled grates to warm part of the air admitted in winter ; and when these ventilating arrangements are completed, all the other ventilating openings, whether between adjacent rooms or to the open air, should be closed. The 24 men's rooms in B range are only 8 feet high, a height quite disproportionate to their other dimensions. They are in fact 4 feet lower than the rooms in K range, and 9 feet lower than those in M range, which latter, however, are disproportionately high. It would be most advisable to raise the ceilings of B range to obtain sufficient height for the rooms, which they certainly have not at present, and the want of which is the reason why these rooms are so overcrowded by their present inmates.

The rooms in M range should have more light by enlarging the windows, and they should have two shafts carried up through the soffit of the arch, one at each end, and the fire-grates should be remodelled to warm part of the admitted air in winter.

In B range there are a number of serjeants' rooms at the top of the staircases which require silk flap ventilators into the chimneys. Each of the staircase windows should have panes of perforated glass in the upper rows, to improve the ventilation.

The rooms are lighted by candles, although gas is obtainable. We would advise one or more gas burners to be introduced into each barrack-room. The burners should have funnels and tubes for ventilation, and the end of the tubes should be turned up into the outlet ventilating shafts. In the rooms where the burners can be placed directly under the shafts, no tubes are necessary.

A library which occupies a barrack-room in B range requires ventilation by shafts, inlets, and a remodelled grate, like other barrack-rooms. Gas should also be introduced into it.

There is a large and excellent chapel school, but it is deficient in ventilation. It requires openings in the ridge, and air to be admitted under the floor to enter round the stoves, so as to be warmed in winter. Generally the rooms have too little window space.

There are 15 serjeants' rooms, besides as many serjeants' berths, taken off the barrack-rooms. Each room requires ventilation by a silk flap ventilator in the chimney.

There is no serjeants' mess, but a portion of a building occasionally used as a hospital, though eminently unfit for sick, is occasionally used as a non-commissioned officers' mess room.

There is a small infant school, which requires a remodelled grate. The schoolmistress's quarters require a window in the back wall for ventilation.

The stables are lofty and spacious, but they are not sufficiently ventilated, and precautions are required for preventing the effluvia passing upwards into the men's rooms above.

A shaft should be carried from the ceiling at each corner of each stable to above the roof, and the shafts should have a conjoint area of 12 square inches per horse.

There are three ablution-rooms, with space for 134 men at a time. One is a stable under K range, another similar room is under B range, and there is a smaller one adjacent to M range. All of these ablution houses require beads to the tables to keep the water from splashing over on the men while washing. They also require gratings, pegs, and forms. The ablution-rooms under K and B houses require two ventilating shafts carried from the ceiling above the roof of the ranges. The ablution shed at M range requires a skylight, and ventilation through the roof.

There are no baths. Five baths, with water laid on, are required, and there is ample space for them in the present ablution-rooms.

Each of the three ranges has a women's wash-house, all of which are defective in several important particulars. They all require roof ventilation, fixed tubs, with water laid on, gratings to stand on, and drying and laundry stoves.

There are two cook-houses, with old-pattern boilers and steam tubes. Recently, ovens have been put up of a model common in Newcastle. The consumption of coal in these cook-houses is very large, when com-

pared with that in the improved cooking ranges at Woolwich and in the Wellington Barracks.

Newcastle barracks are abundantly supplied with water from the town water mains, wells, tanks, &c.

As already stated, the drainage outlet is into the town sewers. Into these sewers the latrines are flushed, and they are so constructed that about six inches of water stand in them. This, however, is not sufficient to prevent nuisance from them being experienced in the barrack-rooms, and, besides, they are otherwise in a very defective state, and will require reconstruction, with proper water receptacles, divisions, half-doors, light, and ventilation.

Adjoining the latrines, which are built against the boundary wall fronting the public road, are the ashpits and manure heaps. They are much too close to the men's rooms, and ought to be removed from their present position altogether, to a safe distance beyond the end of the ranges. The space now occupied by them might be advantageously used for erecting litter sheds, of which there are none at present. The manure receptacles and ashpits should, when reconstructed, be raised above the surface and drained, and arrangements should be made for the frequent removal of all barrack refuse. The urinals should be reconstructed near the latrines. They should have proper divisions and should be supplied with water.

There are two guard-rooms ; one of these, the main guard, has no ventilation, but there are openings through the wall into the roof over the adjacent provost cells, which are, hence, really ventilated into the guard-room, especially when the guard-room fire is lighted, and the door closed. These openings should be built up, and a shaft, two inlets from the open air, and a remodelled grate should be provided for the guard room.

The provost cells are entered through the serjeants' room, which is dark, and requires more light, and ventilation by a silk flap ventilator into the chimney. The ventilation of the cells passes into the roof, but in order to render it efficient there should be a louvred opening in the ridge above.

There is no lock-up, except an apartment in one of the barrack ranges under a soldiers' room. It is not well adapted for its purpose.

Opposite the main guard-room is a picket guard-room, which requires ventilation by a shaft and remodelled grate.

The canteen tap-rooms require [silk] flap ventilators in the chimneys, and perforated panes in the windows.

These barracks have no day-room. They have no accommodation for married soldiers whose wives are allowed in barracks ; and they have no shoemakers' shop. There are wheelers', armourers', saddlers', and tailors' shops. These all require ventilation by inlets, shafts, or silk flap ventilators where there are fireplaces.

There is no special covered drill shed, but a spare shed, 70 feet long by 30 feet wide, and 17 feet high, is sometimes used for the purpose.

Cleaning is done in two narrow passages under K range, but there are no special cleaning sheds.

*The following is a Summary of the Sanitary Improvements required for Newcastle Barracks :—*

1. Reduction of overcrowding in each room to the extent stated in the table.

2. Ventilation of each barrack-room by shafts, inlets, and remodelled grates ; ventilation of the non-commissioned officers' rooms by silk-flap ventilators in the chimneys ; ventilation of the stables by shafts from the corners of the ceiling carried up through the roof ; ventilation of the library, chapel, school, and infant school as described ; ventilation of the guard-rooms by shafts, inlets, and remodelled grates ; ventilation of the provost cells and serjeants' quarters ; ventilation of the canteen tap-rooms by silk-flap ventilators ; ventilation of the workshops as described ; ventilation of the barrack-room staircases by perforated panes.

3. Ablution-rooms under ranges K. and B. to have ventilating shafts carried up from the corners to above the roofs. All the ablution houses to have beads to the tables, gratings, pegs, and forms. Five baths, with water laid on, to be provided.

4. Women's wash-houses to have roof ventilation, fixed tubs with water laid on, gratings, and drying and laundry stoves.

5. Privies to be reconstructed as water latrines, with divisions, half-doors, light, and ventilation. Urinals to be properly reconstructed and supplied with water.

6. Manure heaps and ash-pits to be removed from their present position, and reconstructed at safe distances from the barracks, with proper paving and drainage, to be raised above the level of the ground, and arrangements made for conveying away the whole refuse daily.

7. Litter sheds to be constructed on the site of the present manure heaps and ashpits.

This barrack, as a whole, is by no means in good condition, and owes to its exposed position, and not to its structure or sanitary arrangements, any measure of health the troops may enjoy in it.

### *Newcastle Barrack Hospitals.*

There are two buildings appropriated as hospitals for these barracks. They are both situated on the lower side of the parade ground, and the surface drainage from the slopes above gravitates towards them.

One of the hospitals is intended for cavalry sick, the other for infantry. The former has been built for a hospital, the latter was originally a gun-shed. Neither of them has any enclosure in front, and they open directly on the parade ground.

*The Cavalry Hospital* is two stories high. It has a central entrance, passage, and staircase which runs from front to back, and out of this passage a corridor branches right and left, giving access to a small ward at each end of the building, and to a surgery and serjeants' room. Above these are four small wards. The end wards have two windows, one on each end ; the other wards and apartments have one window each. The kitchen is detached in the yard behind, and adjoining it are the privies, ashpits, wash-house, and dead-house.

There are in all six wards and 26 beds. The particulars of the accommodation are as follow :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 5 | 3 | 2 |
| 2 | 5 | 3 | 2 |
| 3 | 5 | 3 | 2 |
| 4 | 3 | 1 | 2 |
| 5 | 3 | 1 | 2 |
| 6 | 5 | 3 | 2 |
| Total - | 26 | 14 | 12 |

By allowing rather less than 1,200 cubic feet per bed in the four largest wards, and allotting one bed each to wards 4 and 5, which is all they ought to contain, there is space for 14 beds in this building. Two beds ought to be taken off the construction of each ward.

A certain provision for ventilation has been made in this building, but it is not effectual, although it can be rendered so. A shaft has recently been carried up from the ceiling of each ward, but, instead of passing directly through the roof to the open air, it terminates under the roof. This arrangement errs against the first principles of ventilation of hospitals and barracks, which require that each ward and room should have a direct and separate communication with the external

air. Each of these shafts, therefore, must be carried up above the roof, and terminated in a separate louvre.

Another error of application has been that of furnishing each shaft at its lower end with a flat sliding cover. This cover was shut in several instances when we were there, and it must be removed from all the shafts to prevent this being done in future.

Glass louvres have been introduced into the windows for admitting air, but they are not sufficient and proper inlets; two for each end ward and one for each of the other wards ought to be provided instead.

The fire-grates are of a very rude and wasteful construction, and should be replaced by remodelled grates to warm part of the admitted air.

The passage and stair windows should have glass louvres or perforated glass panes put into the top sashes.

There is no gas in this hospital. A perfectly ventilated burner is required for each ward, and the ventilating tube should be carried into the lower end of the outlet shaft.

There is no lavatory nor bath-room for the sick, and there are no waterclosets.

A projection might very easily be built behind the back of the staircase to contain two waterclosets, a lavatory with a few sunk basins with water laid on, and a bath with hot and cold water, supplied from the kitchen by means of pipes.

The kitchen is imperfectly furnished with the means of cooking hospital diets, and requires a new range. It also requires roof ventilation.

Adjoining the kitchen is the hospital wash-house, which requires fixed tubs and means of drying linen.

In the yard are privies of a construction similar to those of the barracks, and equally offensive. They require to be reconstructed as proper water latrines; a proper urinal should also be provided.

The drainage of the hospital yard is complained of as defective. It ought to be examined and remedied. Under the same roof with the cook-house and privy is a very offensive ashpit, which ought to be entirely removed, and the refuse ought to be collected in a suitable utensil and carried away daily.

This building has neither provision store, pack store, nor bedding store, and it has no space for receiving the sick of soldiers' families. It is, in fact, quite inadequate in accommodation for the strength of the barrack; it ought to be extended or rebuilt on a better plan.

*The following is a Summary of the Sanitary Requirements for the present Building:—*

1. Removing two beds out of each ward.
2. Carrying each ventilating shaft separately above the roof and terminating it with a louvre; removing the covers from the shafts within the wards; providing suitable inlets for air; remodelling the ward grates; ventilating the stairs and passages by glass louvres or perforated panes.
3. Providing a ventilating gas-burner for each ward.
4. Providing an ablution-room, bath-room, and two waterclosets in a projection behind the stairs.
5. Providing a new kitchen range, and ventilating the kitchen through the roof.
6. Providing fixed tubs for the wash-house, and the means of drying linen.
7. Reconstructing the privies as water latrines; providing a proper urinal; and improving the drainage.
8. Removing the ashpit, and providing for the daily collection and removal of the hospital refuse.

*The Infantry Hospital.*—This building has not been much used as a hospital; but it has been so used, and stands on the construction as a hospital. It is utterly unfit for sick, and cannot without rebuilding be made fit.

***The only recommendation we have to make is, that it be struck off the construction altogether.***

## II.—SUNDERLAND BARRACKS.

These barracks are situated at the eastern end of the town of Sunderland, on an angle of ground bounded on the north side by the river Wear, at a distance of about 100 yards, and on the east by the sea, at a distance of about 250 yards. Part of Sunderland Docks lie between the sea-shore and the barrack boundary. On the other sides there are numerous houses and manufactories belonging to the town, which are separated from the barrack enclosure by a narrow public highway. The situation, however, is open, airy, and healthy, and it is raised about 30 feet above the sea level. There is an area of 7A. 3R. 6P. within the boundary walls. The subsoil is clay and sand.

The buildings are partly of brick and partly of stone, and were erected early in the present century; they are arranged in three detached blocks forming a centre, with two wings at right angles to it. The centre contains officers' quarters, and the men's rooms are in the wings. The usual outhouses are arranged behind the blocks and close to the boundary walls. So far as concerns the general disposition of the buildings it is good, and conducive to free external ventilation.

Each range of men's barracks is two stories high, and is divided into three houses. Each house has an outside stair of stone, giving access to the rooms on the upper floor, and under the stone stair is placed the entrance to the ground-floor rooms. A small projecting porch shelters the upper entrance door.

The rooms open right and left of each entrance. They are, on an average, 38 feet long by about 23 feet wide, and from 8 feet 8 inches to 9 feet high. These proportions are not very good, as they give the rooms an appearance of being low and somewhat gloomy.

The total accommodation is for 316 non-commissioned officers and men. There are 16 serjeants' rooms of sufficient size. Each room gives nearly 1,600 cubic feet per man, but the men's rooms are considerably overcrowded, as will be seen from the following table:—

| Rooms. | Total present Regulation Number of Men. | Total Number at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Present Number of Men per Room. | Number of Men per Room at 600 Cubic Feet per Man. |
|---|---|---|---|---|---|
| B. Range, 8 rooms (Nos. 5 to 12) | 160 | 104 | 56 | 20 | 13 |
| E. Range, 7 rooms (Nos. 7, 8, 9, 18, 19, 20, 21) | 140 | 91 | 49 | 20 | 13 |
| Total | 300 | 195 | 105 | — | — |

The present number of men per room is 20. Throughout the barracks the space per man, in the great majority of instances, does not exceed 375 cubic feet. To give an average cubic space under 600 feet, it will be necessary to remove seven men out of each room.

The rooms have four windows, two on each opposite side, and there are two wire gauze panes in the windows in each room, which is the only provision for ventilation. The upper sashes of the windows are fixed, and the lower sashes open on pivots.

It will be necessary to ventilate all the rooms by shafts and inlets. One shaft of the required sectional area will have to be carried up from the ceiling of each room to above the roof. Each room will also require two inlets, one on each of the opposite sides of the room, placed close to the ceiling.

Each serjeants' room should have an Arnott's silk flap ventilator introduced into the chimney.

To complete the ventilation during winter, all the

fire-grates should be remodelled to save fuel and warm part of the air admitted.

All the barrack-rooms are lighted with candles, although gas is laid on within the square, and to the canteen. We would recommend that each room have a ventilated gas-burner introduced into it.

The porches belonging to these barrack-rooms would be very convenient places in which to put up night urinals, so as to do away with urine tubs. An earthenware urinal, with an ascending water current and an overflow, similar to the one in use in the Wellington barracks, would be well worthy of trial. It would have to be locked up during the day.

One of the 20-men rooms is fitted up as a school-room. It requires ventilation by a shaft, two inlets, and a remodelled grate like the barrack-rooms. It should also be lighted with gas. There is no day-room.

A room at the end of the officers' range is used as a library. It requires a silk flap ventilator into the chimney, and a gas-burner.

There are four ablution sheds, two behind each men's range, built against the boundary wall. They are very narrow and dark; they have no gratings nor pegs; and they have no beads to the tables.

These sheds require ventilating skylights in the roof, a bead to the tables, and gratings and pegs.

There are no baths, but four are to be provided this year.

Two similar sheds are used as women's wash-houses; one is 7 feet 8 inches broad, and the other is only 5 feet 9 inches broad. Both are inconveniently small, and they have no fixed tubs, gratings, nor drying stove. The adjoining cleaning sheds might be used to extend the washing accommodation, but of course other cleaning sheds would have to be provided.

There is no accommodation for married people, except the serjeants' rooms. Married soldiers whose wives are allowed in barracks sleep in the barrack-rooms with the men. Sufficient married accommodation for a barrack of this size might be possibly obtained by renting a house, and the present practice might at once be put a stop to.

There is no drill shed, and accommodation for trades is much required. At present the armourers' shop is in one of the cleaning sheds. There is no regimental storage of any kind.

An excellent supply of water is laid on to the barracks from the works of the water company.

The barracks are drained into the Wear at the dock basin, and all the privies are connected with the drainage, and can be flushed, but their construction is otherwise imperfect. The troughs are much too deep, and water does not stand in them. The buildings have neither light nor ventilation, except what comes from the door, and the seating is very defective.

These privies should be reconstructed as water latrines, with divisions of seats and half-doors; the buildings should be lighted and ventilated through the roof, and a receptacle, in which water will stand constantly, on the principle of Macfarlane's latrines, should be provided for each privy throughout the barracks.

The ashpits are very defective. They require to be raised above the surface, to be paved and drained, and the refuse to be frequently removed.

There are two cook-houses, one of which is new and of brick. It has boilers and ovens, but it would be improved by having more light. The other cook-house is old, and of wood. It hardly admits of improvement. It is disused at present.

The canteen tap-room and non-commissioned officers' room are low-roofed and unventilated. They require an Arnott's silk flap ventilator in the chimney, perforated panes in the windows, and a ventilating funnel and tube over the gas-burners.

The guard-room is defectively ventilated, and requires a shaft through the ceiling and roof, and a remodelled grate.

*The Sanitary Improvements required for Sunderland Barracks are the following:—*

1. Removing seven men out of each barrack-room.

2. Ventilating each room by shafts, inlets, and remodelled grates. School-room to be similarly ventilated. All the non-commissioned officers' rooms and the library to have Arnott's silk flap ventilators in the chimneys. Guard-room to have a shaft and remodelled grate. Canteen to be ventilated by silk flap ventilators, and perforated panes in the non-commissioned officers' room and tap-room. Gas-burners in the canteen to be ventilated.

3. A ventilated gas-burner to be placed in all the barrack-rooms, school-room, and library.

4. Ablution-rooms to have ledges put to the tables, gratings, and pegs, and ventilating skylights in the roofs. Two baths would be enough for the reduced strength consequent on giving 600 cubic feet per man.

5. Accommodation for washing clothes to be extended, fixed tubs, with water laid on, and drying and laundry stoves to be provided.

6. Privies to be reconstructed as water latrines, with suitable water receptacles, and to have light and ventilation through the roofs, divisions of seats, and half-doors.

7. Ashpits to be improved by raising the bottoms above the level of the ground, draining and paving them, and providing for frequent removal of the refuse.

8. New cookhouse to have more light through the roof.

*Sunderland Barrack Hospital.*

This is a very defective building in which to place sick men. It is only one story high, and its floor rests immediately on the ground. It is situated in the lower angle of the barrack enclosure, with the boundary wall on two sides of it. The hospital itself is in two blocks, placed at right angles to each other; and behind them there are two small confined yards, in one of which is the kitchen and dead-house, and in the other a urinal, privy, and ashpit. There is no enclosure separating the hospital from the barrack yard, and no place for convalescents taking exercise.

In one block of the hospital are placed a nurses' room, surgery, and one ward; in the other block are three wards opening out of each other.

The whole plan and arrangements are so defective that it would be well to consider whether a new hospital could not be provided for this station. We shall, however, deal with the place as it is.

There are in all four wards, with regulation space for 28 beds. A third of the beds have only 427 cubic feet of space each. About another third have under 500 cubic feet, so that the wards are excessively overcrowded.

The following table will show the extent of this:—

| Wards. | Present. Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Bed Spaces. |
|---|---|---|---|
| 1 | 10 | 4 | 6 |
| 2 | 4 | 3 | 1 |
| 3 | 9 | 4 | 5 |
| 4 | 5 | 5 | 3 |
| Total - | 28 | 16 | 15 |

The space in these wards will not divide equally by 1,200, and if a little more than 1,200 cubic feet were allowed to each bed, the hospital would contain 10 beds. Under the circumstances of the case, however, we should advise, for the present at least, that 15 beds be removed out of the wards, in the proportions shown in the table.

The ventilation in all the wards is deficient, and should be provided for by a shaft being carried up from the ceiling through the roof in wards 1, 3, and 4. Ward 2, which has space only for one bed, may have a sufficient outlet by introducing a silk flap ventilator into the chimney. Each ward, except No. 2, should have two inlets for air, and No. 2 should have one inlet. All the wards require remodelled grates.

The passage window requires perforated panes in the upper sash.

The present means of lighting is by candles. A ventilated gas-burner is required for each ward.

There are no proper means of washing or bathing the sick. The shower bath stands in the open air.

A small building having a covered connexion with the sick wards should be provided, and a fixed bath, with hot and cold water laid on, and an ablution table, with sunk basins and water laid on, should be put up in it.

As there is no watercloset for the sick, one such convenience should at the same time be constructed.

There is no hospital wash-house, and there is certainly no room for one in the back yard.

The kitchen is only indifferently provided with means of cooking.

Water is obtained from the water company's works.

In the back yard are flushed privies, which ought to have a receptacle provided for holding water. A small ashpit in the yard should be removed entirely.

There are no stores of any kind.

The dead-house is dark, and requires a skylight.

There is no sleeping accommodation for orderlies, except in the wards.

*The Sanitary Improvements required for this Hospital are:—*

1. Removing 15 beds out of the wards.
2. Ventilating the wards by shafts, inlets, and remodelled grates, and ventilating the passage by perforated panes in the window.
3. Introducing a ventilated gas-burner into each ward.
4. Providing a watercloset connected with the hospital.
5. Providing a bath and a proper ablution table, with hot and cold water laid on.
6. Converting the privies in the yard into water latrines, and removing the ashpit.
7. Providing a ventilating skylight for the dead-house.

## III.—TYNEMOUTH CASTLE.

Tynemouth Castle is situated on a promontory about 100 feet high, with the sea on one side and the estuary of the Tyne on the other. One extremity of the village of Tynemouth comes within about 100 yards of the landward side of the enclosure, otherwise the castle is completely isolated from buildings.

There is an area of 9A. 3R. 15P. within the enclosure. The centre of the area is occupied by the ruins of Tynemouth priory and an ancient burying-ground about to be abandoned. The barracks, canteen, and hospital are situated, as it were, round the priory and burial-ground. The buildings are of brick and stone; part of them date from the Norman period, and part are modern.

The old castle of Tynemouth is situated at the west side of the enclosure, and an archway which passes under it affords the only means of access to the interior. There are four barrack-rooms in the castle, reached by narrow, tortuous, dark stairs; the rooms are large, low-roofed, and defectively lighted, and are not well suited for the accommodation of soldiers.

There are six barrack-rooms in the newer buildings, which are of better construction, and more adapted for their object than the old rooms in the castle.

All of them are overcrowded, and they are all without proper means of ventilation.

The following table shows the present regulation accommodation compared with what it would be at 600 cubic feet per man:—

| Rooms. | Total present Regulation Number of Men. | Total Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| A. Range. | | | |
| No. 1 - - | 22 | 14 | 8 |
| „ 2 - - | 23 | 11 | 12 |
| „ 3 - - | 24 | 14 | 10 |
| „ 4 - - | 24 | 18 | 6 |
| B. Range. | | | |
| No. 1 - - | 23 | 16 | 7 |
| „ 2 - - | 22 | 17 | 5 |
| „ 3 - - | 27 | 21 | 6 |
| „ 4 - - | 25 | 20 | 5 |
| „ 5 - - | 22 | 17 | 5 |
| „ 6 - - | 22 | 16 | 6 |
| Total - | 234 | 164 | 70 |

This table shows a deficiency of accommodation for 70 men; and the remainder, namely, 164 men, would have as near as may be 600 cubic feet per man, were the excess of inmates removed from the rooms.

Both ranges of barrack-rooms will require somewhat different methods of ventilation. The upper room in the castle should be ventilated through the roof by Mackinnel's or Muir's ventilator, either of which will act by supplying fresh air and giving exit to foul air. The lower rooms should have outlet shafts of the usual construction carried from the ceiling to above the roof. The chief difficulty in the lower rooms of the castle is to find a means of supplying fresh air, on account of the thickness of the walls.

We should propose to do this in the meantime by placing two squares of perforated zinc or of perforated glass in the upper range of panes in each window. The difficulty of finding inlets for fresh air will also prevent the introduction of remodelled grates of the usual form we have hitherto recommended, instead of which we would recommend a form of grate projecting into the room, and with a contracted draught below, on the principle of the Anglo-American stove.

The more modern rooms in B. range should have shafts, inlets, and remodelled fire-grates. Each room will require one shaft and two inlets.

The staircases in both ranges should be ventilated by panes of perforated zinc or glass put into the windows; and in B. range a shaft about nine inches square should be carried from the ceiling of the staircase through the roof.

The rooms are lighted with gas, but none of the burners are ventilated. They should each have a ventilating funnel and a tube carried from it into the chimney.

A room is used as a school-room and library. It ought to be ventilated like the other barrack-rooms.

There is no day-room nor drill shed.

There are two narrow ablution houses built as lean-to sheds against the ramparts. They have no pegs nor gratings, and there are no ledges to the ablution tables.

These deficiencies require to be supplied.

There are no baths, but it was stated to us that two baths had been authorized.

There is a women's wash-house fitted up with boilers and benches. It requires fixed tubs, gratings, and a drying and laundry stove.

The cook-house is in the old castle, and at a considerable distance from the rooms in B. range.

We were informed that a new one with ovens is about to be built near the rooms in B. range, and the present cook-house is to be abolished.

A better tailors' shop is required. The present one consists of two small flagged damp rooms in the old buildings, quite unfit for their purpose.

An abundant water supply has lately been introduced within the enclosure. It is derived from the company's mains.

The privies are of the usual ladder construction, and are drained to the sea through earthenware pipes. They require sluicing to keep them clean. They should be reconstructed as water latrines on Macfarlane's principle, with divisions of seats, half-doors, light, and ventilation.

The urinals consist of stone troughs, and are not of good construction. They should be reconstructed and supplied with water for cleansing.

Ventilation is required for the canteen tap-room and non-commissioned officers' room. It should be given by means of silk flap ventilators and perforated glass panes.

There is no accommodation for married soldiers, except two rooms for staff serjeants, and five berths in the men's rooms. Married women allowed in barracks are accommodated in soldiers' rooms when the occupation admits of it.

*The following sanitary improvements are applicable to all the barracks in Tynemouth Castle;* but even if they were all carried out, we should not advise the rooms in range A. to be constantly occupied. They are not healthy rooms, and should only be used on emergency.

1. Reduction of numbers in all the rooms to the extent stated.

2. Ventilation and warming of the barrack-rooms and library by shafts and inlets, and remodelled grates as described; staircases to be ventilated by shafts and perforated panes; gas-burners to be ventilated; canteen tap-room and non-commissioned officers' room to be ventilated by silk flap ventilators and perforated panes; serjeants' rooms to have silk flap ventilators into the chimneys; guard-room fire-grate to be improved so as to throw out more heat, in the manner advised for the other rooms in A. range.

3. Ablution-rooms to be provided with pegs, gratings, and ledges to the tables. The two baths authorized to be put up, and water to be laid on to them.

4. Women's wash-house to have fixed tubs, gratings, and a drying and laundry stove.

5. New cook-house, with proper means of roasting, baking, and boiling, to be erected in place of the present one.

6. Privies to be reconstructed as water latrines, on Macfarlane's principle, and to have water laid on, divisions of seats, half-doors, light, and ventilation. Urinals to be reconstructed and supplied with water.

### *Tynemouth Castle Hospital.*

The hospital occupies part of what was formerly the governor's house, and the remainder is occupied by the barrack offices and serjeants' quarters. The building is two stories high, with a deep basement beneath. On the ground floor of the hospital, part is the surgery and a sick ward, and the remaining sick wards are above.

The following table shows the accommodation in the wards :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 - - | 4 | 2 | 2 |
| 2 - - | 4 | 2 | 2 |
| 3 - - | 4 | 2 | 2 |
| 4 - - | 9 | 5 | 4 |
| 5 - - | 6 | 3 | 3 |
| Total - - | 27 | 14 | 13 |

This table shows a deficiency of space of nearly one half, and the sick have at present about the same cubic space as that which we have been allotting for healthy men in barracks.

There is, however, a ready way of increasing the accommodation, and that is by devoting all the rooms in the building for sick, and finding accommodation for the medical officer, barrack office, &c. elsewhere. This would add considerably to the space so much required, and we would recommend its being done at once.

There is a good wide hall and staircase; both require ventilation by a shaft carried through the ceiling of the stair, and by perforated glass panes in the stair windows.

The rooms are defectively lighted, with one exception, in which there are three windows to the ward. The other four wards have one window each. In short, the building not having been constructed for a hospital, is not well adapted for one.

None of the wards have sufficient means of ventilation, and they will require shafts, inlets, and remodelled grates. One inlet for each ward will suffice. They are lighted with gas, but the burners require ventilation by funnels and tubes carried into the chimneys.

There is no lavatory and no fixed bath. One bath with hot and cold water laid on, and an ablution table on Macfarlane's principle, should be put up in a convenient position within the building.

There is a watercloset within the building, but not for the use of the sick, who are obliged to go to the privies in the yard behind. The sick should be permitted to use the watercloset when the whole building is given over to them, and the privies in the back yard should be converted into a Macfarlane's water latrine. There is plenty of water at hand, and drainage already exists.

In providing a bath it will be necessary to lay on water to the hospital.

There is a deep damp basement under the hospital; part of it is used for a kitchen for officers. This basement is quite unfit for any purpose connected with a hospital.

In the yard behind is the kitchen of the hospital. It is not properly provided with means of cooking, and requires a proper range.

The hospital stores are in a detached building behind.

*The following are the Sanitary Improvements required for this Hospital :—*

1. Removing all quarters and offices, except those for sick, out of the building, and converting the vacated rooms into wards.

2. Reducing the number of sick in the present wards, and distributing them over the building, so as to give, as near as may be, 1,200 cubic feet per bed.

3. Ventilating the wards by shafts, inlets, and remodelled grates; ventilating the passage and staircase by a shaft through the roof and perforated panes in the windows.

4. Ventilating the gas-burners.

5. Providing a bath and ablution table, and laying on water to the hospital.

6. Converting the privies into water latrines.

7. Providing a cooking range for the hospital kitchen.

## IV.—CARLISLE CASTLE.

Carlisle Castle is situated at the north-west extremity of the town, at its outskirts, and overlooks the open country. It covers an area of rising ground 4A. 1R. 17P. in extent. There are houses and manufactories within a short distance of the boundary, particularly on the side nearest the barracks, and great nuisance is experienced in the rooms from clouds of smoke disengaged from the factory chimneys, no attempt being apparently made to effect its consumption. To such an extent is this nuisance experienced, that it is at times impossible to open the barrack-room windows to admit fresh air.

We are of opinion that legal measures should be adopted to abate the nuisance complained of.

The position of Carlisle Castle is well adapted for drainage. The river Eden passes at a distance of 266 yards from the northern wall. The barrack buildings are of stone and brick. Part are of great antiquity, and the more recent structures date from 1836–37. They are in four ranges, B., E., G., and K. The two former ranges are modern in construction. The two latter are very old. Besides the barrack-rooms in these ranges, there is a single soldiers' room in A. range at the gate.

The barrack-rooms are in some points good rooms, but they are deficient in several important sanitary requirements.

B. range is three stories high, and is built close to the western boundary wall. Besides officers' quarters, it contains three serjeants' rooms and three soldiers' rooms. The latter have four windows each, two at either end of the room. The rooms are 34 feet long by about 20 feet broad, and from 10 feet to 10 feet 4 inches high, and each room has regulation accommodation for 18 men, with an average cubic space considerably under 400 feet per man.

E. range fronts the upper end of the parade ground, at right angles to B. range. It is a single block, consisting of a centre and two wings; part of it was formerly used as an armoury. It is two stories high, and contains 10 barrack-rooms, varying in height from 11 feet 6 inches to 16 feet 9 inches. The rooms are from 30 to 60 feet in length, and from about 15 to 20 feet in breadth.

In the loftier rooms the men have about 630 cubic feet each, without any increase of superficial area for their beds, and in the less lofty rooms the space allowed per man is from under 400 to somewhat under 500 cubic feet.

The larger rooms run through and through the building, and have three windows or two windows in each of the opposite end walls. The smaller rooms are back to back, with three windows each on one side only. The large rooms are rather dark, and part of the window space in them has been built up to form loopholes. It would be very advantageous to these long rooms to provide more light, either by opening additional windows or by enlarging the present ones. Each room in this building has a serjeant's bunk in the corner, which further obstructs the light.

There are two tolerably good lofty barrack-rooms in the old keep, but the remaining rooms are by no means good, and should be occupied only on emergency.

The following table shows the regulation accommodation in all the rooms, compared with what it would be at 600 cubic feet per man:—

| Rooms. | Present Regulation Accommodation. | Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| A. Range. | | | |
| No. 1 | 6 | 3 | 3 |
| B. Range. | | | |
| No. 2 | 18 | 11 | 7 |
| „ 4 | 18 | 12 | 6 |
| „ 6 | 18 | 12 | 6 |
| E. Range. | | | |
| No. 1 | 12 | 12 | — |
| „ 2 | 12 | 12 | — |
| „ 3 | 12 | 12 | — |
| „ 4 | 12 | 12 | — |
| „ 5 | 12 | 9 | 3 |
| „ 6 | 13 | 9 | 4 |
| „ 7 | 14 | 9 | 5 |
| „ 8 | 13 | 9 | 4 |
| „ 9 | 30 | 30 | 2 |
| „ 10 | 33 | 26 | 7 |
| G. Range. | | | |
| No. 1 | 9 | 6 | 3 |
| „ 2 | 9 | 7 | 2 |
| K. Range. | | | |
| No. 1 | 15 | 15 | — |
| „ 2 | 16 | 16 | — |
| Total | 274 | 222 | 52 |

There is accommodation in these rooms for 222 men at very nearly 600 cubic feet per man, but the number 222 exceeds the accommodation available, at least for ordinary occasions. Room No. 1 in A. range, and rooms Nos. 1 and 2, in G. range, as already stated, are only fit for occupation in case of emergency, and as they would hold 16 men at about 600 cubic feet each, these ought to be deducted. The actual good accommodation, therefore, is only sufficient for 206 men.

None of the rooms are ventilated. Those in ranges B. and E. should have each a shaft carried from the ceiling to above the roof, and two inlets for admitting fresh air, placed close to the ceiling, one at each end of the room. All the fire-grates are of the old construction, and might be advantageously remodelled to warm part of the air admitted. The stairs of these ranges should have louvres carried up through the roof, and perforated glass panes in the windows, to keep a current of air through the staircases and passages. The upper flight of stairs in range B. requires a window at the back. Each non-commissioned officers' room should have an Arnott's silk flap ventilator introduced into the chimney. Those in range B. would be much improved by having an additional window at the back.

The barrack-rooms in ranges A. and G. should have shafts and inlets like the others, if the walls and roofs admit of their being introduced. But if not, a large-sized Arnott's ventilator should be placed in each chimney, and a few squares of perforated zinc in the upper row of window panes.

The large men's rooms in the old keep should have Arnott's ventilators into the chimney and perforated zinc squares in the top window frames at each of the opposite ends of the rooms. Remodelled grates are necessary in these and in all cases where chimney ventilators are used, and where the chimney throat is too open below.

Gas is used for lighting the stairs, and candles are used in the barrack-rooms. One or more ventilated gas-burners should be introduced into each barrack-room, according to its size.

There are two ablution-rooms, one for B. range, the other for K. range, with accommodation for 62 men at a time. They are long, narrow, lean-to sheds, built against the rampart walls. They have water laid on by tanks, slate benches, and forms, but the tables have no beads, and there are no pegs nor gratings. These defects ought to be supplied, and the sheds themselves ought to be ventilated by louvres through the roofs.

There are no baths. Two are required, with water laid on.

There is a women's wash-house with two boilers and benches, but it requires fixed tubs, gratings, a drying and laundry stove, and ventilation through the roof.

There are three cook-houses with boilers and recently erected ovens. They are too dark.

Water is derived from wells, tanks, and the water companies' mains. It is said to be sufficient in quantity.

The privies belonging to these barracks are on a very bad plan, and they are very defectively constructed. They are placed over a drain connected with the town sewers, and a small quantity of water is used to flush them. The wall between them and the ashpit is broken through, and the contents of the privies escape into the ashpit; while the pipe drain intended to remove the soil is broken, and allows the fluid part to run on to the parade ground.

The whole should be reconstructed with as little delay as possible. Macfarlane's latrines should be introduced, the drainage rectified, water should be laid on, and the latrines should have divisions of seats, half-doors, and light and ventilation supplied through the roof. Proper water urinals should be at the same time constructed in place of those now in use. The parade ground drainage should be improved at the same time.

The ashpit should be removed entirely, and an iron cart substituted for collecting and removing the refuse once a day.

The canteen tap-room has a partition across part of it to enclose a bed. This ought to be removed, and more light admitted if practicable. The room is too dark at present. It ought to be ventilated by an Arnott's ventilator into the chimney and perforated glass panes in the windows. The room for non-commissioned officers should be similarly ventilated.

The drain and privy behind the canteen are in a very offensive state. A Macfarlane's water latrine should be put up instead of the present privy, the drainage should be improved, and the cesspit abolished.

The school-room is in one of the small rooms near the gateway. Some provision has been made for ventilating it by a shaft carried into the roof. The shaft should be carried up through the roof into the open air, and panes of perforated glass should be placed in the upper window-sashes to act as inlets.

There is a library, a very small room, only large enough to contain the books, but by no means sufficient for a reading-room. The librarian's quarter is dark, and should have a window at one side.

The guard-room is under the gateway. It consists of two divisions, one within the other. The inner room has a fire-place, but not the outer room. It requires ventilation by a shaft. Adjoining the guard-room is a row of cells, reached by a passage open above to the outer air. There is no provision for warming these cells. The passage should be roofed over, a stove properly supplied with fresh air should be provided, and the fresh air warmed by the stove should be admitted to the cells and guard-room by suitable openings. A drain passes under the lock-up room. It ought to be abolished, as it is dangerous in such a situation. Besides the guard-room cells, there are two good cells belonging to the provost establishment, which appear to be sufficiently warmed and ventilated.

The quarters of the barrack serjeant are in a one-story cottage built close to the rampart wall. The back room of the cottage is dark, and without means of ventilation, and it is not healthy. It requires a window through the back wall, which could easily be made.

Carlisle Castle is deficient in day-rooms, drill shed, workshops, and married soldiers' quarters.

At present the tailors' and shoemakers' shops are in the basement of B. range. They are dark and damp, and very unfit for their purpose.

There are no staff serjeants' quarters and no proper serjeants' mess.

*The following are the Improvements required for Carlisle Castle Barracks:—*

1. Reduction of the numbers of men in each room to the extent stated.

2. Ventilation of each barrack-room in ranges B. and E. by shafts, inlets, and remodelled grates. Staircases in these ranges to be ventilated by a shaft through the ceiling and by perforated panes in the windows. An additional window to the back to be opened in the staircases of range B.

Ventilation of the rooms in ranges A. and G. by shafts and inlets, if possible, or, if not possible, by Arnott's ventilators and perforated zinc panes. Ventilation of the rooms in range K. by Arnott's silk flap ventilators into the chimneys, perforated glass or zinc panes in the windows, and remodelled grates. Ventilation of the school-room by a shaft and inlet. Ventilation of the guard-room by a shaft. Improving the ventilation and warming of the cells as described.

All non-commissioned officers' rooms to be ventilated by Arnott's ventilators. Barrack serjeants' house to have a window at the back. Canteen tap-room and non-commissioned officers' room to be ventilated by Arnott's ventilators and perforated glass panes in the windows.

3. Ventilated gas-burners to be introduced into all the barrack-rooms.

4. Ablution-rooms to be improved by being ventilated through the roof, and having gratings, pegs, and beads to the ablution tables provided.

5. Two baths with water laid on are to be provided.

6. Women's wash-house to be improved by ventilation through the roof, and to have fixed tubs, gratings, and a drying and laundry stove.

7. Cook-house to have additional light admitted.

8. Drainage of the parade ground to be improved. Privies to be entirely reconstructed as water latrines on Macfarlane's principle, with divisions of seats, half-doors, light, and ventilation, and to be properly drained. Canteen privy to be reconstructed as a water latrine, properly drained. Proper urinals to be provided.

Ashpit at the soldiers' privies to be abolished, and an iron cart for daily removal of the refuse to be substituted.

Lastly, legal steps ought to be taken to suppress the smoke nuisance complained of.

*Carlisle Castle Hospital.*

This is one of the worst army hospitals we have inspected. It was originally the dwelling of the Lieut.-Governor of the castle, and is not only a bad specimen of house architecture, but not having been intended for a hospital, it is unadapted for such a purpose. We think, nevertheless, that by additions and improvements, it may be made to answer its object within certain limits.

The house is situated at the upper end of the parade ground, towards which it faces, without any enclosing wall, and it is built so close to the high rampart behind that there is only a small narrow court behind, into which are crowded the hospital kitchen, dead-house, privies, &c.

The building is three stories high. On the ground floor are placed the surgery and serjeants' room; over these are a flat of wards; and over these again are low attics, one of which is intended as an itch ward.

There is another ward in a lean-to built against one end of the house, but this ward has its floor below the level of the ground.

There are altogether four wards and 20 beds, and the following table will give an idea of the amount of overcrowding which at present exists in the wards:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 - - | 8 | 3 | 5 |
| 2 - - | 5 | 1 | 4 |
| 3 - - | 5 | 1 | 4 |
| 4 - - | 2 | — | 2 |
| Total - - | 20 | 5 | 15 |

If the cubic space in all the wards were thrown together and divided by 1,200, there would be room in the building for seven beds, instead of 20; but if the rooms are to be taken one by one, ward No. 1 cannot hold four beds, wards Nos. 2 and 3 cannot hold two beds each, and ward No 4. is quite unfit for occupation, and should be struck off the construction at once.

There is space, therefore, for five beds in the building.

The present amount of space per bed is from 391 to less than 500 cubic feet, and exhibits the largest extent of overcrowding we have met with.

Notwithstanding this great overcrowding, there are no means of ventilation, and some of the windows do not open at top. We would propose to remedy this defect as follows: A window should be broken through the back wall of each of the first-floor wards. Each ward should have a shaft and inlet, and the staircase should have a louvre through the roof and perforated glass panes in the windows.

A ventilated gas-burner should also be introduced into each ward.

The following are the present deficiencies of accommodation in the hospital:—There is no accommodation for orderlies. There are no means of washing or bathing sick or convalescents. There is no wash-house. The kitchen is imperfectly supplied with the means of cooking. There is no watercloset connected with the wards; but there is a water latrine in the back yard. There is no provision store and no pack store.

The only way to improve this hospital is to extend it, and it can be done. At one end of the present building there is a large area of ground used as a barrack drying ground. This ground could be quite well used for the erection of two or three good wards, and in connexion with them the deficiencies we have pointed out might be provided for.

*Our Recommendations, then, for Carlisle Castle Hospital are as follow:—*

1. To extend the hospital so as to afford the required per-centage of sick accommodation at 1,200 cubic feet per bed, with ablution and bath room, watercloset, &c.; and until this is done, to make temporary provision for the sick by a hospital hut or otherwise.

2. To open windows in the back walls of the present wards, to make all windows open at top, and to ventilate the wards and staircases by shafts and inlets as described.

JOHN SUTHERLAND.
W. H. BURRELL.
DOUGLAS GALTON.

*To the Secretary of State for War.*

Barrack and Hospital Improvement Commission,
August 12, 1859.

---

# NORTH BRITISH DISTRICT.

SIR,

HAVING completed our inspections and inquiries with regard to the barracks and hospitals in the North British district, we have now the honour to report the results. We have inspected the following barracks in this district:—

| | | |
|---|---|---|
| I. | Edinburgh | 1. The Castle, Infantry. |
| | „ | 2. Piershill, Cavalry. |
| | „ | 3. Leith Fort, Artillery. |
| II. | Berwick-on-Tweed | Infantry. |
| III. | Stirling | The Castle, Infantry. |
| IV. | Glasgow | 1. Infantry. |
| | „ | 2. Recruiting. |
| V. | Ayr | Infantry. |
| VI. | Paisley | Infantry. |
| VII. | Hamilton | Cavalry and Infantry. |
| VIII. | Dumbarton Castle | Artillery. |
| IX. | Fort Augustus | Infantry. |
| X. | Aberdeen | 1. Infantry. |
| | „ | 2. New Fort. |
| XI. | Dundee | Infantry. |
| XII. | Perth | 1. Infantry. |
| | „ | 2. Victoria Street. |
| XIII. | Fort George | Infantry and Artillery. |

We shall report on each barrack and hospital separately.

## I.—EDINBURGH.

### 1. EDINBURGH CASTLE.

The buildings of Edinburgh Castle cover an irregularly shaped area 11 acres in extent on the summit and slopes of the Castle rock, at an elevation of from 350 to 431 feet above the level of the sea. They consist of structures of different eras; some are of great antiquity and others are of recent erection.

The more ancient buildings are the palace, part of which is used for the canteen and for soldiers' quarters, and the Parliament Hall, now appropriated as a hospital.

The more recent buildings are a large block of barracks erected at the end of last century, the governor's house, ordnance stores, &c., and the expense magazine, recently converted into a temporary barrack on the dismantling of a large old barrack which adjoins the palace.

The older buildings are arranged in square. The newer ones are in line. The whole are freely exposed to the high winds which blow over this elevated part of the city, and any external stagnation of air is impossible. The situation is an exposed though a healthy one, but the barracks themselves are not amongst the most healthy in Scotland. The mortality in them during the last five years has been 14 per 1,000 per annum; a death-rate considerably above the army average for Scotland for the same five years, which has been 9·3 per 1,000, and much greater than in the other barracks in the city and neighbourhood. The facts in the following table of mortality for five years ending 1858–59 have been furnished to us by the principal medical officer on the station:—

| Years 1854 to 1859. | Average Strength. | Total Deaths. | Annual Ratio of Mortality per 1,000 Strength. | Deaths from Consumption and other Chest Diseases. | Deaths from Fever and Eruptive Fevers. |
|---|---|---|---|---|---|
| Edinburgh Castle, Infantry | 698 | 50 | 14 | 22 | 13 |
| Piershill, Cavalry | 488 | 12 | 5 | 6 | 1 |
| Leith, Foot Artillery | 232 | 5 | 4⅓ | 1 | 2 |

Of the 50 deaths occurring in Edinburgh Castle during the period 13 deaths took place from phthisis, and 13 from fevers and eruptive fevers. Six of the latter deaths were from small-pox.

The annual mortality from chest diseases and fevers has in Edinburgh Castle been in the ratio of 10 per 1,000 strength. At Piershill barracks, about two miles distant, it has been under 3 per 1,000, and at Leith Fort about 2½ per 1,000 strength.

The mortality in different corps is to a certain extent influenced by their constitution and by the greater or less activity in invaliding, but making

every allowance for these disturbing causes, there is a sufficiently large balance of mortality against Edinburgh Castle to lead to the inquiry how it happens that so considerable an amount of consumption and fever occurs in buildings occupying one of the most airy and healthy sites in the country.

To what extent this result, and the almost constant recurrence of small-pox among the troops, may be attributable to the defective construction, want of ventilation, and overcrowding of the barracks we shall presently see.

The greater part of the troops are in the *New Barrack*. This is a large block of building situated on a ledge cut out of the basaltic rock. It faces east and west. On the west side the buildings are seven stories high. On the east side the rock is only a few feet from the back windows of several of the lower flats from which it is divided by a narrow area.

The entrance to this large barrack is by a double passage about half way up in the east front of the building, from which the barrack-rooms are reached by ascending and descending the stairs.

There are 53 barrack-rooms in the building, arranged in a similar manner to that adopted in many cavalry barracks. A long dark corridor branches right and left from the central stairs, and the barrack-rooms are entered right and left from the corridor. But there is one very important difference in the arrangements, that, whereas, in cavalry barracks the corridors have generally large windows to the open air at the ends, those in this barrack are closed at the ends by officers' quarters, which occupy the extremities of the block.

The barrack-rooms have only one window each to the open air, and a small window to the corridor for affording some light to the latter. Forty-five of the rooms are 18 feet long, 17 feet broad, and 10 feet high. The remaining rooms are 8 feet high.

Considering the purpose which the building is intended to serve, this new barrack is a very unfavourable specimen of barrack architecture and arrangement. The structure is complicated. The rooms of the various stories are all connected together by gloomy passages and corridors. The proportion of window space is very small, and the means of ventilation afforded by the construction are quite inadequate for the number of inmates.

The overcrowding throughout the building is excessive. It contains 447 men under one roof. One room capable of holding 6 men gives the largest amount of space per man in the building, and that is only 302 cubic feet. One 12-men room exhibits the most excessive degree of overcrowding we have anywhere met with. In this instance the space returned to us by the barrack-master is only 181 cubic feet per man. The remaining rooms afford an amount of space varying between these two extremes.

The following table shows the total present accommodation in the *New Barracks*, in contrast with what it would be at 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation in Men. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 1 | 12 | 6 | 6 |
| 2 | 12 | 6 | 6 |
| 5 | 12 | 6 | 6 |
| 6 | 12 | 6 | 6 |
| 7 | 12 | 6 | 6 |
| 15 | 12 | 4 | 8 |
| 13 | 6 | 5 | 1 |
| 18 | 9 | 6 | 3 |
| 45 8-men Rooms | 360 | 225 | 135 |
| Total 53 | 447 | 270 | 177 |

These rooms ought not to contain more than 270 men, and 177 men will require to be accommodated elsewhere. The numbers in the 12, 6, and 9-men rooms will have to be reduced to the extent shown in the table, and the numbers in the 45 eight-men rooms will have to be reduced to 5 men per room. The remaining men will have less than 600 cubic feet per man ; but considering the airy position of the barrack, and taking into account the improvements we are about to suggest in the building, we are of opinion that the numbers per room given above may be safely accommodated in them.

But while we concede this much as regards the question of cubic space, we must, at the same time, state that the attics and basement of these barracks are hardly fit for occupation. The former have their entrance from the top of the barrack staircase, and receive the foul air from the unventilated flats below. The basements are arched, and several of them were occupied by married people when we were there. The basement rooms behind and nearest the rock have no direct communication with the external air. Several of the basement rooms had the windows entirely open, but they nevertheless smelt abominably, and they cannot be healthy. Small-pox has prevailed among the children in these basements.

They are, at all events, not fit to be inhabited by a number of human beings. In other words, they are not fit for barrack-rooms.

The rooms in the second flat on the eastern side are so gloomy from the wall rising in front of them, that the men can scarcely see to dress, and the stairs leading to them are so dark that it is necessary to keep lights in them to prevent accidents.

In case of emergency rooms of this description would of course have to be occupied ; but surely at all ordinary times such places should be struck off the construction of barracks. If all the rooms which it is unadvisable to occupy were thus struck off, and a sufficiency of cubic space given in the remaining rooms, there would only be a small amount of really good barrack accommodation in the Castle.

No part of the building is ventilated. We thus have the three elements of bad construction, overcrowding, and defective ventilation all bearing against the health of the inmates, who, if they have not suffered more than they have done from zymotic and pulmonary diseases, owe it more to the healthy local position of the barrack than to its construction and internal arrangements.

The first thing to be done with this building is to improve its ventilation, beginning with the corridors and stairs. Were it at all practicable we would recommend the line of the corridors to be carried from end to end of the block, so as to open directly to the external air by windows of the same breadth and height as the corridor. To do this, however, it would be necessary to carry the corridor right through the middle of the officers' quarters, and it would be necessary in all probability to remove the officers' quarters out of the block, and rebuild them elsewhere ; but in doing this some of the additional space, so much required for the men, would be obtained, and the whole block would be very much improved in its sanitary state.

Next, it will be necessary to have a free circulation of air up the centre of the building by a series of large gratings placed at intervals in the floors of the corridor one over the other from the lower story to the roof, and to place large louvres in the roof to admit of free egress for the foul air from below. One of these louvres ought to be placed at the top of the staircases, and all the staircase windows ought to have perforated glass panes in the upper row of the window sashes.

Each room should be ventilated separately, and should have a foul-air shaft carried from the corner of the ceiling to above the roof, and an inlet from the outer air placed close to the ceiling.

All the fire-grates should be remodelled to warm

part of the admitted air. At present these grates are very wasteful of heat and fuel.

*The Old Barracks* are on the summit of the castle rock. They are arranged in square. One side of the square is formed by the Old Palace, part of which is now occupied as men's rooms, and the canteen.

On the adjoining side of the square is the old Parliament Hall, now used as a hospital. The next side of the square consists of old buildings adapted for barrack-rooms ; and the fourth side is completed by a building which was formerly divided into soldiers' rooms, but which has recently been dismantled in connexion with the contemplated improvements in the Castle.

The following table shows the existing accommodation in the *Old Barracks* :—

| Rooms. | Total present Regulation Accommodation in Men. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 1 | 12 | 12 | — |
| 10 | 12 | 8 | 4 |
| 12 | 12 | 6 | 6 |
| 3 | 16 | 14 | 2 |
| 5 | 16 | 9 | 7 |
| 2 | 18 | 14 | 4 |
| 9 | 18 | 11 | 7 |
| 4 | 10 | 7 | 3 |
| 6 | 7 | 4 | 3 |
| 7 | 7 | 4 | 3 |
| 11 | 6 | 4 | 2 |
| Total | 134 | 93 | 41 |

The old barracks will accommodate 93 men at less than 600 cubic feet per man ; and we are of opinion that no more than the number specified above ought to be placed in each room.

The barrack-rooms vary in structure. Five of them are only eight feet high, three are nine feet high, and three are 12 feet high. Some are gloomy ; all are unventilated ; and several of the rooms are shored up on account of their dilapidated condition.

One or two of the rooms have two chimney flues. One of these should be converted into a foul-air shaft, by making an opening into it close to the ceiling and closing the fire-place below.

The rooms in the Old Palace should have shafts carried up through the roof, and inlets for fresh air might be provided over the doors.

The external walls are very thick, and it would be unadvisable to make openings in them.

In the buildings on the west side of the square foul-air shafts should be carried from the corners of the rooms which have not two fire-places, and inlets might be sufficiently provided for these rooms by remodelling the grates.

The school-rooms, serjeants' mess, and workshops should also be ventilated in a similar manner.

The barrack accommodation in the expense magazine consists of eight long narrow rooms with shed roofs. They are entered from a central passage, and have one window at the end opposite the door, but they have light and ventilation through the roof. These rooms are so narrow that there is a breadth of 18 inches only from foot to foot of the opposite beds. They accommodate at present 16 men each, at 439 cubic feet per man, or 128 men in all. These rooms are considerably overcrowded, and several cases of small-pox have occurred among the men occupying them. As they are only intended for temporary occupation, it is not necessary to make any recommendations regarding them.

There are several men's rooms in Edinburgh Castle with flagged floors. These floors ought all to be boarded.

The ablution accommodation is as follows :—In the new barracks it consists of four narrow rooms, made out of passages in the different floors of the barracks. One of these rooms is almost dark. They have slate tables and gratings, but they require pegs for hanging clothes on, and the tables are not all supplied with beads to prevent the water dashing over on the men. Several baths have been put up, which are separated from each other by curtains.

We have several times objected to dark and unventilated ablution-rooms being placed within buildings where men live and sleep, on account of the additional dampness of the air arising from so large an extent of constantly wet surface being exposed.

When the new barracks were constructed ablution accommodation does not appear to have been provided in the plan, and the present arrangement is perhaps the only one which could have been adopted in such a building.

Ablution and bath rooms should have a ventilation quite independent of that of the barracks, and this should be kept in view in any alterations in the structure of these buildings.

The ablution-room belonging to the old barrack is in the back yard. It is a good room and sufficiently lighted. The table requires a bead, and pegs should be put up for hanging the men's clothes on while washing. One bath should be provided for this barrack.

A third ablution-room has been provided for the barrack sheds. It requires pegs and a form. Attached to this room is a water urinal on the principle of the one put up in Wellington barracks, and is stated to answer very well.

There are two cook-houses, one for the new barrack and one for the old barrack. The boiler accommodation is sufficient for the strength ; but there are no means of baking or roasting meat.

The cook-houses belonging to both barracks are tolerably good, but both require roasting ovens.

The latrines are drained down the side of the rock to the town sewers. They are of the ordinary form, and are simply washed out by the ablution-room water passing through them. They require reconstruction on Macfarlane's principle, with receptacles in which water will stand. They should have divisions of seats, half-doors, light, and ventilation.

The drains connected with the latrines ought all to be ventilated at a sufficient distance down the rock to prevent effluvia reaching the barracks, otherwise these long steep drains are apt to become ventilating shafts for the town sewers.

Urinals of a non-porous material, properly supplied with water for cleansing, should at the same time be substituted for those at present in use.

The Castle is abundantly supplied with water from the Edinburgh Water Company's works.

Some improvement in the ashpits and in the removal of barrack refuse is required.

There is so small an area available within the walls that it would be advisable, if possible, to provide for the daily removal of all ashes, dust, &c. in the same way as is done in Edinburgh. An iron cart might be placed in a convenient position for the purpose, or if this be not practicable, the ashpits should be provided with hoppers on Macfarlane's principle. It should be kept in view, however, that it is both the cleanliest and safest plan to remove all refuse as soon as possible out of circumscribed spaces where many men live together.

There is no proper laundry for the use of the garrison ; but only an ordinary women's wash-house in the basement of the new barracks. It has no suitable conveniences for washing, and should be provided with fixed tubs, and water laid on to them, and a proper drying stove.

There are two guard-rooms, one at the barrier and the other is the main guard. The latter is about to undergo alterations. The former requires ventilation through the roof, and a remodelled grate. The chimney of the officer's room is complained of on account of its smoking.

There is a good provost establishment of 12 cells, each of which gives upwards of 900 cubic feet per man. The cells are ventilated and warmed on Colonel Jebb's plan. There is an ashpit close to these cells which ought to be entirely removed.

The canteen is in the ground floor of the old palace, and occupies a large amount of space which might possibly be turned to better account.

The tap-room and non-commissioned officers' rooms are dark, and require ventilation by perforated glass panes in the windows.

Properly speaking, there are no married soldiers' quarters within the Castle, but a number of families are accommodated in the basement rooms of the "New Barracks." We have already stated our objections to these rooms on account of their unhealthiness, and we may further add that his Grace the Duke of Richmond, who takes great interest in the soldier's welfare, put into our hands a copy of a letter addressed by him, on the 1st December 1858, to the Assistant Adjutant General with reference to certain improvements required for the hospital, and along with it his grace gave us a paper containing notes, of which the following is a copy. We insert it here because it pointedly calls attention to the results of the want of proper married quarters in causing disease, to the want of proper hospital accommodation for soldiers' wives and children, and to the privations consequent thereon, after disease has arisen from defects in the married accommodation :—

"I beg to call the attention of the Commissioners to a copy of my letter to Viscount Melville, dated the 1st December 1858.

"The head-quarters of the city of Edinburgh Artillery Militia, and the head-quarters of the Royal Sussex Light Infantry Militia, are now in the Castle of Edinburgh.

"There is no room where the men's shirts, socks, &c., can be dried, and it is contrary to order that they should be dried in the sleeping-rooms. In the workhouses and prisons in England 'drying-rooms' are furnished.

"There are no available rooms to remove 'infectious' cases, either in the hospital or in the barracks.

"A case in point is submitted. In a married room, which contained three men, their wives, and four children, one child three weeks old was attacked by small-pox. I was obliged to hire lodgings for the men, their wives and children, in the town at my own expense. The mother of the child caught the small-pox ; and, since, one of the children.

"If married men and their families are to be permitted to be in barracks, surely there ought to be accommodation for them when attacked by an infectious disease.

"The medical officer cannot order medical comforts to the women and children. A soldier cannot support a wife unless she washes for the company. She is taken ill, or obliged to nurse her sick children, and her means of support are gone, and when sick she can only have such nourishment as is necessary for her recovery by the charity of the officers."

The latter of these contingencies will be obviated in future by the new hospital regulations, in all cases where hospital accommodation is provided for the sick of soldiers' families, but unless such provision can be made in Edinburgh Castle by an extension of the hospital, the evils pointed out by his grace will continue in operation as at present.

We have been informed that plans have been prepared for extending the buildings of Edinburgh Castle, and while we were there preparatory works of demolition had been commenced.

It appears to us to be of the utmost importance to consider these plans with reference to the sanitary defects and to the deficiency of accommodation we have pointed out.

Excluding for the present the barrack accommodation which has been destroyed to make room for a contemplated chapel school, and which has been temporarily supplied in the sheds of the expense magazine, the total accommodation in all the barrack rooms, some of which are not fit for permanent occupation, is only sufficient for 360 men instead of for 581 men, the number on the present construction.

The major question then appears to us to be that of providing a sufficiency of wholesome barrack accommodation for the number of men which, on military grounds, it may be considered necessary to keep in garrison, with a proper proportion of married quarters, either within or without the walls ; and this question we would specially recommend for consideration with reference to the proposed plans. As we shall presently show, the question likewise includes hospital accommodation. The sanitary improvement of the existing buildings would also be best considered at the same time, for it is possible that some of the requirements, as, for instance, the ventilation, might be carried out more economically when other works were being proceeded with.

*The Improvements requisite for the present Buildings are as follow :—*

1. Reduction of the number of inmates in all the barrack rooms to the extent shown in the preceding tables.

2. Ventilation and lighting of the staircases and corridors of the "new barrack," by gratings in the floors of the corridors, windows at the ends, louvres in the roof, and perforated glass panes.

3. Ventilation and warming of all the barrack rooms, school-rooms, serjeants' mess, and workshops, by shafts and remodelled grates ; barrack-rooms in the "new barracks" to be provided with inlets near the ceiling ; ventilation of the barrier guard-room, the fire-grates to be remodelled to warm the air and to prevent smoke ; canteen to have perforated glass panes in the windows.

4. Ablution-rooms to have beads to the tables, and pegs. One bath to be provided for the old barrack.

5. Cook-houses to be provided with means for baking and roasting meat.

6. Privies to be reconstructed as water latrines on Macfarlane's principle, with divisions of seats, half-doors, light, and ventilation. The drains leading from them to be ventilated. Improved urinals with water laid on to be provided.

7. Ashpits, if possible, to be entirely removed, and the barrack refuse to be taken away daily. Otherwise the ashpits to be covered and provided with hoppers. Ashpit near the provost cells to be entirely removed.

8. Women's wash-house to be provided with fixed tubs, and water laid on, and a drying and laundry stove.

*Edinburgh Castle Hospital.*

The garrison hospital forms the south side of the Palace square, and occupies the old Parliament House, which has been divided by floors, partitions, and stairs to afford the present accommodation, consisting of four wards affording regulation space for 62 beds, with from 660 to 704 cubic feet per bed.

The ground floor is occupied by the entrance hall and passage, out of which there is access by passages right and left to the principal medical officer's office, the surgery, nurse's room, pack store, kitchen, serjeants' quarters, and dead-house.

A good, roomy, light staircase gives access to the wards above, which occupy the two upper flats of the building.

The wards are all of the same dimensions,—namely, 33 feet long, 32 feet wide, and 10 feet high, and they have two and three windows on each of their opposite sides. Half of the windows open into the courtyard, and the other half open to the free atmosphere over the precipitous cliff on the edge of which the hospital is situated. The wards have the appearance of being low-roofed, because their height is too small for their other dimensions.

The following table shows the present accommoda-

tion in comparison with what it would be at 1,200 cubic feet per bed :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| B. 3 | 16 | 10 | 6 |
| A. 3 | 16 | 10 | 6 |
| A. 4 | 15 | 10 | 5 |
| B. 4 | 15 | 10 | 5 |
| Total - | 62 | 40 | 22 |

Each ward at a little less than 1,200 feet per bed would hold 9 beds. With 10 beds the space amounts to 1,056 cubic feet per bed. One entire face of the hospital is exposed to high winds, and as there are windows on opposite sides of the wards, each ward might, perhaps, accommodate 10 beds until additional space could be provided, but certainly no more.

There would thus be space for 40 beds, but more accommodation might be obtained by removing the recruiting duty out of the building.

At present there is no sleeping space for orderlies, except in the wards.

Some provision has been made for ventilation by hollow beams and by louvres in the windows, but it is not sufficient. A shaft is required besides. It should be carried up from one corner of each ward to above the roof. The existing hollow beam and louvres would then act as inlets.

The rooms are warmed by fire-grates or stoves. It would be advantageous in so exposed a situation to make arrangements for warming part of the air admitted in winter by remodelling the grates.

Until recently there was no fixed bath in the hospital, but in consequence of a representation from his Grace the Duke of Richmond, a proper bath has been fitted up in a room at the top of the stair. There is no ablution accommodation, but there is space in the bath-room for a few of Macfarlane's wash-hand basins, which would afford the required facilities.

There is no hospital laundry, and there is no space for one.

On account of a representation also made by his grace, an oven has recently been put up in the kitchen. As the kitchen is under a ward, it will be necessary to carry up a shaft, about a foot square, from the corner of the ceiling to above the roof.

The water supply is good and sufficient. There are good waterclosets out of the landing, with cross windows to insure ventilation.

This hospital is deficient in many important requirements.

It has no provision store. The pack store is insufficient. The bedding store is bad. There is neither exercising ground nor day-room for convalescents, who are hence confined to the sick wards all the time they are in hospital.

The kitchen is too small, and the orderlies have to clean knives, &c., in the dead-house, which is under the hospital, and not detached from it, as it ought to be. There is no accommodation for the sick of soldiers' families, especially for small-pox cases, which are of frequent occurrence in the overcrowded barracks where soldiers' families live.

The great difficulty is to find the requisite space for the accommodation required. It certainly cannot be supplied by the present building, which is not sufficiently large, even if the administrative offices were removed out of it, to accommodate properly the ordinary proportion of sick.

As already stated, we would strongly recommend that the question of hospital accommodation should be considered at the same time as the extension of the barrack accommodation with a view to their being properly balanced, to meet the requirements of the force of the garrison.

*In the meantime we would recommend that the following Improvements be carried out :—*

1. Reduction of the number of beds in each ward to ten.

2. Ventilation and warming of each ward by a shaft and remodelled grate. Ventilation of the kitchen by a shaft.

3. A Macfarlane's ablution-table to be placed in the bath-room.

### 2. Piershill Cavalry Barracks.

These barracks are situated about a mile to the east of Edinburgh and about a mile from the sea at Portobello. The site is naturally a low one when compared with the neighbouring ground, but there is sufficient fall for drainage. There is a small village contiguous to the boundary wall, but with this exception the situation is open, airy, and exposed to the sea breeze, a circumstance which tends materially to diminish or to counteract other disadvantages in the site presently to be noticed. There are several nuisances in the vicinity of the barracks which in our opinion might be easily abated or removed, and which we consider ought to be dealt with summarily.

The worst of these is a small gas-work belonging to the North British Railway, close to the boundary wall. The nuisance from this source is not greater than usually proceeds from gas-works, but as it is quite possible to conduct the manufacture of gas without injury to anyone, the proprietors ought to be compelled to do so.

Extending from the barracks towards the sea there are between 200 and 300 acres of meadow land under irrigation from the sewage of the old town of Edinburgh. There has been complaint of nuisance from these meadows from time to time, but as the property is a very valuable one, letting from 20*l.* to 30*l.* per acre per annum, any interference with it has been successfully resisted. These complaints have given rise to several inquiries into the source of the nuisance, and they were dealt with by a Royal Commission, appointed in January 1857, to report on the whole subject of the application of town sewage to economical purposes.

The following extract from the preliminary report of that commission gives the result of their examination into this special case :—

"There is one circumstance, however, in the case of the Edinburgh meadows which is invariably brought forward as an objection by the opponents of sewage manure, namely, that they give rise to constant complaints, not only from persons living in the immediate neighbourhood, but from inhabitants of some parts of Edinburgh itself at a distance of two miles. There can be no doubt that in their actual condition they would be a source of nuisance, especially in hot weather; but we feel satisfied from inspection that this evil is not a necessary concomitant of sewage application, even in the large quantities employed at Edinburgh, but that it arises from the existence of open ditches which convey the sewage, and on whose banks solid offensive matter is deposited and exposed to the air. The absorption of the offensive gases of sewage by the soil and by vegetation is so rapid that there is no perceptible smell from meadows after irrigation, and it is manifest that if closed drains or pipes were substituted for open ditches the inhabitants of Edinburgh would cease to have cause to complain of this employment of the sewage."

We [illegible] these meadows in the vicinity of Piershill barracks, and we [illegible] that the [illegible] from the [illegible] there [illegible] nuisance [illegible] from the occupation of the meadows, [illegible] serious [illegible] of removal.

The [illegible] immediately outside the [illegible] boundary is occupied by large open [illegible] receiving deposits which, at an ordinary

temperatures, give off offensive emanations. These sewers could all be arched over without in any way interfering with the irrigation, and were this done most of the nuisance would disappear.

We were informed that the lessee or proprietor had expressed his willingness to do everything in his power to remove any cause of complaint; and we would recommend that he be requested to cover over the main watercourses to a sufficient distance from the barrack to prevent nuisance from them reaching the barracks.

At the same time we must express our opinion that barracks should not, if possible, be placed in such situations. Their healthiness or unhealthiness depends on too many contingencies as to temperature, moisture, &c. to render their occupation desirable.

In regard to the barrack itself, it is situated within a rectangular enclosure eight acres in area, fronting the public road between Edinburgh and Portobello. The buildings are in three ranges, enclosing a parade ground. The centre range contains officers' quarters, with men's quarters at the ends, and the two side ranges have men's quarters. The buildings are in two floors. The stables are below, and the men's rooms are on the floor above.

Behind the men's ranges are the riding school, workshops, hospital, &c., and on the side fronting the public road are the gates, guard-room, cells, &c.

The total accommodation is for 354 non-commissioned officers and men.

The men's accommodation consists of 37 eight-men rooms, all of a size. They are 27 feet long, 16 feet broad, and 9 feet high, and are arranged in the usual manner of cavalry barracks, namely, along two sides of a central passage or corridor extending from end to end of the block, and these corridors are reached by good stone stairs between the stables. The average space per man is 485 cubic feet. The following table shows the total present regulation accommodation, and what the accommodation would be at as nearly as possible 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 37 | 296 | 259 | 37 |

As already mentioned, the present number of men per room is eight. If six were allotted to each the amount of space, although above 600 cubic feet per man, would not be greater than it already is in certain cavalry barracks. If the number of men per room were reduced to seven the amount of space would be under 600 cubic feet. We should prefer in this barrack, were it practicable, that the numbers of men per room were fixed at six instead of seven; but in the preceding table we have adopted seven men as the maximum nearest that required by our instructions.

The corridor leading to the barrack-rooms has been sufficiently lighted and ventilated by three ventilating shafts, with lights over them, carried up from the ceiling through the roof. These shafts resemble those we have recommended for other cavalry barracks.

The men's rooms have the doors close to the fireplace, which is a defective arrangement wherever it exists, because it makes the fireside uncomfortable, and prevents the due ventilation of the opposite end of the room. In this and in all similar cases we would advise the removal of the door to the end of the room opposite the fire.

The rooms have openings in the ceiling, said to be connected with air shafts carried through the roof. Hence it will only be necessary to complete the ventilating arrangements by providing one inlet of the usual form in the outer wall of each room close to the ceiling. The fire-grates should at the same time be remodelled to warm part of the air admitted in winter.

All the rooms have too little window space. They have each one window 4 feet high by 9 feet wide near the fire-place, an arrangement which leaves a large part of the room in comparative darkness. To remedy this we would recommend an additional window to be opened in each room at the end farthest from the fire-place. It would also improve the ventilation of the whole building if the windows between the rooms and passages were made to slide, and if perforated glass panes were put into them.

The stables being under men's rooms should be ventilated by shafts carried from the corners above the roof. They have inlets at present. The pavement in some of the stables is far from being good.

There are some temporary stables which might be materially improved by increasing their ventilation through the roof. There are no litter sheds.

Each of the serjeants' rooms requires an Arnott's silk flap ventilator in the chimney.

The serjeants' mess and the library should be ventilated like the barrack-rooms.

The school-room has two fire-places, one of which should be closed, and the chimney shaft converted into a foul-air shaft by an opening double its sectional area being made into it close to the ceiling. It also requires two inlets for fresh air, and a remodelled grate of the usual form. This school-room is stated to be much too small for the requirements of the barracks.

There are projecting buildings behind the entrance passages, in which are placed the ablution-rooms and cook-houses. There are two ablution-rooms, with benches, &c., and in one of them a bath with hot and cold water had been recently put up. There were no ledges to the tables, and no pegs, and no forms at the time we were there, but the improvements in the rooms were not completed. Ledges, pegs, and forms should be provided if they have not been so already. Three baths would be required for the strength in barracks.

The cook-houses have boilers of the usual form, and a brick oven for baking the dinners had just been put up in one of them.

The women's wash-house is too dark, and it has not sufficient ventilation. It requires a skylight and louvre, and it should be properly fitted up with fixed tubs having water laid on. It should have a laundry and drying stove.

Some new workshops have been recently erected, but like others in the barrack they require to be ventilated. We would propose to effect this by placing Arnott's ventilators in all the chimneys, and perforated panes in the windows.

There are four latrines, drained and trapped, but one set only were provided with proper water receptacles on Macfarlane's principle. These water latrines should be introduced in every case; all the latrine buildings should be properly lighted and ventilated, and, whenever practicable, divisions, with half-doors, should be put up.

There are slate urinals, but they are not of very good construction, and are difficult to keep clean.

The ashpits and manure heaps are excavated instead of being above the level of the ground. In so open a situation it is not necessary to provide iron carts, but both sets of receptacles should be filled up a little above the level of the ground. They should be paved and drained, and the ashpits should be covered and provided with hoppers on Macfarlane's principle.

A sufficient water supply is provided from a reservoir on Arthur's Seat, and all the drains are stated to be trapped. The stable drainage is, however, defective, and requires improvement.

The riding school is rather dark and would be

improved by additional light and ventilation through the roof.

The canteen accommodation is not sufficient, as there is no proper dwelling house for the tenant. An Arnott's ventilator and perforated panes are required for the tap-room.

There are 22 sleeping rooms for non-commissioned officers, but there is no accommodation for married soldiers. None of these rooms are ventilated.

There is no chapel.

The guard-room is very small for the number of men. It requires ventilation by a shaft through the roof and a remodelled grate. Additional ventilation should also be given to the lock-up by an opening through the roof.

*The following is a Summary of the Sanitary Improvements required for Piershill Barracks:—*

1. Steps to be taken for having the open sewers in the vicinity of the barracks covered, and the nuisance from the gasworks abated.

2. Reducing the regulation number of men from 8 to 7 per room.

3. Completing the lighting, ventilation, and warming of the men's rooms by opening an additional window to the external air in each room, and making the windows into the passages to open by sliding.

Providing an inlet for fresh air through the outer wall of each room close to the ceiling, and remodelling the fire-grates to warm part of the admitted air in winter. The room doors to be moved to the end farthest from the fire.

All the non-commissioned officers' rooms to be provided with Arnott's valves into the chimneys.

The serjeant's mess and the library to be ventilated by shafts and inlets.

The school-room to be ventilated by converting one of the chimney flues into a ventilating shaft, as suggested, and by two inlets for air and a remodelled grate.

The new workshops and the canteen tap-room to be ventilated by Arnott's ventilators and perforated panes.

Guard-room and lock-up to be ventilated through the roof. Guard-room to have a remodelled grate.

4. Stables to have shafts carried from the corners the ceiling above the roof. Their surface drainage to be improved. Temporary stables to have additional ventilation through the roof. Riding school to have sufficient light and ventilation through the roof.

5. Ablution tables to have ledges. Pegs and forms to be put in the ablution-rooms, and the number of baths to be increased to three.

6. Women's wash-house to be provided with fixed tubs and water laid on, also with a laundry and drying stove, and to have light and ventilation through the roof.

7. All the latrines to be reconstructed on Macfarlane's principle; if practicable, with larger divisions of seats and half-doors. The buildings to be suitably lighted and ventilated.

8. Ashpits and manure heaps to be filled up above the level, and to be paved and drained. Ashpits to be covered and provided with hoppers.

### *Piershill Barrack Hospital.*

This hospital is situated on the east side of the barrack enclosure, and has a small court-yard behind. It is two stories high, and contains on the ground floor the surgery, bath-room, and kitchen on one side of the entrance, and a ward on the other side. On the upper flat is a ward the same size as the one below, and over the kitchen and bath-room are two small wards. The total regulation accommodation is for 32 beds, 28 of which have 701 cubic feet per bed. The following table shows the accommodation:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 14 | 8 | 6 |
| 2 | 14 | 8 | 6 |
| 3 | 2 | 1 | 1 |
| 4 | 2 | 1 | 1 |
| Total - | 32 | 18 | 14 |

In the two larger wards the amount of space we have allotted for the eight beds in the table is 1,227 cubic feet per bed, but in case of emergency nine beds instead of eight might be accommodated. This would give about 1,100 cubic feet per bed. The two smaller wards ought not to have more than one bed in each.

The larger wards have inlets for air near the ceiling, four on each side, and they have three windows on each side. They have two fire-places, the chimney of one of which might be made to serve as an outlet foul-air shaft, by having an opening double its sectional area made into it close to the ceiling; the fire-place below should at the same time be bricked up. The other fire-grate should be remodelled to warm the air admitted. The fire-place selected for this latter purpose should be the one in the outer end wall.

The two small wards could be sufficiently ventilated by Arnott's valves in the chimneys, and an inlet close to the ceiling like those in the other wards.

Ventilation is required for the staircase and passages, and should be effected by a shaft through the roof from the top of the staircase, and perforated panes in the upper row of the windows.

The kitchen should be ventilated by a shaft nine inches square carried from its ceiling above the roof, and perforated glass panes in the windows.

The ward over the kitchen is subdivided by a partition, which should be removed, and a shaft, inlet and remodelled grate provided.

A new ablution and bath room were being constructed behind the hospital, but there was no covered communication between them and the hospital. A covered corridor should be provided. There was no bead on the ablution table.

There are waterclosets for the sick in a projection built out from the half-landing which require reconstruction. They are not sufficiently ventilated, and should have windows on each side, and a shaft through the roof.

There is a privy in the yard behind, recently constructed on Macfarlane's plan, but it requires ventilation.

The hospital wash-house also requires ventilation. It should have fixed tubs, with water laid on, and some means of drying. The dead-house is used as a foul linen store.

The pack store, which is in the yard, has no racks.

In the yard there is a covered ashpit, but the bottom is sunk below the level of the surface. It should be filled up above the level, paved, and drained.

There are no orderlies' rooms, and no accommodation for the sick of soldiers' families.

*The Sanitary Improvements required for Piershill Barrack Hospital are:—*

1. Reducing the number of inmates in the wards as stated above.

2. Completing the ventilation and warming of the larger wards by converting one of the chimney flues into a ventilating shaft and remodelling the fire-grate in the other fire-place (the one in the outer wall). Removing the partition in the ward above the kitchen, and ventilating the ward by a shaft, inlet, and remodelled grate; ventilating the small ward by an Arnott's valve and an inlet; ventilating the waterclosets by windows on opposite sides and a

shaft through the roof; ventilating the kitchen by a shaft through the ceiling and roof, and by perforated glass panes; ventilating the staircase and passages by a shaft and perforated glass panes.

3. Improving the construction of the waterclosets, and ventilating the latrines in the yard.

4. Providing a covered connexion between the new ablution and bath room and the hospital; providing a bead for the ablution table.

5. Hospital wash-house to have fixed tubs and means of drying.

6. Pack store to have racks provided.

### 3. Leith Fort.

Leith Fort consists of a long parallelogram of ground, seven acres in area, situated on the sea-shore between Leith and Newhaven, about two miles from Edinburgh.

The buildings consist of officers' quarters, men's barracks, stables, gun sheds, &c., arranged in the form of a square at the end of the ground furthest from the sea, and 15 to 20 feet above high-water mark. The position is quite open and exposed to the sea breeze. There are ample facilities for drainage, and the fort ought to be healthy.

One important part of the construction of these barracks is the separation of the stables from the men's rooms.

The men's rooms occupy a range of two-story buildings facing the entrance gate on the land side, and the stables are nearly at right angles to them, and have forage stores over the horses. The officers' quarters are behind the men's range, and further back is the hospital.

In arranging the barrack-rooms the ordinary plan of cavalry barracks has been adopted. There is an internal corridor or passage running from end to end of each floor, out of which the men's rooms enter right and left, with windows on one side only. The rooms are of two heights, namely, 9 feet 6 inches and 9 feet 8 inches; and they are of two breadths, namely, 15 feet and 17 feet 1 inch, but they vary in length from 12 feet 8 inches to 45 feet, giving the rooms an appearance of irregularity in plan. The number of windows varies from one to four per room according to the length.

Each room has one fire-place.

There are 22 barrack-rooms with regulation accommodation for 248 men, at from 326 to about 480 cubic feet per man. The following table gives the details for each room :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 19 | 11 | 8 |
| 2 | 20 | 12 | 8 |
| 3 | 10 | 6 | 4 |
| 4 | 11 | 7 | 4 |
| 6 | 5 | 4 | 1 |
| 7 | 5 | 4 | 1 |
| 9 | 9 | 4 | 5 |
| 10 | 9 | 6 | 3 |
| 11 | 14 | 9 | 5 |
| 13 | 19 | 10 | 9 |
| 15 | 20 | 12 | 8 |
| 16 | 11 | 6 | 5 |
| 17 | 5 | 4 | 1 |
| 18 | 12 | 7 | 5 |
| 19 | 4 | 4 | 0 |
| 20 | 5 | 4 | 1 |
| 21 | 13 | 8 | 5 |
| 22 | 5 | 4 | 1 |
| 23 | 14 | 9 | 5 |
| 24 | 11 | 6 | 5 |
| 25 | 15 | 9 | 6 |
| 26 | 12 | 8 | 4 |
| Total | 248 | 154 | 94 |

As there is no serjeant's mess-room in the barrack, one men's room is used for the purpose, but there is no mess kitchen. Another room is used as a tailor's shop, so that, although on the construction, these rooms are not available for diminishing the overcrowding shown in this table. The school-room is also a barrack-room.

Hardly one of the rooms is exactly divisible into equal spaces of 600 cubic feet, but the table shows as nearly as may be what the accommodation at that rate is in each room of the barracks. We should not advise the numbers to be increased in the rooms beyond those we have given, on account of the defective structure of the barrack-rooms, which to a certain extent neutralizes the advantages of the situation.

The barrack as a whole is not an unhealthy one, but a considerable amount of sickness, especially from zymotic diseases, might, in all probability, be prevented by improving its structure as far as practicable.

From the return made to us, it appears that nearly 30 per cent. of the admissions to hospital have been from zymotic diseases, and out of five deaths occurring at Leith Fort during the last five years, two were from fever and one from pulmonary consumption.

The structure of the rooms is such that the beds are only 10 inches apart at the sides, and about 20 inches from foot to foot. In some of the rooms the beds, when folded down, appear to cover nearly the whole floor. Equal in importance to reducing the number of inmates in the rooms, is providing more light and sufficient ventilation throughout the buildings. The corridors are dark and have no means of renewing the air sufficiently at present. To remedy this we would propose to carry up from the ceiling of the upper corridor a sufficient number of large shafts with skylights over them to light these passages, and large gratings should be placed in the floor of the upper corridor under the skylights to allow light to enter the ground-floor corridor. The skylights should also be so arranged as to ventilate both upper and lower corridors effectually. In one locality the communication between the staircase and corridor has been cut off by a wall, which ought, if possible, to be removed, or, if not, large openings should be made in it to allow the air to circulate. Perforated glass panes should also be placed in all the windows opening into the passages or stairs.

Some of the men's rooms are very deficient in light. In all such cases an additional window should be opened.

None of the rooms are ventilated. They all require shafts, inlets, and remodelled grates. The latter are an essential part of the ventilation in this barrack on account of its exposed position.

The ablution room is situated in a down-stairs room in immediate contiguity with men's dormitories, and is complained of with justice on account of the dampness it occasions in the adjoining rooms. It ought to be removed. There is little enough space for men in the building without encroaching on it, especially by conveniences which increase damp in the building. The ablution accommodation is, moreover, much too limited.

There is plenty of space for erecting an ablution and bath room connected with the range, but not under the same roof. This should be done, and two baths with water laid on should be provided in it.

A similar remark applies to the kitchens.

There are two of them also on the ground floor among the men's rooms, but as there is no women's wash-house, one of the kitchens is used for the purpose.

Both should be removed and built outside, and the space obtained by placing the ablution-room, kitchen, and wash-house in a more healthy position might, by a little re-arrangement, be added to the deficient barrack-room accommodation.

Until these additions can be made to the buildings,

the kitchen, women's wash-house, and lavatory should have shafts carried from their ceilings above the roof, and perforated glass panes in the windows.

The present ablution-room should have a bead put to the table and gratings, and pegs should be provided.

An oven has recently been erected in the kitchen.

An abundant and excellent water supply is obtained by contract from the Edinburgh Water Company.

There appears to be some defect in the barrack drainage where it passes the hospital, for unpleasant effluvia are at times complained of, although all the drains are said to be trapped.

The drainage should be carefully examined for the discovery and removal of this defect.

There are two sets of latrines on Macfarlane's principle, but the divisions between the seats are not large enough, and there are no half-doors. In all future applications of these latrines proper divisions with half-doors should be provided. The buildings themselves are quite dark, so that it is impossible to ascertain in what condition the latrines are at any given time. They should be well lighted as well as ventilated through the roof. The urinals are supplied with water for cleansing.

There is a good guard-room, but it has no ventilation. It should have a shaft and louvre through the roof, and a remodelled grate.

The stables are ventilated through the roof, but some temporary stables are very dark.

There are no litter sheds.

The canteen, which is behind the stables, is quite insufficient for the barrack. It requires ventilation by a shaft through the roof and perforated glass panes.

The collar maker's shop, also in the rear of the stables, is too dark, and requires a skylight and roof ventilation.

These barracks are old and require constant repairs, and they are deficient in some requirements, such as day-rooms, married quarters, &c.

*The Sanitary Improvements required are as follow:—*

1. Reduction of the number of men to the extent shown in the table.

2. Ventilation and lighting of the passages by ventilating skylights over shafts in the upper passages and gratings in the floor below. Perforated glass panes to be put into the stairs and passage windows; wall obstructing the ventilation referred to, to be removed or perforated.

3. Dark barrack-rooms to have additional windows. All the barrack-rooms to be ventilated and warmed by shafts, inlets, and remodelled grates. School-room and serjeant's mess to be similarly ventilated. Guard-room to be ventilated by a shaft and remodelled grate. Canteen to be ventilated by shaft and perforated panes of glass. Collar maker's shop to be ventilated and lighted through the roof.

4. Present ablution-room, cook-house, and women's wash-house to be ventilated by shafts and perforated glass panes. Ablution-room to have a bead to the table, and gratings and pegs.

5. Ablution-room, women's wash-house, and kitchens to be removed and reconstructed outside the barrack range. Two baths to be provided for the new ablution-room, and fixed tubs, with water laid on; gratings and a drying and laundry stove to be provided in the new wash-house.

6. Drainage to be examined, and the defect near the hospital remedied.

Latrines to have larger divisions between the seats and half-doors. The latrine buildings to be lighted and ventilated through the roof.

7. Litter sheds to be provided for the stables.

*Leith Fort Hospital.*

This hospital consists of two separate blocks, connected by a covered verandah, suitable as an exercising place for convalescents.

One of the blocks is old, the other is of more recent construction. The old block has a kitchen, surgery, and steward's room on the ground floor, with three wards above.

In the other building are two wards one over the other.

There are six wards on the construction, one of which on the ground floor (No. 1) is unfit for sick. It has only one window, which is obstructed by a wall, and it has no proper means of ventilation.

This ward was formerly a nurse's room. It then was used as a ward. It is now a nurse's room, and should be struck off the construction as a ward altogether.

The itch ward, which is in the attic, has no fire-place, and is not fit for its purpose, but it only contains one bed, and is not likely to be much used.

There are thus only four wards out of six suitable for sick, and these are considerably overcrowded, as will be seen from the following table of the accommodation:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 3 | Not fit for sick | 3 |
| 2 | 6 | 3 | 3 |
| 3 | 6 | 3 | 3 |
| 4 | 8 | 5 | 3 |
| 5 | 8 | 5 | 3 |
| 6 | 1 | 1 | — |
| Total - | 32 | 17 | 15 |

The total accommodation on the construction is 32 beds. Three beds in No. 1 should, at all events, be struck off, and allowing as nearly as may be 1,200 cubic feet per bed, there is space for 17 beds in the two buildings.

The ventilation of all the wards requires improvement. Wards 2 and 3 have no ventilation. One ward has two fire-places. One of these could easily be made into a foul-air shaft by closing up the fire-place below, and making an opening into the shaft close to the ceiling, double the sectional area of the shaft. Wards 2 and 3 would require an inlet each close to the ceiling.

Wards 4 and 5 are provided with Sherringham's ventilators. They have also cold air inlets at the floor. These latter should be closed, as cold air should never be allowed to enter a ward at the floor. These wards have openings in the ceilings, but no shafts. In all the wards where there is not a second flue to serve as a shaft in the way mentioned, a shaft should be carried from the ceiling to above the roof.

All the fire-grates should be remodelled to warm part of the admitted air.

There is neither lavatory nor bath for the sick.

It will be requisite to provide a room with one bath supplied with hot and cold water, and a Macfarlane's ablution table. It should have a covered connexion with the hospital.

There is no hospital wash-house. The kitchen is the place where both patients and linen are washed.

This kitchen is under a sick ward. It is sufficiently supplied with means of cooking diets, but it requires a shaft carried up from its ceiling through the roof to convey away the fumes, and also perforated glass panes in the upper row of the windows.

There are two waterclosets, both of which are defective in ventilation. They each require a shaft nine inches square carried from the ceiling up through the roof, and inlets for air near the ceiling.

In the hospital yard is a Macfarlane's water latrine, but the building is quite dark, and requires light and ventilation through the roof.

Close to the hospital is an ash-pit, which has been a frequent cause of complaint. It ought to be removed entirely.

There is neither provision nor pack store, and there is no space for treating the sick of married soldiers' families.

*The following Improvements are required for this Hospital :—*

1. Ward No. 1 to be struck off the construction, and three beds each to be removed out of wards 2, 3, 4, and 5.

2. Wards 2 and 3 to be provided with foul-air shafts, inlets, and remodelled grates. Wards 4 and 5 to be provided with foul-air shafts and remodelled grates, and the floor ventilators to be closed. Staircases to be ventilated through the roof.

3. A lavatory and bath-room, with bath, ablution table, with sunk basins, and hot and cold water, to be provided and connected with the hospital.

4. A hospital wash-house, with means of washing and drying linen, to be provided, detached from the hospital.

5. Kitchen to be ventilated by a shaft nine inches square, carried above the roof, and by perforated glass panes in the window.

6. Water-closets to be ventilated by shafts and inlets. Latrine in the yard to be properly lighted and ventilated.

7. The ash-pit near the hospital to be removed.

## II. BERWICK-ON-TWEED.

### Infantry Barracks.

These barracks are situated on the eastern side of the town, on elevated ground overlooking the sea. They are near to one of the town gates, and the ramparts rise close to their boundary wall. Part of the buildings of the town adjoin the wall on one side, but the site is elevated and open, and it ought to be healthy.

The barrack-rooms are arranged in two opposite blocks of stone buildings, three stories in height, forming two sides of a small square. The gate forms the third side, and the fourth side is completed by a range of old buildings partly used as cells, stores, &c. Behind each soldiers' range is a very narrow, ill-paved, and badly drained yard.

The buildings are very old and much dilapidated. The floors and ceilings are in a bad condition, the former having dry rot in some places. One outbuilding has to be supported by struts to prevent the walls falling outwards.

There are 72 barrack-rooms in the several men's houses, arranged back to back, four on a flat, with a staircase and passage running from front to back of each house. The rooms are all of a size. They are 20 feet long, 17 feet 3 inches broad, and only 8 feet 3 inches high. They have each two small windows, which open by sliding, and there are openings through the partition wall dividing every two adjoining rooms.

The total accommodation is for 720 men with only 284 cubic feet per man. The details of this excessive overcrowding are given in the following table :—

| Rooms and Houses. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| A. 12 Rooms | 120 | 60 | 60 |
| B. 12 „ | 120 | 60 | 60 |
| C. 12 „ | 120 | 60 | 60 |
| D. 12 „ | 120 | 60 | 60 |
| E. 12 „ | 120 | 60 | 60 |
| F. 12 „ | 120 | 60 | 60 |
| Total - | 720 | 360 | 360 |

These barracks will hold five men per room (360 in all) with considerably less than 600 cubic feet per man ; but to enable this to be done not only must the requisite sanitary improvements be carried out, but the whole establishment must be put into a thorough state of repair. At present it is unfit for occupation on account of its bad condition.

One great and irremediable defect in the barrack-rooms is their low ceilings, which are at least two feet lower than they ought to be.

No part of the buildings is ventilated. Each staircase requires a shaft carried up from the ceiling above the roof, and panes of perforated glass in the windows.

Each barrack-room requires a shaft to be carried from the ceiling to above the roof. An inlet for air should also be made through the outer wall, and provision should be made for warming part of the air admitted in winter, by removing the present old pattern grates, and replacing them by remodelled grates. When the barrack-rooms are properly ventilated the openings in the partition walls between the rooms should be permanently closed.

There are gas-burners in all the barrack-rooms.

There is no school-room, except two soldiers' rooms which have been misappropriated for the purpose. These rooms require ventilation by shafts, inlets, and remodelled grates, like the other barrack-rooms.

It is proposed to appropriate part of the large building opposite the gate for a school-room. There would be space enough for the purpose. The room would require roof ventilation.

The guard-room has no ventilation, and the passage leading to the cells is also unventilated. It should have an opening over the door, and perforated glass panes in the end window.

There is neither ablution-room, baths, nor laundry. There is a place used as a women's wash-house outside the barracks, but it is destitute of every convenience for washing and drying linen.

There are two cook-houses, with six boilers in each, but without ovens. They are not in a good state, and require reconstruction.

The ash-pits are much too close to the men's rooms. They ought to be removed entirely and reconstructed in a better situation, or provision should be made for the daily removal of the barrack refuse.

There are two underground cleaning-rooms, but being dark and damp they are never used.

The tailors' shop is also very dark, and is consequently seldom used. It requires light and ventilation through the roof.

The drainage and sewerage is not in good condition, and requires to be repaired.

There is a sufficient water supply from the town works, and also from a spring outside the ramparts.

The present privies should be reconstructed with Macfarlane's water latrines, and should have divisions of seats, half-doors, light, and ventilation.

There is no accommodation for married non-commissioned officers nor soldiers.

Several soldiers' rooms are misappropriated for objects for which accommodation is required.

We have indicated above the chief defects and deficiencies of these barracks. We would strongly recommend, if the barracks are to be retained for service, that they be put into a complete state of repair, and the deficiencies in accommodation supplied as far as the space will admit ; and while carrying on the repairs, the following sanitary improvements should be executed, but without the repairs they would be of little use :—

1. To reduce the number of men on the construction of each room from 10 to a maximum of five men per room.

2. To ventilate each room by a shaft, inlet, and remodelled grate, and to close up the openings between the rooms. To ventilate the staircases and passages by shafts from the ceilings, and perforated panes. Guard-room to be ventilated by a shaft and remodelled grate. Passage leading to the lock-up

cells to have an opening over the door and perforated glass panes in the window at the end.

3. Ablution-room and bath-room, with three baths and water laid on, to be provided.

4. A suitable laundry with fixed tubs, and water laid on, and a drying and laundry stove, to be provided.

5. Cook-houses to be reconstructed and supplied with ovens.

6. Ash-pits to be removed from their present position, and reconstructed at a greater distance from the barrack-rooms.

7. Tailors' shop to be lighted and ventilated.

8. Privies to be reconstructed on Macfarlane's principle.

*Berwick-on-Tweed Hospital.*

The hospital is in keeping with the barracks. It is a small building resembling a cottage house, situated in a narrow lane at a short distance from the barracks, with a small enclosed yard in front, the surface drainage of which is in a bad condition. The hospital consists of a central staircase and passage, out of which the wards and offices enter right and left.

There are six wards with regulation space for 40 beds with from 462 to 525 cubic feet per bed.

On the ground floor is a nurse's room, serjeants' room, store-room, and kitchen, with a ward built out behind, next door to the kitchen. It is a miserable place for sick. There is another ward somewhat better over it. Over the offices are too small wards, with small windows, quite unfit for sick in their present state, and between these wards is the water-closet, which is imperfectly ventilated. On the upper flat are too very inferior attics.

The following table shows the amount of accommodation in each ward :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 9 | 4 | 5 |
| 3 | 9 | 4 | 5 |
| 4 | 7 | 3 | 4 |
| 5 | 7 | 3 | 4 |
| 6 | 4 | 2 | 2 |
| 7 | 4 | 2 | 2 |
| Total - | 40 | 18 | 22 |

These wards would hold 18 sick, if they were in sufficiently good sanitary condition. But the average cubic space would have to be 1,200 cubic feet to enable this to be done.

A slight provision for ventilation has been made by openings in the ceilings of the wards, but it is of little or no use.

The whole building requires to be ventilated and warmed, which we would propose to effect as follows :—The staircase should have a shaft carried from its ceiling to above the roof, and perforated panes should be inserted in the windows. All the windows throughout the building should be made to open at top. Each ward should have a shaft, inlet, and remodelled grate. The kitchen requires a shaft from its ceiling to be carried above the roof, and perforated glass panes to be put into the window.

In all the wards the windows are too small. The largest window is only six feet three inches high, and three feet five inches wide, and there are two wards in which the windows are only four feet high and two feet four inches wide. Were it practicable all the wards should have increased window space.

There are two water-closets within the hospital. They should have shafts carried above the roof and perforated glass panes in the windows.

The kitchen has a grate and boiler but no oven. A proper range with an oven should be provided.

There is no ablution accommodation for the sick, and no bath.

The hospital wash-house requires reconstruction.

Similar remarks apply to this building as to the barracks. If the barrack establishment is to be retained, the hospital must be put into a state of thorough repair, and in doing so the following sanitary improvements should be carried out :—

1. The number of beds in all the wards to be reduced to the number given in the preceding table.

2. Ward windows to be enlarged and sashes to open at top. Staircase to be ventilated by a shaft through the ceiling, and perforated glass panes in the windows. Wards to be ventilated by shafts, inlets, and remodelled grates. Water-closets to be ventilated by shafts and perforated glass panes.

3. Kitchens to be ventilated by a shaft and perforated glass panes, and to be provided with a suitable range and oven.

4. An ablution-room and bath to be provided, and hot and cold water laid on to them.

5. Hospital wash-house to be reconstructed.

## III. STIRLING CASTLE.

Stirling castle is situated on the summit of a rock of basalt about 800 yards distant from the river Forth and about 260 feet above its level. The buildings overlook the whole surrounding country. They are freely exposed to the winds, and occupy a remarkably healthy position.

Properly speaking there are no barracks within the castle more than would accommodate a small guard. The chief structures are the ancient Palace and Parliament House, both of which are used for accommodating soldiers.

The palace was built in 1529, and was converted into a barrack in 1745. The parliament house dates from 1460, and was converted into a barrack in 1801.

The original character of these national buildings has been completely lost sight of in the clumsy alterations which have been made in them, without any corresponding benefit to the soldier, at least in so far as regards the palace barrack, the rooms of which are amongst the worst barrack-rooms we have seen anywhere.

There are in all 20 barrack-rooms in the castle, four of which have been taken off the construction for a library, serjeants' mess-room, and quarter-master's stores.

The remaining 16 rooms have regulation space for 484 men, divided as follows :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Parliament House. | | | |
| 1 | 26 | 22 | 4 |
| 2 | 18 | 16 | 2 |
| 3 | 27 | 22 | 5 |
| 4 | 22 | 16 | 6 |
| 5 | 27 | 27 | — |
| 6 | 22 | 19 | 3 |
| 9 | 22 | 16 | 6 |
| 10 | 28 | 25 | 3 |
| 11 | 22 | 20 | 2 |
| 12 | 24 | 21 | 3 |
| Palace. | | | |
| 13 | 40 | 28 | 12 |
| 14 } | 63 | 54 | 9 |
| 15 } | | | |
| 16 | 46 | 31 | 15 |
| 17 | 48 | 38 | 10 |
| 18 | 49 | 36 | 13 |
| Total - | 484 | 391 | 93 |

If all the barrack-rooms in Stirling castle were suitable for occupation they would hold 391 men at as nearly as may be 600 cubic feet per man. But they differ considerably in their structure. The old parliament house has been cut up by staircases, floors, and partitions, so as to make three flats of tolerably good rooms, varying from 11 feet 9 to 14 feet high in the upper rooms, which are carried into the roof. There is a considerable amount of window space on opposite sides, apparently on account of the large size of the old windows. All the rooms except two have stoves instead of fireplaces.

They have no special means of ventilation, and being without chimney flues they are dependent solely on the doors and windows for renewing the air. There are some openings over the doors into the staircases, but the staircases themselves are not ventilated.

The ventilation of this barrack should be carried out on the usual system, except that the inlets for fresh air could not easily be constructed in the external walls.

We would propose, first, to ventilate the staircases thoroughly by a louvre carried up through the roof from their ceilings and by perforated glass panes in the windows.

We should propose, in the second place, to provide inlets by placing louvre boards over openings above the doors, slanted so as to turn the inflowing current up to the ceiling ; and lastly, a shaft should be carried up from the corner of each room to above the roof.

It would be an improvement in the warming of these rooms to introduce Cundy's stoves instead of the present ones.

All the rooms are supplied with gas.

Two of the lower rooms are flagged instead of being boarded. We consider the boarding of these floors as necessary for health, and would recommend its being done, as has been proposed in the estimates.

There are serjeants' rooms partitioned off from the landings on the two upper floors. These rooms require perforated panes in the windows for ventilation.

The serjeants' mess is on the ground floor. It has no mess kitchen. It would be desirable to restore this room to the construction of the barracks, and to find mess accommodation elsewhere.

The barrack accommodation in the palace is of a very inferior character. The old halls of the building have been crowded with men not only on the floors but on galleries carried round the walls, exhibiting one of the worst barrack arrangements in the three kingdoms.

The men's heads in the upper tiers of beds are above the tops of the windows, and the galleries have neither sufficient light nor ventilation. The only result is damage to an interesting national structure, and the crowding of a number of men within a building incapable from its construction of making a proper barrack.

These galleries should be removed, and were this done the rooms would accommodate half their present inmates, and they would be sufficiently ventilated by glass louvres in the upper row of window panes. The men would have a much larger cubic space than would be requisite in properly built barracks, but this is inevitable.

One or two of the larger rooms in the palace have been subdivided by partitions into serjeants' quarters. They are not very good, but may be improved by inserting a pane of perforated glass into the top row of each window.

There is a chapel school under the armoury ; it has ventilation at different parts near the ceiling.

There are two ablution-rooms, one under the parliament house, the other under the quartermaster's store. It would improve these and similarly arranged ablution-rooms to make the back walls of slate, instead of brick, which soon becomes saturated with water, and is an unavoidable source of damp. One of these ablution-rooms is supplied with Macfarlane's foot-pans and a bath.

The bathing accommodation is not sufficient. Four baths in all would be required for the reduced strength.

There is no proper laundry ; only a very dark room used as a women's wash-house, which is not provided with suitable conveniences. It has no fixed tubs, gratings, nor drying stove, although there is plenty of space for all that is required.

Next the wash-house there is a cleaning shed.

There are two cook-houses, one a large light building, with boilers and an oven, which is stated to consume the large amount of a pound of coal per man in cooking.

The second cook-house is a dark arched room, ventilated into the coal cellar. It has no oven.

There are two ash-pits in arched cellars, into which the ashes are thrown and removed by a separate door. A very good hopper for such ash-pits has been made by Mr. Macfarlane, of Glasgow, and should be applied to these. It diminishes the risk of nuisance, and is cleanly in use.

There is no drill shed. The passages are made use of for drill in wet weather. Water is supplied to these barracks at high pressure from the mains of the Stirling Water Company ; it is very pure and abundant.

There is tank space besides sufficient to hold 136,000 gallons of rain water.

Drinking fountains have been put up with great advantage. They are found to be very useful.

The privies have been recently remodelled on Macfarlane's plan. They are sufficient for sanitary purposes, except that the divisions between the seats are rather too small, and there are no half-doors. It would be well in future reconstructions, with Macfarlane's apparatus, to have them made with proper divisions, and the means of hanging half-doors on them. New urinals have also been supplied, but as they are not cleansed daily they are found to smell. It should be borne in mind that all improved sanitary contrivances require care in using and cleansing them.

The castle drainage is conducted down the rock to a large pit, from which it is allowed to flow over some meadow land.

Nuisance is complained of from this pit by persons frequenting the public walks below. We have been informed that steps are being taken to remedy this evil.

The gate guard-room is unventilated, and requires a louvre through the roof and a remodelled grate.

One of Mackinnel's double tubes, or a Muir's four-point ventilator, 18 inches square, would be sufficient.

The main guard is used as a place of confinement for deserters. It is not properly ventilated, and requires a louvre and remodelled grate like those recommended above.

Under part of the palace is a small, arched, ill-ventilated place, used as a black hole. It is not fit for prisoners.

On the west side of the castle, at about the greatest possible distance from the guard, are the prison cells. They are said to be damp in winter, and they are very inconveniently situated.

There are no quarters for married soldiers within the castle. There is no space for such accommodation, and the want of it is felt to be a great inconvenience. It is stated that there are buildings

adjoining the esplanade outside the castle, which, if purchased, would afford the required accommodation.

Stirling Castle affords an example of the inconveniences arising from an attempt to put buildings to a purpose for which they were never intended. The present construction hardly admits of improvement, even in the way of ordinary barrack accommodation; and, to add to the evil, a depôt has been established within the castle, while there are no conveniences for it.

The first question, as it appears to us, is, to decide whether so many depôts be necessary in Scotland, and whether with the existing railway facilities several of the existing depôts might not be dispensed with.

If the depôt were removed from Stirling Castle the whole question would be much simplified. It would resolve itself into finding within the present buildings sufficient space and conveniences for the small body of troops required for occupation, which is in reality all that can be done with the place. The attempt to crowd men where there is not room for them has led to complicated alterations in the old palace especially, whereby its character has been almost lost without contravailing advantage, while more than once there has been danger of the entire destruction of the buildings by fire. Indeed this may happen at any time under present circumstances.

If the depôt must be retained, we should strongly recommend that a proper barrack be built on the lower plateau adjoining the castle, or on some equally advantageous position, and suitably provided with conveniences. If this be decided on, the best thing to do would be to remove the men altogether from the old rooms, and to put them into a thorough state of repair.

*We shall confine our Recommendations, therefore, to the most needful Improvements. They are as follow:—*

1. Removing the men from the galleries of the palace rooms, and removing the galleries altogether; reducing the number of men in all the parliament house rooms to the extent shown in the table.

2. Ventilating the palace rooms by glass louvres in the top window panes. Ventilating the parliament house rooms by shafts from the ceilings to above the roof, and by louvred openings over the door. Ventilating the staircases by louvres and perforated panes. Serjeants' rooms to have perforated glass panes in the windows. Cundy's stoves to be used for warming the barrack-rooms.

3. Flagged floors of the lower barrack-rooms to be boarded.

4. Bathing accommodation to be extended up to four baths, with water laid on.

5. Women's wash-house to be provided with fixed tubs, gratings, water laid on, and a drying stove.

6. Ash-pits to be supplied with Macfarlane's hopper.

7. Both guard-rooms to be ventilated by louvres through the roof and remodelled grates.

### *Stirling Castle Hospital.*

The building appropriated to this hospital is an ancient house belonging to the Argyle family. It is situated at the end of the castle esplanade nearest the town, and opens on the public street. In front is a court, bounded on three sides by buildings, and on the remaining side by a wall. The part appropriated for sick is entered by a large lobby and staircase, out of which the old rooms now used as wards open.

There are four rooms used for sick. They vary from 21 to 46 feet in length. They are about 19½ feet broad. Two of them are 9 feet 4 inches high, and two 11 feet 9 inches high. They contain in all 39 beds, with a space varying from 594 to 827 cubic feet per bed.

The details of the accommodation are given in the following table, contrasted with what the accommodation would be at about 1,200 cubic feet per bed:—

| Wards. | Total present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 14 | 7 | 7 |
| 2 | 6 | 4 | 2 |
| 3 | 13 | 7 | 6 |
| 4 | 6 | 3 | 3 |
| Total - | 39 | 21 | 18 |

At an average space of as nearly as may be 1,200 cubic feet these rooms will accommodate 21 beds.

The larger wards have one six the other five windows, placed opposite each other, and the two smaller wards have each two windows.

There are separate rooms for the serjeants and orderlies.

Besides being overcrowded, these wards have no means of ventilation, and the air in them is very impure.

To remedy this defect we would advise that a shaft be carried from the ceiling of each ward to above the roof of the building, that the larger wards have two inlets for air, one on each of the opposite sides, and that the two smaller wards have each one inlet.

The staircase also requires ventilation by a louvre through the roof and perforated panes in the windows.

In the two upper wards there are two blank windows which might be advantageously opened.

The fireplaces are of old construction, and are so imperfectly fitted up that they smoke almost continually. They should be contracted in the throat and remodelled. But in doing so care should be taken not to injure the structure.

An ablution-room, with a Macfarlane's basin and a bath, has recently been provided, but hot water has not been laid on, and the present means of heating water in the kitchen are deficient.

The water-closets are on Macfarlane's plan, and are outside the building, but connected with it by a covered way. These closets are deficient in ventilation, and should be improved in this particular.

There is no hospital laundry. The provision store is not good. There is no accommodation for the sick of soldiers' families.

Taken as a whole this hospital cannot be described as being good, but it may be materially improved in every way except in overcrowding, which can only be removed by increasing the extent of space for the sick.

*We have indicated above the chief Sanitary Improvements, which may be summed up as follows:—*

1. Reducing the number of beds in each ward to the extent shown in the table.

2. Ventilating each ward by a shaft and inlets, and remodelled grates. Ventilating the staircase by a louvre and perforated glass panes.

3. Laying on hot water to the bath and ablution room.

4. Improving the ventilation of the water-closets.

With regard to additional hospital accommodation, this might be obtained in the present buildings by removing out of them a number of offices and quarters; or, if the barracks be extended, provision for a separate hospital might be made, better adapted for its object than is this old mansion.

---

## IV. GLASGOW BARRACKS.

There are two barracks in the city of Glasgow, one for infantry, to which the hospital is attached, and another for recruits.

### 1. Glasgow Infantry Barracks.

These barracks are situated at the east end of Glasgow within a square surrounded by high walls, and containing an area of 4a. 2r. 3p. The front wall and gate skirt a wide public street, and on the three other sides the boundary is isolated from dwelling houses by streets. The river Clyde passes about half a mile distant, at a level not much below that of the barrack. The subsoil is clay, resting on sandstone.

The buildings are about 60 years old, and are all of stone. They consist of two blocks of men's quarters, one on either side the parade ground, with a block of officers' quarters at the upper end between them. Behind the officers' quarters, and close to the back boundary wall, are the hospital, prison, barrack, offices, &c.

The local position of these barracks is not a very good one, and the buildings are in a defective state of repair, so much so that they have been condemned, and sites have been sought on which to construct new barracks.

The men's rooms are in six houses, three in each range. These houses are four stories high, and are reached by passages and stone staircases running through and through the buildings, giving entrance right and left to the rooms.

The rooms are back to back, and have each one window 3 feet 10 inches high by 9 feet in width. There are 66 men's rooms, all of a size. They are 26 feet long, 20 feet broad, and 9 feet 4 inches high. Each room has regulation accommodation for 12 men at 404 cubic feet per man. The total accommodation, compared with what it would be at 600 cubic feet per man, is as follows :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 66 | 792 | 528 | 264 |

There is accommodation for only 528 men in these rooms, and it will be necessary to reduce the regulation number of men from 12 to 8 per room.

There is a certain extent of ventilation provided by circular openings through the end wall of each room into the staircases, by circular openings between the rooms, and by a few openings apparently into the chimneys.

The plan is not well arranged, and would really do little more than allow the foul air of all the rooms to intermingle. We are of opinion, nevertheless, that much may be done to improve the present ventilation at a trivial cost, without incurring the expense of ventilating shafts, which we scruple to recommend in this instance, as the barrack will probably be given up in a short time.

We would propose to ventilate each staircase more efficiently than it is at present by carrying a large louvre through the roof from the ceiling, and by inserting four squares of perforated glass into the upper sash of each stair window.

We would next propose to improve the method of admitting fresh air into the rooms from the staircases, by providing the circular openings from the staircases into the rooms with wooden louvre boards, so arranged as to throw the inflowing air current towards the ceiling of the room.

We would further propose to obtain an outlet for foul air by placing a large-sized Arnott's silk flap ventilator into each chimney close to the ceiling; and in order to preserve the ventilation of each room distinct from that of the others, we would close permanently all the circular openings between the rooms.

The men's rooms are lighted by candles, but there is gas in the library.

It is doubtful if the cost of introducing gas into the barrack-rooms should be incurred, especially as the barrack is not to be permanently used.

There is a school-room on the first floor of one of the houses. It consists of two barrack-rooms thrown into one. It has two fireplaces, with an Arnott's ventilator introduced into the chimney of each, and it has circular openings into the staircase for admitting air. These openings should be provided with louvres like those in the barrack-rooms.

The infant school is a barrack-room, and requires ventilation in a manner similar to those rooms.

One of the ground-floor rooms is used as a library and requires ventilation in a similar manner.

Four ground-floor rooms, two in each wing, have been set apart as ablution-rooms. The position of these rooms is very objectionable, from their tendency to diffuse damp air through the buildings, and were the barracks intended for permanent occupation we should have recommended their entire removal. These ablution-rooms are provided with slate tables, for which it is proposed to substitute fixed iron basins and footpans, on Macfarlane's principle. As there are no baths, it would have been better, under the circumstances, to have left the present tables as they are, and to have put up baths with the money, but not in these rooms. Five baths would be required for the reduced strength consequent on allowing 600 cubic feet of space per man.

These ablution-rooms have neither gratings, pegs, nor forms, all of which could be supplied at a small cost; and the rooms also require ventilation by perforated glass panes in the windows.

There are two women's wash-houses also on the ground floor of the blocks, and under men's rooms. Their position is most objectionable; so much so, that it would be very desirable to remove them altogether; a measure which we should recommend were the barracks to be considered as permanent. A similar remark applies to the cook-houses, of which there are five, all situated under the men's rooms. They are supplied with boilers, and ovens have been authorized, which are to be placed, not in the present cook-houses, but in buildings at the end of each range now used as cleaning-sheds.

Means should be taken to ventilate the cook-houses and wash-houses as efficiently as possible, either by shafts 12 inches square, carried up from the ceiling of each above the roof, or by large openings through the external walls close to the ceilings.

Until recently, the privies of these barracks were placed over cesspits, and were a great nuisance, but they have been reconstructed on Macfarlane's principle, with receptacles in which water will stand; and as there were no drains for removing their contents, a plan has been introduced for doing so, which can be applied in many barracks similarly circumstanced. The ground behind the latrine is lowered, so as to permit a water-tight cart to be placed under the pipe leading from the latrine. The lid of the cart is opened, and the contents of the latrine are flushed into it, and removed. This plan is safe and inoffensive, but as it is of importance to limit the quantity of water used in flushing, so as not to overload the cart, the soil is not effectually washed away with water, as it would be if the pipe terminated in a drain, and hence it is needful to have the latrine properly cleaned out by hand labour. This is done in the public latrines which have been established on the same principle in Glasgow, but it is not done in the barrack latrine, and hence all the advantages of the system of removal are not obtained. It is a point of management which could be easily carried out.

The buildings containing these latrines require more light through the roof.

The urinals are of a very defective form, and should be reconstructed, and supplied with water.

Ash-pits are in use in these barracks. They are large and deep, and they are besides unnecessary, as a cart would answer every purpose of collecting and removing the barrack refuse daily.

There is an ample water supply derived from the Glasgow Water Company, at a rent of 40*l.* per annum.

The guard-room has two openings through the ceiling into the roof, but these are not sufficient for ventilation. A shaft should be carried from one of the openings up through the roof. It should have louvres to the open air; and about six inches below the ceiling, and under the opening of the shaft, there should be louvres placed to throw any accidental down draft towards the ceiling. The guard-room grate should be remodelled, to warm part of the air admitted.

The canteen tap-room and non-commissioned officers' room are unventilated, and require Arnott's silk flap ventilators into the chimneys.

There is no covered drill shed; nor is there any space on which to erect one. The accommodation for trades is deficient, and there is no accommodation for married soldiers.

The floors of nearly all the soldiers' rooms are worn out, as are also the stone steps of the stairs, &c.

As a new barrack is in contemplation, and a site is being selected, we do not consider it to be necessary to do more for the present buildings than to advise the most urgent sanitary improvements to be carried out in the simplest practicable way, and at the least possible cost.

*These improvements are as follow:—*

1. Reduction of the number of inmates from 12 men to eight men per room.

2. Ventilation of all the staircases and passages by louvres carried from the ceiling of the stair through the roof, and by perforated glass panes in the windows. Ventilation of all the barrack-rooms by a large-sized Arnott's ventilator into the chimney, and by louvre boards placed in the circular openings from the staircase, the boards being arranged to throw the inflowing current up to the ceiling. Similar louvre boards to be provided for the openings in the library, school-room, and infants' school; the two latter to be provided with Arnott's ventilators. All the circular openings between the rooms to be closed. Serjeants' rooms to have Arnott's ventilators in the chimneys.

Guard-room to be ventilated by a shaft carried through the roof, and louvre boarding to be placed 6 inches below the opening of the shaft, to throw any accidental down draft up to the ceiling. Guard-room grate to be remodelled, to warm part of the air admitted. Canteen tap-room and non-commissioned officers' room to be ventilated by an Arnott's ventilator into the chimney.

3. Ablution-rooms to be provided with gratings, pegs, and forms, and to be ventilated by perforated glass panes in the windows.

4. A bath-house, with five baths, and water laid on, to be provided.

5. Cook-houses and wash-houses to be ventilated in one of the ways pointed out.

6. Urinals to be reconstructed, and supplied with water.

7. Ash-pits to be abolished, and carts for the daily collecting and removal of the refuse to be substituted. Arrangements to be made for the daily cleansing of the latrines.

*Glasgow Barrack Hospital.*

This building is situated behind the officers' quarters. It is three stories high, and consists of two wings, with a centre projecting behind them. In the centre there is a spacious entrance and staircase reaching the whole height of the building. The wards and offices enter right and left from it, and the kitchen, wash-house, ablution-room, &c. are in a small yard behind.

The building, taken as a whole, is by no means in a good condition. The oil painting is in a bad state, and the walls and ceilings were not clean at the time we were there.

Necessary improvements have been delayed, apparently because the barrack has been condemned; but we would submit that the hospital should at all events be properly kept until the day of its evacuation.

There are five wards, all nearly of the same dimensions. All are 42 feet long, four of them are 21 feet broad and 10 feet high, and one is 20 feet broad and 11 feet high. The present regulation accommodation is for 80 beds, disposed as follows:—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 16 | 8 | 8 |
| 3 | 16 | 8 | 8 |
| 4 | 16 | 8 | 8 |
| 5 | 16 | 8 | 8 |
| 6 | 16 | 8 | 8 |
| Total - | 80 | 40 | 40 |

The space in the wards will not divide equally so as to give 1,200 cubic feet per bed. Each ward will hold eight beds, at a trifle more than 1,100 cubic feet per bed, and we would propose to fix this number as the maximum for each ward.

Part of the hospital accommodation is misappropriated for recruiting purposes. The serjeant's room and surgery on the ground-floor are so used, and the result is that a ward is taken off the construction for the use of the serjeant, and a room has to be found for the surgery.

We should advise that the recruiting duty should be at once removed to the new recruiting barrack, and that as much of the additional ward accommodation as possible be provided by restoring the rooms to the hospital, after putting them into a fit condition to receive sick.

Each ward has seven windows, all of which have the upper sashes hung with cords and pulleys to draw down; but none of the lower sashes are moveable. This is a defect which ought to be remedied.

Some ventilation is provided by two beams above the ceilings connected with the external air, but this method does not act efficiently in practice.

The existing openings in the ceilings can, however, be used as inlets, by removing the sliding covers, and placing a wooden louvre about six inches below each opening, so disposed as to throw the inflowing air-current up towards the ceiling, instead of permitting it to fall into the ward. It will be necessary at the same time to provide an outlet shaft for foul air, and this can be most easily and economically done by using one of the chimneys, of which there are two to each ward, as an outlet shaft.

The chimney furthest from the outer wall of each ward should be selected for the purpose. It should be bricked up below, and an opening made into the chimney shaft close to the ceiling. This opening should be double the sectional area of the shaft. The opening should be covered by a louvre, the blades of which slant upwards towards the ceiling, so as to throw any accidental down draft up to the ceiling.

The remaining fire-grate should be remodelled to warm part of the air admitted.

The hospital serjeants' and orderlies' rooms should have Arnott's silk flap ventilators introduced into the chimneys.

Ventilation is required for the staircase and passages. This could readily be provided by a shaft 18 inches square, to be carried from the ceiling of the staircase through the roof, to be protected above by louvres. Perforated glass panes should also be placed in the stair windows.

The hospital is lighted by candles. Although gas

would be a great improvement, we should not consider it necessary to incur the cost of its introduction, unless there were no immediate prospect of the removal of the barrack.

The means of ablution and bathing for the sick are defective. They consist of a detached wash-house behind the hospital, in which are three basins and a slipper and shower bath, the latter being unserviceable.

The place is not fit for sick men to go to, and it would be very advisable, as a temporary expedient, to find space for two or three of Macfarlane's wash-hand basins within the hospital.

More permanent provision of ablution and bathing accommodation would of course be necessary if the hospital itself were to be considered as permanent.

Connected with the first floor of the hospital are two water-closets, neither of which has any independent means of ventilation. A louvred shaft a foot square should be carried from their ceilings up through the roof.

In the back yard behind the hospital is the kitchen. It has an oven, but it is not sufficiently supplied with means of cooking, except for temporary purposes. Close to the kitchen is a large deep covered ash-pit, which is simply a nuisance, and ought to be removed altogether. An iron barrow, placed where the ash-pit is, would be sufficient for the daily collection and removal of the refuse.

This hospital, like the barracks, is in a defective state of repair. For a similar reason, and in the hope that the whole establishment may be speedily removed, we shall limit our recommendations to those matters which are of immediate necessity for the welfare of the sick. *These are as follow:—*

1. Reducing the number of beds in each ward to the extent we have pointed out.

2. Removing the recruiting duty out of the hospital, restoring the rooms occupied by it to the hospital, and arranging the accommodation so as to have as much ward space as possible.

3. Ventilating each ward by converting one chimney into an outlet shaft, and by placing louvres over the present ceiling ventilators, as described. Remodelling the grates, to warm part of the admitted air. Ventilating the staircase by a shaft and perforated panes. Ventilating the water-closets by shafts, and the serjeants' and orderlies' rooms by Arnott's ventilators.

4. Providing ablution accommodation within the building.

5. Removing the ash-pit, and providing a barrow for the daily removal of the refuse.

---

### 2. Glasgow Recruiting Barrack.

This barrack is situated in Shamrock-street, towards the north-western extremity of Glasgow. It is quite new, and consists of two dwelling houses, leased for ten years at a high rent. They were built for the purpose of a barrack by a private individual, but as they are merely held on lease, he has arranged them so as to be able to convert them into dwelling houses afterwards.

The two houses are exactly alike, and are in the line of the street. They have a yard at the back, the only access to which is through the houses.

Each house has a ground floor and three upper floors. On the ground floor are four rooms in each house, of which one is an ablution and bath-room, with a range of Mr. Macfarlane's fixed basins and foot-pans, a bath with hot and cold water laid on, and also a shower bath. The other ground-floor rooms are appropriated as stores, barrack serjeants' quarters, guard-room, and one is temporarily allotted as a dining-room for the men. This latter room requires properly fitted up seats round the wall, &c. Upstairs there are two large rooms, and one small room off each landing. The large rooms have been formed by leaving out the partitions between two rooms, and hence they have windows at each end, and two fireplaces. Some rooms have three fireplaces, from a similar cause. There is a small grate of fair radiating power fitted to each fireplace, and gas is laid on to all the rooms. There is also a leaden sink with a cover, and water laid on in each room. None of the rooms are ventilated. We would propose to remedy this defect by converting one of the chimneys into a shaft for removing foul air, by having an opening made into it near the ceiling, covered with a grating, giving a clear sectional area double that of the chimney; the other chimneys should have Arnott's large sized ventilators introduced close to the ceiling. In order to provide inlets for fresh air, one pane in the upper part of each window should be of perforated glass.

The small rooms on the landings are intended for non-commissioned officers, and should have each an Arnott's ventilator in the chimney. These rooms have each a range with oven and boiler, also a sink with water laid on, and they are lighted with gas.

A wooden partition is put up to contain the bed.

The passages and staircases require to be ventilated. This can easily be accomplished by carrying a shaft 12 inches square from the ceiling of the staircase up through the roof. The shaft should be protected by louvres. The stair windows should have perforated panes to act as inlets.

The kitchen has boilers of the ordinary pattern, but no oven.

The women's wash-houses, of which there are two, have fixed tubs, with water laid on, and gratings, and also a louvre in roof. There is a dark unventilated water-closet inside each wash-house. A shaft should be carried from the ceiling of each, up to a louvre in the roof, and additional light should, if possible, be given. There is no drying stove.

The privy is of Macfarlane's ordinary construction of water latrine, with small divisions, but the lean-to building in which it is placed is deficient in light and ventilation, and the latrine is not properly kept. A skylight and louvre should be placed in the roof.

The guard-room, which is a room on the ground floor, should have an Arnott's ventilator in the chimney.

It is unnecessary to do more to this barrack, as it is only on a lease, and the recruits are a very short time there; indeed it is better in structure and arrangement than many buildings erected expressly as barracks.

*Our recommendations are therefore as follow:—*

1. Ventilation of the rooms by converting one of the chimneys into an outlet shaft in the manner described, by introducing Arnott's ventilators into all the other chimneys, including the guard-room, and a pane of perforated glass into the upper row of each window; ventilation of the staircases and passages by shafts and perforated panes.

2. Ventilation of the water-closets in the wash-houses by shafts; ventilation and lighting of the latrines by a louvre and skylight.

---

## V. AYR INFANTRY BARRACKS.

These buildings were not originally destined for their present use. They were built in the year 1794 for a sugar house, and have been altered and added to in order to render them fit for barracks.

The enclosure within which they are situated is a strip of sandy land lying between the river Ayr and the sea at the extremity of the town of Ayr. Its area is 5 acres and 28 perches. Its surface level is not much raised above high-water mark, but as the buildings are only about 50 yards from the sea, and freely exposed to the sea breeze, the position is a healthy one.

The men's rooms are in a large block placed near the middle of the enclosure. This block consists of

a centre and two wings in line. The centre is six stories high, and the wings are four stories high. Access is obtained to the rooms by two through and through passages and staircases, the latter of which are carried up between the centre and the wings. Out of the landings entrance is obtained to six stories of men's rooms on one side of the stair, and to four stories of rooms on the other side.

The stairs are very much out of repair, and have to be supported by struts, to prevent their giving way. The staircases are, however, roomy, light, and admit of easy ventilation.

The rooms are back to back, with two low windows on one side, and the window sashes slide horizontally. There are two circular openings through the wall between each pair of rooms. They are intended to facilitate ventilation ; but if both sets of rooms were occupied by men these openings would be injurious, by allowing the foul air of the rooms to pass from one room to the other.

There are in all 36 men's rooms, three of which, Nos. 4, 5, and 6, are occupied by the pensioners' establishment, although they are still on the construction as men's rooms. By present regulation these rooms contain 12 men each, and there ought to be space for 432 men in the building, with from 333 to 368 cubic feet per man.

The following table gives the details of this accommodation :—

| Rooms. | Total present Regulation Number of Men. | Total Number of Men at 600 Cubic Feet each. | Total Deficiency of Accommodation in Men. | Number of Men to be placed in each Room. |
|---|---|---|---|---|
| Nos. 3, 6, 7, 10, 11, 14, 21, 24, 25, 28, 29 - | 132 | 77 | 55 | 7 |
| Nos. 1, 2, 4, 5, 8, 9, 12, 13, 15, 16, 17, 18, 19, 20, 22, 23, 26, 27, 30, 31, 32, 33, 34, 35, 36 | 300 | 200 | 100 | 8 |
| Total - | 432 | 277 | 155 | — |

In this as in other similar cases we have not exacted 600 cubic feet per man, on account of the position and exposure of the barrack, and the very free external ventilation of the buildings generally.

It will be necessary, however, to reduce the numbers of men in the first set of rooms in the table from 12 to 7 men per room, and in the second set from 12 to 8 per room, to give the minimum cubic space each man should have.

None of the rooms are ventilated, and they will each require a shaft of the proper sectional area to be carried from the corner of each room to above the roof. It would be both difficult and expensive to provide inlets of the usual construction, on account of the great thickness of the walls. We would, therefore, propose to admit fresh air to the rooms from the staircases, taking every precaution at the same time to keep the staircases freely ventilated. The easiest way of providing an inlet from the stair would be to cut an opening of the required sectional area over the door frame and under the stone lintel. The opening should slant upwards, and enter the room near the ceiling, and, if necessary, a louvre board should be placed over it within the room, to throw the inflowing air current up to the ceiling.

The rooms are warmed by a very defective old form of fire-grate. It ought to be remodelled, to warm part of the admitted air ; but it appears doubtful whether the expense of constructing the proper flue in walls of such solidity would not be too great. This question will have to be settled by an estimate, and if the cost be excessive, it will be necessary to provide some other method of warming the air. In any case, however, new fire-grates would be required. Those on the principle of the Anglo-American stove would be the best.

As we propose to admit the fresh air required for all the rooms from the staircases, it will be requisite to ventilate the staircases efficiently by carrying a louvred shaft from the top of each through the ceiling and roof. Perforated glass panes would also have to be placed in all the windows.

If it be found too expensive to remodel the fire-grates, the next best expedient would be to heat the air admitted into the staircases in winter by placing a Nettleton's stove, or one of the ribbed stoves of Mr. Goldsworthy Gurney, on the first landing of each staircase. Additional cost would, however, have to be incurred for coals and superintendence if this plan of warming the air were adopted. Estimates for both plans should be prepared, including the last contingencies.

All the rooms are lighted with candles, although gas could be readily obtained. A ventilated gas-burner should be introduced into each room.

There are no non-commissioned officers' rooms, except the barrack-rooms, and there is no accommodation for married soldiers. There are no cleaning-rooms, drill sheds, nor workshops.

There is no day-room, school-room, nor library. There are neither ablution-rooms nor baths.

There are four cook-houses furnished with coppers, but without ovens. Two of these cook-houses would be sufficient for the wants of the men ; and it has been proposed to convert the other two, one at the foot of each staircase, into an ablution-room.

The objection to this, and indeed to the present position of the cook-houses, is that they would all ventilate themselves directly into the staircases, out of which the rooms are to be supplied with fresh air. The only way to avoid this evil would be to close up the present doors into the staircases, and to open a door for each cook-house and lavatory to the external air. If this were done, and if perforated glass panes were put into the upper row of the windows in the kitchens and lavatories, the effluvia and damp from them would be no detriment to the men's rooms.

Each cook-house should have an oven. Three baths, with water laid on, would be required.

The women's wash-house is too dark. There is a hood over the boiler to carry off the steam. There are no gratings nor fixed tubs, and there is no drying stove.

The present water supply is derived from two wells about 20 feet deep. They are excavated in a sandy soil, about 50 or 60 feet from the barrack cesspits. The water is stated to be very hard, and unfit for washing clothes.

We have been informed that authority has been given for laying on the town water, and the sooner this is done the better.

There are three privies, all in a very bad and unwholesome condition. They are of the usual construction ; dark, unventilated, and placed over cesspits. Behind the privy is a large hole, which serves as an ash-pit, and into which the carts are led to remove the filth and refuse. This hole had a considerable quantity of liquid filth in it.

There is no drainage, except surface drainage, although a ready outlet could be obtained to the sea.

All the privies should be forthwith reconstructed as water latrines on Macfarlane's principle, and they should have sufficient light and ventilation provided through the roof.

One of two ways might be adopted for cleansing them. The latrines and water-closets of both barrack

and hospital might be readily drained by carefully laid pipe drains to the sea. Or, if it be an object to save the manure, a plan similar to that in use at Glasgow barracks might be adopted, by which the contents of the latrines, water-closets, and urinals might be discharged into a water-tight covered cart, and removed daily. When the privies are reconstructed, proper urinals supplied with water for cleansing should also be provided.

There is a good light guard-room with a verandah. There are two round openings in the ceiling for ventilation, but they are not enough. One of them should be converted into a louvred shaft, and carried through the roof. The fire-grate should also be remodelled, to heat part of the air admitted.

Two cells adjoining are ventilated and lighted by grated openings at a considerable height. It would improve the ventilation to make an opening through the ceiling into the roof, and a louvred opening in the ridge.

There is a good canteen, unoccupied at present. It has a light cheerful tap-room, which might very well be used for a day-room or reading-room for the men.

*The following are the Sanitary Improvements required for Ayr Barracks;—*

1. Reduction of the numbers of men in each room to the extent specified.

2. Ventilation of each room by a shaft carried from the ceiling to above the roof. An inlet for air to be provided over each door. The openings between the rooms to be closed up. The staircase to be ventilated by a louvred shaft, and perforated panes in the windows. The admitted air to be warmed in winter, either by remodelling the grates, or by stoves in the staircases, as described.

3. A ventilated gas-burner to be introduced into every barrack-room.

4. Two of the cook-houses to be provided with ovens; to be ventilated by perforated glass panes, and to have a new door to the open air, and the present doors into the passage to be closed.

5. Two ablution-rooms to be made out of two cook-houses, to be ventilated in a similar manner, and a similar change in the doors to be made. Three baths with water laid on to be provided.

6. Women's wash-house to be provided with fixed tubs, and water laid on, gratings, and a drying and laundry stove. More light to be given.

7. Town water supply to be introduced.

8. All privies to be reconstructed as water latrines on Macfarlane's principle, and their contents disposed of in one of the ways mentioned. All cesspits to be abolished, and the ash-pits to be filled up to above the level of the ground, and to be properly paved and drained. Urinals to be reconstructed, and supplied with water.

9. Ventilation of guard-room to be improved by a shaft and remodelled grate, and the ventilation of the cells by openings in the ceiling and ridge, as described.

### *Ayr Barracks Hospital.*

This hospital is situated at one end of the parade ground under a low cliff, which at this point overlooks the barrack enclosure. The building is two stories high, and has a roomy light passage and staircase from front to back.

The kitchen, privies, wash-house, dead-house, &c., are in a small back yard.

On the ground floor are placed a large and small ward and the serjeants' room, and over these are a large and small ward and the surgery.

The two large wards are each 40 feet long, 23 feet broad, and 11 feet 3 inches high, and they have three windows on each of the opposite sides, with the beds ranged between them. They look spacious, light, and cheerful, although the window sills are rather too high.

There is regulation space for 40 beds, disposed as follows:—

| Wards. | Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 18 | 9 | 9 |
| 2 | 18 | 9 | 9 |
| 3 | 2 | 2 | — |
| 4 | 2 | 2 | — |
| Total - | 40 | 22 | 18 |

The two larger wards will hold nine beds each, with 1,150 cubic feet per bed, and the two smaller wards will hold two beds each, at 950 cubic feet per bed. Twenty-two beds is, therefore, the maximum number which the hospital ought to contain.

Only one ward has any provision for ventilation by openings in the ceiling, but the method is defective; and we would advise a proper system of ventilation to be introduced throughout the hospital.

Each of the large wards Nos. 1 and 2, has two fireplaces, one at each end. We would recommend that the fireplaces in these wards against the outer walls should have remodelled grates, for warming part of the air admitted in winter, and the other fireplace being unnecessary might be built up, and the chimney flue might be converted into an air shaft, by making an opening into it double the sectional area of the flue. This opening ought to be made close to the ceiling.

Two inlets for air would also be required, one on each side of the long wards close to the ceiling, but not opposite each other. The present ventilating openings in the ceiling should then be closed.

The two smaller wards would be sufficiently ventilated by a large sized Arnott's silk flap ventilator in the chimney, and by one inlet for air close to the ceiling.

The passage and staircase windows should have a few perforated glass panes introduced into the upper sashes.

The wards are lighted with candles. When gas is introduced into the barracks, a properly ventilated gas-burner should be put up in each ward.

There is no lavatory nor bath-room for the sick, and there are no water-closets; but there are two most offensive privies over cesspits in the yard. An addition might easily be made to the hospital, containing a bath, with hot and cold water (the former supplied from the kitchen), a Macfarlane's ablution table, and a water-closet.

The cesspits in the hospital yard should be abolished, and the privies drained, and reconstructed with Macfarlane's water latrines.

The hospital wash-house has a boiler, but no fixed tubs. It is too dark, and requires a skylight, and a louvre for ventilation.

The hospital water supply is at present derived from the pumps in the barrack yard. The town water should be introduced over the hospital when it is brought into the barracks.

The kitchen is imperfectly supplied with means of cooking. It requires a proper range with an oven, and when this is done means of heating the bath recommended above should be introduced.

This hospital is deficient in bedding store, pack store, and provision store; and there is no accommodation for the sick of soldiers' families.

*The following are the Sanitary Improvements required;—*

1. Reduction of the number of sick to the extent stated.

2. Ventilation of the two large wards, by converting one chimney flue into a ventilating shaft

in the manner described, and by two inlets for air. One fire-grate to be remodelled to warm part of the air admitted. The two smaller wards to be ventilated by Arnott's silk flap ventilators, and by one inlet each. Stair and passage windows to be ventilated by perforated panes.

3. A ventilated gas-burner to be introduced into each ward.

4. An addition to the hospital to be made, capable of containing a bath with hot and cold water, the former supplied from the kitchen, an ablution table, and a water-closet.

5. All cesspits to be abolished, and the hospital privies drained, and reconstructed with a Macfarlane's water latrine.

6. Hospital wash-house to have fixed tubs, and water laid on, and to be better lighted and ventilated.

7. A proper water supply to be provided for the hospital.

8. Kitchen to be provided with a proper cooking range.

---

## VI. PAISLEY BARRACKS.

These barracks are situated on the north side of the high road leading from Paisley to Glasgow, at about a mile distant from the former town.

The enclosure is a parallelogram six acres in extent, very slightly elevated above the general level of the surrounding district. The neighbourhood is open, airy, and healthy.

These barracks were erected in 1821, and the buildings are all of stone. Along one side of the parade ground, and parallel with the high road, is a long block of buildings containing men's quarters. The adjacent western side is occupied by officers' quarters and by the hospital. The remaining sides are open.

Between the men's quarters and the boundary wall is a row of low buildings, containing workshops, offices, &c.

The rooms are arranged in six houses, two stories high. There are four rooms to each house, but there are no thorough passages and staircases such as exist in the better class of barracks, and access is obtained to the rooms by a wooden lobby and stair boxed off from the cubic contents of the rooms. By this arrangement 490 cubic feet are taken from the contents of each room. The plan is a bad one, because it complicates the structure, and interferes with ventilation. These defects of structure are still further increased in some of the rooms by a serjeant's bunk being placed behind the projection caused by the staircase. The arrangement gives the rooms a gloomy uncomfortable appearance, while it tends to stagnate the air in them, and to render ventilation difficult.

The rooms are all of a size, and are intended by existing regulations to hold 15 men each. The following table shows the accommodation, contrasted with what it would be at about 600 cubic feet per man :—

| Number of Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. | Number of Men to be placed in each Room. |
|---|---|---|---|---|
| 16 | 240 | 176 | 64 | 11 |

By reducing the regulation number of men per room from 15 to 11, each man will have under 600 cubic feet, and 11 men is the maximum number which ought to be placed in a room.

Each room has two windows, one at either end, They are fixed below, but the upper sash opens on a pivot.

There are openings in the ceiling for ventilation, but they are not enough. Each room will require a shaft carried from the ceiling to above the roof, and two inlets for fresh air, one on each side above the windows.

The fire-grates are of a wasteful construction, and should be replaced by remodelled grates, to warm part of the admitted air.

All the rooms are lighted with gas.

There is no day-room for the men.

A men's room has been taken off the construction as a school-room. It requires to be ventilated, like the barrack-rooms.

Another men's room has been set apart as a library, and the librarian's quarter is a wooden bunk in the corner.

The ablution-room is fitted up in the usual manner with benches, water-basins, &c. The bench requires a bead to prevent the water dashing over on the men. There are no pegs, and there is no bath. One bath has been authorized. There ought to be two.

The ablution-room requires more light and ventilation through the roof.

There is a women's wash-house, but it is imperfectly fitted up, and requires fixed tubs, with water laid on, a grating to stand on, and a drying stove.

The cook-house has ten boilers, but no oven. This want should be supplied. A skylight and louvre should at the same time be placed in the roof.

There is a cleaning-room, part of which, as we were informed, is to be taken off to hold the bath.

There is no drill shed.

A good water supply is laid on to the barracks by contract with the Paisley Water Company.

Part of the surface drainage only is trapped at present. All the gulley grates should have proper traps provided.

The privies are in a very noxious condition. They are drained into a cesspit behind. They should be reconstructed on the principle of Macfarlane's water latrines, and a suitable outlet for the drainage should be found, either into a drain, or by applying the liquid to irrigate land at a sufficient distance from the barrack ; or if an outlet cannot be obtained in one or other of these ways, the contents of the latrine should be flushed out into a water-tight cart, and removed daily, on the plan in use at Glasgow barracks.

The present arrangement of urinals is defective, and proper urinals, supplied with water for cleansing, should be constructed, instead of the present ones.

The ash-pits are not properly constructed. They are sunk below the level, and not being properly drained they accumulate water. To prevent this evil, they should be filled up, and raised a few inches above the level. They should be paved and drained, and the refuse should be removed at short intervals.

The guard-room requires ventilation by one of Mackinnel's or Muir's ventilators in the roof.

The canteen tap-room and the non-commissioned officers' room require Arnott's ventilators into the chimneys, and perforated glass panes for the windows. The tap-room should have a better grate.

The armourers' shop requires more light by a skylight.

Paisley barracks have no married accommodation for either non-commissioned officers or men, and there is no mess-room for non-commissioned officers.

*The following are the Sanitary Improvements required :—*

1. Reduction of the number of men in each room to the extent specified above.

2. Ventilation of each room, and of the library and school-room, by a shaft, inlets, and remodelled grates. Guard-room to have a ventilation in the roof. Canteen tap-room and non-commissioned officers' rooms to have Arnott's ventilators in the chimneys, and perforated panes in the windows.

3. The ablution-room to have more light and ventilation through the roof. A bead to be put to the table. Pegs to be supplied. An additional bath to be put up besides the one authorized.

4. Women's wash-house to have fixed tubs, a grating for the feet, and a drying stove.

5. Cook-house to have a roasting oven put up, and to have a skylight and louvre in the roof.

6. Privies to be drained to an outlet in one of the ways suggested, and to be reconstructed as water latrines on Macfarlane's principle. The urinals to be reconstructed, and supplied with water. Ash-pits to be filled up, paved, and drained, and their contents removed at short intervals.

*Paisley Barracks Hospital.*

The hospital is situated in an angle of the boundary wall. It is one story high, and not sufficiently raised above the ground. It has a verandah in front, and a small enclosed yard behind, but it is not cut off in front from the parade ground.

The accommodation within the buildings consists of a surgery, pack store, serjeants' room, a small ward, and two large end wards. There is besides these an additional ward of wood, and a small itch ward, the whole being connected by a corridor. In the yard behind the hospital are the kitchen, privies, dead-house, wash-house, ash-pit, &c. The present regulation accommodation is for 32 beds, with about 700 cubic feet per bed, disposed as follows :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 9 | 6 | 3 |
| 2 | 2 | 1 | 1 |
| 3 | 9 | 6 | 3 |
| 4 | 12 | 8 | 4 |
| Total - | 32 | 21 | 11 |

By giving a little more than 1,000 cubic feet of space per bed, the wards will hold 21 sick, in the proportions given above, a proportion which ought to be amply sufficient for the force.

If the accommodation in barracks were reduced to 176 men, every man in hospital would have at all ordinary times above 1,200 cubic feet of space.

The amount of accommodation is therefore sufficient, but the excess of beds ought to be at once removed from the wards.

The wards are partially ventilated by openings through the ceiling into the roof. The ventilation could be more under control if a shaft were carried from the ceiling of wards 1, 3, and 4, through the ridge, and if two inlets for air, one on each side the ward, were made close to the ceiling. In the wooden ward, perhaps, the best way would be to convert one of the chimney flues, of which there are two, into a ventilating shaft, by closing the fireplace, and making an opening into the flue close to the ceiling. The other fire-grate should be remodelled. Ward No. 2 may be ventilated by an Arnott's silk flap valve. The corridors should have louvres carried through the roof, to keep up a circulation of air in them.

There is gas in the wards.

There is no bath and no lavatory accommodation Both deficiencies could be easily supplied.

There is no water-closet, but there are defective privies in the yard.

A water-closet should be constructed in connexion with the lavatory and bath-room, and the privies drained and reconstructed on Macfarlane's principle. A proper urinal should also be provided.

The kitchen is insufficiently provided with the means of cooking hospital diets. It requires a new range with a roasting oven ; it also requires ventilation through the roof.

The wash-house and dead-house also require roof ventilation.

There is an ash-pit in the hospital yard, which ought to be removed.

*The following are the Sanitary Improvements for this Hospital :—*

1. Reduction of the number of beds per ward to the extent stated.

2. Ventilation of the wards by shafts and inlets as described. Ventilation of the kitchen, corridors, wash-house, and dead-house, through the roof.

3. A water-closet, a bath, and an ablution table, with hot and cold water, to be provided in connexion with the hospital. Privies in back yard to be reconstructed, and drained on Macfarlane's principle. A urinal to be provided. Ash-pit to be removed out of the hospital yard.

4. Kitchen to be provided with a new cooking range and oven, and to be ventilated through the roof.

## VII. HAMILTON CAVALRY AND INFANTRY BARRACKS.

These barracks are in an open, airy situation at the outskirts of the town of Hamilton. They consist of two divisons, one for cavalry, and the other for infantry. The cavalry barracks were built of stone in 1796, and are in two blocks on opposite sides of the parade ground. The officers' quarters are at right angles to them on the third side. In continuation of the parade ground is an exercising ground, along one side of which there are 26 brick hut barrack-rooms, which were erected in 1855 for the militia. At the end of the enclosure furthest from the cavalry barracks is the hospital. The total area within the barrack boundary is 10 acres 3 roods 24 falls Scotch measure. The subsoil is clay, but the ground is sufficiently elevated to admit of thorough drainage.

Cavalry Barracks.—The soldiers' rooms in the cavalry ranges are over the stables, and access is obtained to them by staircases, some of which are of stone, and others of wood. Behind each staircase is a projecting block of building, containing cook-houses and ablution-rooms down stairs, and the serjeants' mess, shops, &c. in the floors above.

At the top of the staircase is a long central passage or corridor, extending the whole length of each block, out of which the barrack-rooms open right and left. This passage is well provided with ventilating skylights, and it is light and airy, in comparison with similar passages in other cavalry barracks. It has besides, a window at the end. Opposite the top of the staircase is a space with a window, which at a trifling cost might be fitted up as a day-room.

The doors of the rooms are close to the fireplaces. This arrangement could be advantageously changed by shifting the door to the opposite end of the room. The windows are partly of a new and partly of an old form. The older windows have sliding sashes, and are in the back ranges of rooms. The front rooms have windows with sashes to lift up and draw down ; and the rooms where these windows have been introduced are much lighter and more airy than the others.

In the two ranges of cavalry barracks there are 17 soldiers' rooms, with regulation space for 136 men at about 515 cubic feet per man.

The following table shows the accommodation :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 17 | 136 | 119 | 17 |

The present number of men per room is eight. If it were reduced to seven each man would have a little less than 600 cubic feet.

Each room is supplied with two ventilators in the ceiling, connected with shafts which go above the roof. There are also sliding windows over the doors into the passage.

All that is required in the way of improvement in ventilation is to introduce an inlet of the usual construction in the outer wall, close to the ceiling of each room, and to reset the present grates so as to warm part of the air admitted in winter.

The end window of the passage should have a pane or two of perforated zinc, to admit fresh air.

The serjeants' quarters are at the end of each block. They are provided with Arnott's ventilators in the chimney. The serjeants' mess, which is situated in one of the projecting blocks upstairs, has no mess kitchen.

The saddlers' and shoemakers' shops are in a projecting building. They should have an Arnott's ventilator in the chimney.

In another of the projecting buildings is the school-room. It has some ventilation in the ceiling, and it is warmed by two grates. One of them should be remodelled, to warm part of the air admitted, and the other should have its chimney converted into a ventilating shaft, by an opening made into the flue close to the ceiling. Two inlets for air should also be provided.

The library is in a soldiers' room. Its grate should be reset in the same way as that recommended for the other rooms.

Gas is laid on to the barracks.

The ablution-rooms are on the ground floor of the projecting buildings. They are sufficiently provided with requisites, except baths. One bath would be sufficient for the cavalry barrack.

Water is obtained from the town supply. It appears to be sufficient.

There are two cook-houses with boilers, but they have no ovens. One oven is authorized to be put up.

There is a women's wash-house in a detached building. It has a small louvre in the roof, which is insufficient for ventilation. It has no fixed tubs, no gratings to stand on, and no drying stove. All these desiderata ought to be supplied.

The building itself is large enough for the cavalry barracks, but not for the infantry barracks.

The riding-school is well lighted, but it requires ventilation in the roof by raised ridge-tiles or by two louvres.

The women's privy is near the riding school, and has a cesspit close to and combined with the ash-pit. This privy should be converted into a water latrine, and provided with drainage, and the ash-pit should be abolished. The other ash-pits are too large; they should be raised and paved; and the dung-pits should be similarly improved.

There are two sets of men's privies, one on each side the exercising ground. One set is drained and constructed on Macfarlane's principle, with small divisions between the seats, and the buildings have light and ventilation by a barred window. The other set is of the ordinary construction, and is drained into the adjoining manure pits. These privies should be remodelled on Macfarlane's principle, and drained like the others.

The canteen is tolerably good, but it is too small when the infantry barracks are occupied. The tap-room and the serjeants' room require Arnott's ventilators in the chimney, and a perforated pane in each window.

The guard-room requires ventilation by means of one of Muir's four-point ventilators about one foot square. The grate should be remodelled to warm part of the air admitted.

Each cell should have a shaft six inches square in the ceiling, and warmed air should be admitted from the back of the guard-room grate.

INFANTRY BARRACKS.—The infantry barracks are in a long one-story brick building, erected against the enclosure wall, and have windows on one side only.

Each room has two fireplaces, one at either end, and four windows, two on each side of the door. The door is protected by a small wooden porch inside the room.

There are altogether 14 rooms, with regulation accommodation for 26 men each, with about 337 cubic feet per man.

The following table shows what the accommodation would be at 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 14 | 364 | 210 | 154 |

Each room ought to contain 15 men instead of 26.

Each room has an Arnott's ventilator, opening into a flue separate from the chimney, there being one of these extra flues between every two rooms. The amount of outlet so obtained is not sufficient, but it could easily be increased. One grate in each room should be remodelled, to warm the air admitted, the other should be closed up, and the chimney converted into a shaft for the removal of foul air, by making an opening into the flue close to the ceiling. The Arnott's ventilator should at the same time be removed from the opening into the present shaft.

The openings into these shafts should be double the sectional area of the flue, and each should be covered with a grating.

Two inlets for fresh air should be made in the outer walls close to the ceiling. One of these should, if possible, be on each of the opposite sides of the room, but not opposite each other. If the boundary wall does not admit of openings being made in it, both the inlets should be made in the front wall over the windows.

The ablution-room of these barracks is tolerably good. Water is laid on to a cistern; the ablution tables are of wood, and there are gratings to stand on, and pegs, but no baths. Three baths with water laid on would be required for the infantry barracks.

The cook-house is tolerably good. There are boilers of the old pattern placed in the middle of the floor. There is a louvre in the roof, which affords sufficient ventilation. There is no oven; one should be put up.

The privies empty into a cesspit, which should be abolished, and they should be reconstructed on Macfarlane's principle, and properly drained.

The guard-room for these barracks should have the grate remodelled, to warm part of the air admitted.

*The following are the Sanitary Improvements required for Hamilton Barracks :—*

1. Numbers of men in each cavalry barrack-room to be reduced from eight to seven men per room, and in the infantry barracks from 26 to 15 men per room.

2. Rooms in the cavalry barrack to have each one inlet for air, and a reset grate. End windows in the passages to have perforated glass panes. Saddlers' and shoemakers' shops to have Arnott's ventilators. School-room ventilation to be improved by converting one of the chimney flues into a ventilating shaft, as described. Two inlets for air and a remodelled grate to be provided. Library to be ventilated like

the barrack-rooms. Doors in the cavalry barracks to be removed to the end of the room furthest from the fire.

Infantry barracks to have two inlets for fresh air. One chimney to be closed, and the flue converted into a foul-air shaft, as described. The other fireplace to be remodelled. Arnott's ventilators to be removed from the existing shafts.

3. Ablution-rooms in both barracks to be provided with baths.

4. Infantry cook-house to have an oven.

5. Women's wash-house to be enlarged, to be better ventilated, and to have fixed tubs, water, gratings, and a drying and laundry store.

6. Riding school to be ventilated through the ridge of the roof.

7. All the privies within the barrack boundary to be drained, and reconstructed on Macfarlane's principle, and the cesspits to be abolished. The ash-pits and dungheaps to be raised a a little above the level of the surface, and to be paved and drained.

8. Canteen tap-room and non-commissioned officers' rooms to have Arnott's ventilators, and perforated glass panes for ventilation.

9. Cavalry guard-room to have a Muir's ventilator in the roof, and a remodelled grate, to warm the air in the guard-room and cells. Each cell to have an outlet shaft through the roof. Infantry guard-room to have a remodelled grate.

*Hamilton Barracks Hospital.*

This hospital is situated at the end of the exercising ground near the entrance. It has a small enclosed yard behind, but no enclosure in front for convalescents, although there is plenty of space available for the purpose. The building is of two stories, with a good central stair and passage going through and through the house.

On the ground floor there is a ward on one side of the passage and a serjeants' room, and the surgery on the other side. Upstairs there is a ward on one side the staircase, and a store-room and small ward on the other; the small ward is used as a pack store. The kitchen is in a one-story projecting building behind, and in the back yard are the dead-house, wash-house, privies, cesspit, &c.

The total present regulation accommodation is for 21 beds, with from 516 to 713 cubic feet each.

The following table shows the number of beds in each ward contrasted with what it should be at about 1,200 cubic feet per bed :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 9 | 6 | 3 |
| 2 | 9 | 6 | 3 |
| 3 | 3 | 1 | 2 |
| Total - | 21 | 13 | 8 |

Wards No. 1 and 2 will at the outside hold six beds each, giving considerably less than 1,200 cubic feet per bed. Ward No. 3, which is intended for serious cases, ought not to have more than one such case in it.

This hospital requires to be extended, to make it more commensurate with the requirements of the force, and there is plenty of space for the purpose.

The larger wards have a certain amount of ventilation through the ceiling; the lower ones by means of a hollow beam, and the upper ones by openings into the roof. An outlet shaft should be carried up from the ceiling of each ward to above the roof. The hollow beam in the lower ward should be converted into an inlet for air, by placing louvres at the side, arranged to throw the current up to the ceiling In the upper wards an inlet should be made on each side the ward. The fire-grates should be remodelled, to warm part of the admitted air.

Ward No. 3 is not ventilated. It requires an Arnott's valve and one inlet. Additional ventilation should be given to the staircase by panes of perforated glass in the windows.

The kitchen has an oven, an ordinary range, and two boilers. They are considered sufficient for cooking the diets.

The dead-house has no skylight nor ventilation, no proper table nor drainage, and it is used as a bath-room, on account of their being no ablution nor bathing accommodation in the hospital.

There is no water-closet connected with the building. There is a privy for the use of the sick in the yard. It empties into the ash-pit, which is in fact an open cesspit. It is offensive, and should be abolished at once; the privies being remodelled on Macfarlane's principle, and drainage provided.

The readiest way of supplying the defects stated above would be to add a story to the kitchen, and in the space so obtained to construct a water-closet, a bath-room with a bath, and hot and cold water laid on, and to put up a Macfarlane's ablution table. Access should be provided to these conveniences from the staircase.

A proper exercising ground for convalescents, with seats, is required.

*The following are the Sanitary Improvements required for this Building :—*

1. The extension of the ward space, and reduction of the number of beds in the present wards to the amount stated.

2. Ventilation of the wards by shafts, inlets, and remodelled grates, and by an Arnott's ventilator and inlet for the small ward as described. Ventilation of the staircase by perforated panes. Ventilation of the dead-house.

3. Space to be obtained over the kitchen for a bath-room, ablution-room, and water-closet. Privies in the yard to be drained, and reconstructed as water latrines. Cesspit to be abolished, and the ash-pit removed.

4. An exercising ground for convalescents to be provided.

---

## VIII. DUMBARTON CASTLE.

Dumbarton Castle contains two sets of barrack-rooms and a hospital. One of the barracks is situated between the summits of the rock on the western side, and is freely exposed to the winds. The other set of rooms is in the two lower flats of what was formerly the governor's house; and the upper flats of the house, which have a separate entrance behind, are appropriated as officers' quarters. These rooms are near the entrance gate, and face the south. The almost vertical walls of the rock rise directly behind them. A little higher up on the same side is a small house which has been used as a hospital since 1856. The space occupied by all the buildings is narrow and confined, on account of the nature of the ground, but the position is a healthy one.

The barrack accommodation is not very good. That in the upper barracks is the best. These barracks are open at both sides to the air, while the lower barracks are freely exposed only on one side.

There are six rooms in the upper barrack, with regulation space for 12 men each, with from 328 to 367 cubic feet per man; and the lower barrack contains seven six-men rooms, with from 370 to 400 cubic feet per man.

The following table shows the accommodation in

each room, in comparison with what it would be at nearly 600 cubic feet per man :—

| Rooms. | Present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Upper Barrack: | | | |
| 1 - - - | 12 | 8 | 4 |
| 2 - - - | 12 | 8 | 4 |
| 3 - - - | 12 | 8 | 4 |
| 4 - - - | 12 | 8 | 4 |
| 5 - - - | 12 | 7 | 5 |
| 6 - - - | 12 | 7 | 5 |
| Lower Barrack: | | | |
| 1 - - - | 6 | 4 | 2 |
| 2 - - - | 6 | 4 | 2 |
| 3 - - - | 6 | 4 | 2 |
| 4 - - - | 6 | 4 | 2 |
| 5 - - - | 6 | 4 | 2 |
| 6 - - - | 6 | 4 | 2 |
| 7 - - - | 6 | 4 | 2 |
| Total - - | 114 | 74 | 40 |

The rooms are at present considerably overcrowded ; but, owing to the exposed position of the buildings, it is not necessary to give the full allowance of 600 cubic feet per man in these rooms. We have, therefore, in the above table required less than the full amount ; but the numbers per room which we have laid down are the maximum numbers the rooms ought to contain.

Should it be considered necessary to keep up the full complement of 114 men, it would be possible to extend the accommodation on the higher level.

None of the rooms are ventilated. They each require a shaft carried up from the ceiling to above the roof, an inlet for air, and a remodelled grate to heat part of the inflowing air in winter. We consider these remodelled grates as being essential parts of the ventilating arrangements in so exposed a position ; and we would advise their being put up at the same time as the shafts and inlets.

The attic rooms in the upper barracks are very close, and might be improved by carrying the ceiling in the line of the roof to give more space overhead. The staircase in these barracks also requires ventilation by perforated glass panes, and by a shaft carried up through the top ceiling to above the roof. Several barrack-room windows do not open at top. All should be made to do so.

Each non-commissioned officer's room should have an Arnott's ventilator put into the chimney.

The rooms are lighted with candles. There is gas laid on at no great distance from the castle, and it should be introduced into the rooms.

There is no ablution-room at the upper barrack. At the lower barrack there is a room, the back wall of which is the rock ; this room is used as an ablution-room and women's wash-house. It is very dark, but might be improved and converted into a proper ablution-room, with one bath, which would be sufficient bath accommodation for the whole barracks. An ablution-room is required for the upper barrack. There are two cook-houses, with boilers, but without ovens. A ventilated roasting oven is required for each.

The water supply is derived from the rainfall on the roofs, which is collected in underground tanks. The amount of water obtained in this way is quite insufficient for supplying the garrison. Indeed, during two months of the present year all the water had to be obtained from the wells in Dumbarton, and carted to the Castle.

It has been stated to us that the town of Dumbarton is being supplied with water by gravitation from the neighbouring hills, and when this supply has been obtained it should be conducted to the castle.

The means of drainage for all the barracks are ample, but the privies are notwithstanding in a noxious condition, and the accommodation is not sufficient for the force. When a sufficiency of water is laid on we would advise that all of them should be enlarged and reconstructed as water latrines on Macfarlane's principle, and drained into the river Clyde. Proper urinals should also be put up.

The guard-room requires ventilation and warming by a shaft and remodelled grate. There is a cell under the barrack-rooms of the upper barrack totally unfit for human occupation. It appears to be little if at all used, and should be struck off the construction.

The guard-room should have better means of warming and ventilation.

*The Sanitary Improvements required for Dumbarton Castle are as follows :—*

1. Reduction of the number of men in each barrack-room to the extent shown in the table.
2. Ventilation of the rooms by shafts, inlets, and remodelled grates. Ventilation of the upper barrack staircase by a shaft and perforated panes. Lower barrack staircase to have perforated panes in the windows. Non-commissioned officers' rooms to have Arnott's ventilators in the chimneys. Guard-room to have a shaft and remodelled grate. All windows to be made to open at top.
3. A ventilated gas-burner to be introduced into each barrack-room.
4. An ablution-room, with tables, basins, &c., to be provided for the upper barrack. The ablution room in the lower barrack to be properly walled, lighted, and fitted up, and one bath with water laid on to be provided.
5. Cook-houses to be provided with a roasting oven each, and to be properly ventilated.
6. Town water to be introduced as soon as possible.
7. All the privies to be reconstructed as water latrines on Macfarlane's principle, with proper divisions, half-doors, light, and ventilation, and drained. Urinals to be reconstructed and supplied with water.

*Dumbarton Castle Hospital.*

As already stated, this hospital is a small house on the south side of the Castle rock near its base. The building was not originally intended for a hospital, and affords little else than a certain amount of house room for sick. It is two stories high, and contains four wards, a small kitchen, and a surgery seven feet long by three feet wide. There is no accommodation for orderlies, and there is no hospital serjeant's room, a ward being misappropriated for the serjeant's use.

The wards are all of a size, namely, 14 feet long, 10 feet 6 inches broad, and 9 feet high. The total accommodation is for 12 beds, with 332 cubic feet per bed, being the smallest amount of space allowed in any hospital we have visited. The following is the accommodation per ward :—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | Hospital / Serjeant | — | — |
| 2 | 4 | 1 | 3 |
| 3 | 4 | 1 | 3 |
| 4 | 4 | 1 | 3 |
| Total - | 12 | 3 | 9 |

Each of the wards should contain one bed and no more. There is no ventilation, but, with one bed per

ward, this defect could be sufficiently remedied by an Arnott's silk flap ventilator placed in each ward chimney, and by a Sherringham's ventilator through the wall, close to the ceiling.

There are no means of bathing, and there is no ablution-room.

There is no hospital wash-house.

The kitchen is imperfectly supplied with the means of cooking, and requires a range, with an oven.

There is no water-closet, and patients have to make use of an open privy over the river.

There is no storeage of any kind. If sick are to be treated within the precincts of the castle some more suitable provision should be made for them. There is very little level ground on which to extend the buildings, but some further accommodation might be obtained in the way of extension. In such a case all that can be done is to make the most of what facilities there may be available, and to trust to ventilation for keeping the wards healthy.

We would recommend :—

1. That it be considered to what extent the ward space could be enlarged by additions to the building.

2. That the present wards be ventilated by Arnott's ventilators, and by a Sherringham's ventilator in each, and that a window be opened in the back wall of each ward. That the stair be ventilated by a shaft through the roof, and that perforated panes be put into the passage and stair windows.

3. That an oven be added to the kitchen.

4. That the present privies be converted into water latrines.

Lastly. That it be considered whether in the event of an extension of the hospital being carried out, accommodation, however limited, might not be found for an ablution table and bath, and for the hospital serjeant.

## IX. FORT AUGUSTUS.

This fort is situated on an angle of land, bounded on the north side by the waters of Loch Ness, and on the west side by the Caledonian Canal. The position is low when compared with the surrounding country, but it is freely exposed to the winds, and ought to be healthy.

The barrack buildings are placed in the square of the fort, and consist of four blocks, with the parade ground between them. They are two stories high, with an attic above. Three of the blocks are appropriated as men's rooms, the hospital, &c., and the fourth for officers' quarters, &c. There are 18 men's rooms and 10 attics, with regulation accommodation for 166 men, with from 433 to 497 cubic feet per man, arranged as follows :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| No. 1 House, 8 rooms, (Nos. 1 to 8) | 56 | 48 | 8 |
| Attics, (Nos. 1, 2, 3, 4) | 16 | 12 | 4 |
| No. 2 House, Rooms Nos. 1 and 2 | 14 | 12 | 2 |
| Attics Nos. 1 and 2 | 8 | 6 | 2 |
| No. 3 House, 8 rooms, (Nos. 1 to 8) | 56 | 48 | 8 |
| Attics, (Nos. 1, 2, 3, 4) | 16 | 12 | 4 |
| Total - - | 166 | 138 | 28 |

By the present construction each barrack-room has seven men, and each attic room four men. By removing one man out of each room and attic, the remaining men will have less than 600 cubic feet per man, but the space afforded would be sufficient in so airy a situation.

The men's rooms are of old construction. They are placed back to back, and have only one small window each. With three exceptions the floors are of brick. They are entered from central passages and stone staircases. The passages are paved with cobble stones. The whole barrack is out of repair. It is worthy of consideration whether it is necessary to retain it for public uses ; if so, the buildings should be put in a tenantable and healthy condition. The passages should be flagged, and all the rooms properly floored and otherwise improved. None of the rooms are ventilated, and each room should have a shaft and inlet of the usual construction. The fire-grates are very old and wasteful. In such a climate remodelled grates would be specially useful.

These barracks were built 125 years ago, and we have been informed that no improvements have been made in them since that date.

They are destitute of the most ordinary conveniences.

There are no store-rooms, school-room, day-room, nor library. There are no lavatories, baths, nor wash-houses.

There is no kitchen or cook-house, and all the cooking has to be done with pots on the barrack-room fires.

There is no cleaning-room, drill-shed, nor workshop, and there is no accommodation for married non-commissioned officers nor soldiers.

Water is obtained from wells. It is stated to be good, and, from the local position of the fort, it could be increased to any required extent.

The privies are placed round a central shaft at one angle of the fort, and are drained into Loch Ness. If it be determined to retain the fort, these privies should be reconstructed as water latrines on Macfarlane's principle, and urinals should be attached to them. The whole of the fort drainage should be at the same time examined and revised.

The guard-room is dark and unventilated.

*Hospital, Fort Augustus.*

The hospital consists of five rooms, two downstairs, and three upstairs in an attic, all in a dilapidated state. The downstairs rooms have brick floors.

There is no accommodation for sick except these rooms. There is neither kitchen, surgery, serjeants' room, ablution-room, bath, nor water-closet. In fact, there is nothing of a hospital except the name.

Fort Augustus is not fit for occupation in its present state, and we do not think it necessary to make any specific recommendations regarding it.

The whole construction should be at once revised, if the buildings are to be retained ; and in revising the construction, the sanitary defects we have mentioned above should be removed.

## X. ABERDEEN BARRACKS.

There are two barracks at Aberdeen ; one for infantry, situated within the town, and the other in a small fort on the sea shore.

### 1. Infantry Barracks.

These barracks are situated at the eastern extremity of the city of Aberdeen, on an elevated plateau of gravel 2 A. and 30 P. in extent ; the buildings are arranged in the form of a letter E, of which the central block is composed of officers' quarters. In front the barracks overlook the port, but behind and close to the buildings is a neighbourhood of inferior houses, densely populated. The site is lofty and exposed to the sea breeze, and ought to be healthy.

The men's rooms are in three floors over a deep basement, which is used for cook-houses, ablution-rooms, &c.

On each floor two barrack-rooms open out on either

side of the central passage and staircase. The rooms are back to back, with the fireplace at the end opposite the door. There are circular openings between the rooms, and a circular opening from every room into the staircase and passage. The rooms are all of one size, namely, 25 feet 3 inches long, 20 feet wide, and 9 feet 3 inches high. None of them have more than two windows, and each room has regulation space for 12 men, with 390 cubic feet per man.

The following table shows the present regulation accommodation in comparison with what it could be at 600 cubic feet per man :—

| Rooms. | Total present Regulation Accommodation. | Total Accommodation for 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| No. 1 Barrack, 10 rooms - | 120 | 80 | 40 |
| No. 2 Barrack, 12 rooms - | 144 | 96 | 48 |
| No. 3 Barrack, 12 rooms - | 144 | 96 | 48 |
| No. 4 Barrack, 12 rooms - | 144 | 96 | 48 |
| Total - | 552 | 368 | 184 |

If all the barrack-rooms were occupied by troops they would, according to present regulation, hold 552 men in a space sufficient only for 368 men, showing an excess of 184 men, or 50 per cent.; but it appears that 13 of those rooms are used for school-rooms, library, serjeants' quarters, staff quarters, stores, &c., so that the available space for men consists of 33 rooms, accommodating, according to existing regulation, 396 men in a space sufficient for 264 men, at less than 600 cubic feet per man. This overcrowding is in no way compensated for, either by the structure or present ventilation of the barrack; but we consider that with proper ventilating arrangements each room may in so airy a position be set apart for 8 men, instead of 12, the present number.

Most of the rooms have Arnott's ventilators, but they are not sufficient to renew the air, and they have been closed to prevent smoke. The windows slide sideways, a form of construction not well adapted for ventilation. The fire-grates are of the old pattern. Five of the rooms have berths for serjeants. All the rooms have cupboards. All require to be properly ventilated by shafts and remodelled grates to warm the air admitted, and the existing openings through the partition walls between the rooms should be closed. It would be very advisable to provide one inlet for fresh air for each room close to the ceiling, over the window, provided an inlet could be easily made, but if not, the openings into the passages and stairs might be used as inlets, provided a board were placed over them to throw the inflowing air current up towards the ceiling. The upper panes of the passage and staircase windows should be formed of perforated glass, which would complete the ventilation of the stairs. Outlet shafts from the top of the stairs through the roof already exist.

All the barrack-rooms have gas.

The ablution-room is in the basement. The floor of it is of stone, sloped towards a gutter in the centre, and there are benches at the sides. The tables have no beads. Water is laid on. There are gratings to stand on. There are no pegs, and no baths.

These deficiencies ought to be supplied. If *all* the barrack-rooms were occupied at eight men per room, as recommended above, four baths with water laid on would be required.

The cook-houses are in the basement; they are tolerably light, and have brick ovens, recently erected. The boilers are of the ordinary pattern.

Neither cook-houses nor ablution-rooms are ventilated; and, as they are under men's rooms, shafts a foot square should be carried up from them to above the roof.

The serjeant's mess is in a soldier's room; it requires an Arnott's ventilator. There is no mess kitchen.

The women's wash-house is in the basement; it is dark, but might be improved in this respect by a Chappuis' reflector against the windows. It has no fixed tubs, and no drying nor laundry stove, and is too small. It would be much better to remove the wash-house from its present position altogether, and to reconstruct it, with the necessary implements, outside the barrack buildings.

The library is a barrack-room allotted to the purpose; it is also used as a reading room and lecture room for instruction in musketry. It has an Arnott's ventilator, but requires the same kind of ventilation as the barrack-rooms.

The school-room also requires to be ventilated in the same manner.

There is no infant school-room in the barracks, a hired room outside being used for the purpose.

The privies are of the ordinary construction, but the soil falls into a deep receptacle, from which it is flushed out into the drains. There is neither light nor ventilation to the buildings except by the door. They should be reconstructed with a shallow receptacle, on Macfarlane's principle, in which water should stand always, and with divisions of seats, half-doors, adequate light, and ventilation through the roof.

The ash-pit is too large; it has no cover. The ashes are thrown in through a square opening in a wall.

It should either be abolished, and a cart substituted; or, if this be impracticable, the ash-pit should be filled up above the level of the ground, and the surface paved and drained. It should be covered over, and a hopper and sliding door fitted to it. Another large ash-pit near the stable should be abolished altogether. It is quite unnecessary.

The stable has, it is stated, been condemned. It is in a confined situation, but the building, if properly repaired and adapted, might be used for a serjeants' mess and mess kitchen.

The canteen is a small defective building in a corner behind the barrack. The tap-room, and non-commissioned officers' room, which is partitioned off from the tap-room, require an Arnott's ventilator to improve the ventilation. The guard-room is under one end of the west wing of the barracks. It requires a shaft for ventilation, and the grate to be remodelled to warm the air admitted. It has a urinal, but no latrine. Additional light is also required.

The cells are ventilated and warmed by a stove in the passage. There is no cook-house, no latrine, and no quarters for the provost serjeant.

This barrack is deficient in many points, and these deficiencies have to be supplied by misappropriating a number of men's rooms, and overcrowding the remainder. It is unsuited for a depôt battalion, and only fit for a four company depôt in its present condition. It has been proposed to extend it on ground which, we are informed, could be obtained on the west side.

The following are the sanitary improvements required for the present buildings :—

1. Reduction of the regulation number of men from 12 men to 8 men per room.

2. Ventilating every barrack-room by a shaft carried from the ceiling to above the roof, and, if possible, by an inlet near the ceiling of each room, or by converting the opening from the staircase into an inlet as described. The grates to be remodelled to warm part of the admitted air. Circular openings in the partition wall between the rooms to be closed. Additional ventilation to be given to the staircase by perforated glass panes in the windows. Serjeants'

mess to have an Arnott's ventilator. Library and school-room to be ventilated like the barrack-rooms.

3. Ablution-rooms to have beads to the tables, pegs, and four baths ; and to have shafts carried up through the roof for ventilation.

4. Cook-houses to have shafts carried up from the ceiling to above the roof.

5. Women's wash-house, if possible, to be removed, and reconstructed out of the barrack buildings, or to be improved as suggested.

6. Privies to be reconstructed as water latrines, on Macfarlane's principle, with divisions of seats, half-doors, light, and ventilation. Proper urinals, supplied with water, to be constructed at the same time.

7. Ash-pit near the stable to be abolished. The other ash-pit to be removed if possible, or to be filled up, paved, drained, and covered in as described.

8. Canteen tap-room to be ventilated by Arnott's ventilators.

9. Guard-room to be ventilated by a shaft and remodelled grate,

*Aberdeen Barrack Hospital.*

This building is situated within an enclosure, separate from the barrack, and divided from it by a public street. It is open and airy to the front, but the back is bounded by a close neighbourhood of unhealthy houses, and by an offensive lane, in which are stables for horses and cattle, the ground in front of which was covered with manure heaps at the time of our inspection.

These nuisances ought to be abated, as no doubt they can be by enforcing the law.

The hospital has two stories and a basement, which, on account of the slope of the ground, is open to the back.

The surgery and pack and provision store are placed in the basement on one side, and on the other side are the serjeants' room and kitchen. A central passage and staircase of stone, with wooden landings, divides the building into two parts. There are two water-closets downstairs at the back of the passage, and two over them on the half landing. The two upper water-closets require ventilation by a shaft and perforated panes in the side windows. On the ground floor and first floor there is a ward on each side of the central passage.

This hospital contains several good points of construction well suited for regimental purposes. It has four wards, all of equal size, and arranged symmetrically on each side of the staircase. There are three windows on each of the opposite sides, with the beds ranged between them, but there are no orderlies' rooms, and the attendants have to sleep among the sick. This defect, however, is not inherent in the plan.

There are in all four wards, with regulation space for 40 sick, with from 626 to 766 cubic feet per bed. The following table shows the details of this :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Accommodation in Bed Spaces. |
|---|---|---|---|
| 1 | 10 | 7 | 3 |
| 2 | 10 | 6 | 4 |
| 3 | 10 | 5 | 5 |
| 4 | 10 | 6 | 4 |
| Total - | 40 | 24 | 16 |

In order to accommodate 24 sick in the proportion per ward given above it will be necessary to allow considerably less than 1,200 cubic feet per bed. But 24 beds is the maximum number these wards ought to contain.

Each ward has a chimney shaft at either end. All the windows open at the bottom, but some do not open at the top ; this should be remedied. One of the chimney shafts should, if possible, be changed into an outlet foul-air shaft, by closing the fireplace, and making an opening near the ceiling into the shaft of double its sectional area. The opening should be covered with a grating. If this cannot be done, a shaft should be provided through the roof at one end of the room, as recommended for the barrack-rooms. The grate should be remodelled to warm the air admitted.

In the lower wards there are hollow beams with openings at each side. These beams would make good inlets for fresh air if the sides were fitted with louvres sloped upwards to throw the air entering up towards the ceiling. The upper wards have openings in the ceiling into the roof. From one of these openings a shaft should be carried above the roof, and the others should be closed. Each of these upper wards should have two inlets for air, one on each of the opposite sides, close to the ceiling. The wards are lighted with gas, but the burners are not ventilated. The central staircase should have a louvre through the roof for ventilation.

The kitchen is under a ward. It requires ventilalation by a shaft and perforated panes of glass in the windows. It is provided with an oven.

There is an ash-pit in the yard, in a position where it is not required. It should be abolished, and means should be provided for the daily removal of refuse.

The wash-house has no fixed tubs, no gratings, and no means of drying linen. It has a louvre in the roof.

There are no privies in the back yard. There is no bath or ablution room. Space for these might be obtained by removing the two lower water-closets, but to enable this to be done a water latrine would have to be constructed in the yard. In the front part of the hospital there is a shed for exercise.

Water is derived from the town supply, and is abundant and good.

This hospital is not sufficiently extensive for a recruiting depôt. Besides the deficiencies mentioned above, it has no provision nor pack store. It has no room for examining recruits, and there is no itch ward, with a suitable bath, although many recruits arrive at the station suffering from this disease. In fact, it requires to be enlarged to make it sufficient for the wants of the station.

In so far as concerns the present buildings, *the following are the sanitary improvements requisite* :—

1. Reduction of the number of beds per ward to the extent stated.

2. Ventilation of the wards by shafts, inlets, and remodelled grates. All the ward windows to be made to open at top. Ventilation of the staircase by a louvre through the roof. Ventilation of the kitchen by a shaft and perforated glass panes.

3. Ash-pit in the yard to be removed.

4. Wash-house to be fitted up.

5. Upper water-closets to be ventilated by shafts and perforated panes.

6. A bath room with one bath, and an ablution table, both with hot and cold water laid on, to be provided.

7. Gas-burners, to be ventilated by funnels and tubes into the chimney.

2. The Fort.

The Fort is about half a mile from the barracks. It is placed a little above the sea beach, and commands the entrance to the harbour. It contains two rooms similar in construction, one at each end, and is intended to accommodate 40 men. The rooms have small ventilators near the ceiling, capable of being closed ; these should be altered to inlets like Sherringham's, and should be always open or grated. The fire-grates should be remodelled to warm the air admitted ; the loopholes should have perforated glass panes ; and perforated glass should be placed in the lobby door.

The ablution-room is not properly fitted up, and has no bath.

The privy empties into a cesspit. A repectacle on Macfarlane's principle should be made, with provision for the daily removal of the refuse, or for discharging it through a drain into the sea. No cesspit should be permitted in such a locality.

There is no guard-room; the master gunner's room is used for one.

This fort was not quite finished when we inspected it. In so open and airy a situation, and with so small a number of men, we should not advise much outlay, except what is absolutely necessary. The following improvements will be sufficient:—

1. Giving the men on all ordinary occasions, as nearly as may be 600 cubic feet per man.

2. Improving the ventilation by having the inlets permanently open, by Arnott's chimney ventilators, and by perforated panes in the windows. Fire-grates to be remodelled.

3. Cesspit to be abolished, and the privy to be reconstructed as a water latrine, on Macfarlane's principle, and drained to the sea, or its contents removed daily by a cart, as is done at Glasgow.

## XI. DUNDEE BARRACKS.

These barracks are situated on a hill, on the north side of Dundee, at a considerable elevation, and about a mile from the River Tay. They stand within an enclosure five and a half acres in extent, and are completely isolated from the buildings of the town. They resemble in structure an old Scottish mansion-house with turrets at the angles. The buildings occupy two sides of a square. They were erected in the year 1760, except the officers' quarters and hospital, which were erected in 1796 and 1797. The buildings are four stories in height, with a basement, and they are all of stone.

The men's rooms are in two sets, one of which is reached by a hanging stair, the other by a spiral staircase. There are 11 rooms occupied by soldiers, and the total present regulation accommodation is for 299 men, disposed as follows:—

| Rooms. | Present Regulation Number of Men. | Number of Men at 1,200 Cubic Feet each. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| 1 | 29 | 20 | 9 |
| 2 | 28 | 16 | 12 |
| 3 | 36 | 22 | 14 |
| 4 | 31 | 16 | 15 |
| 5 | 28 | 13 | 15 |
| 6 | 34 | 23 | 11 |
| 7 | 28 | 16 | 12 |
| 8 | 38 | 20 | 18 |
| 9 | 27 | 17 | 10 |
| 10 | 8 | 8 | — |
| 11 | 12 | 3 | 4 |
| Total | 299 | 179 | 120 |

It will be seen from this table that the rooms are considerably overcrowded. One of them gives no more than 296 cubic feet per man, and all the others, except two, give under 400 cubic feet.

In one small eight-men room only is the space a little above 600 cubic feet. It is stated to us that the rooms are hardly ever occupied up to the regulation number. It would be better, however, to prevent overcrowding by reducing the numbers on the construction than to trust to such a contingency. Considering the exposed position of the barrack we have in the preceding table allotted less than 600 cubic feet per man, and 179 men is the largest number for which there is healthy accommodation in the rooms.

The rooms vary from 45 to 60 feet in length, and from 23 to 26 feet in breadth, and their height varies from 7 feet 8 inches to 8 feet 2 and 9 feet 8 inches. All the rooms, except one or two, have windows on opposite sides, varying in number from four to eleven per room. None of them have any means of ventilation, but these could be readily afforded in the following manner:—All the rooms, except Nos. 10 and 11, have a fireplace at each end, one of which could easily be dispensed with if the fire-grate of the other were remodelled to warm the fresh air admitted to the room. The other fireplace should then be built up, and the chimney shaft belonging to it might be made into a foul-air shaft, by simply making an opening into it double the sectional area of the flue, close to the ceiling. Rooms 10 and 11 would require ventilating shafts carried up from the ceiling to above the roof. Each room, except Nos. 10 and 11, would require four inlets for fresh air close to the ceiling, two on each side. These two rooms would each require one inlet. The staircases should be ventilated by inserting panes of perforated glass in the windows.

All the rooms are lighted with gas, but none of the burners are ventilated. Each burner should be provided with a proper ventilating funnel and tube into the chimney.

Out of each room, at one angle, a small turret-room opens. These are used as serjeants' quarters, for which some of them are not well adapted. Two or three of the smaller of these rooms would afford space for the erection of carefully-constructed water-urinals, on the plan on trial in the Wellington Barracks, and the urine tubs might be at once dispensed with.

The serjeants' rooms should have Arnott's ventilators put into the chimneys.

There is a library and a school-room. Both require ventilation by a shaft and inlets for air.

There is an ablution-room in the basement, furnished with slate tables, with beads and gratings, but there are no pegs, and no baths. Two baths, with water laid on, would be required for the reduced strength given in the preceding table. There is a small room opening out of the ablution-room, in which these baths might be placed.

Behind the barrack ranges there is an excellent detached cook-house, with eight boilers; but there are no other means of cooking. An oven is required.

The women's wash-house is also in a large detached building. It is deficient in means of washing and drying linen, and requires fixed tubs with water laid on, gratings for the feet, a drying and laundry stove, and a louvre in the roof for ventilation.

There is a sufficient water supply derived from the Dundee waterworks.

The natural facilities for drainage are ample; the existing sewers and drains are stated to be efficient, and all are trapped.

There are four privies in rear of the barracks, with ash-pits attached, into which they are drained. The whole arrangement is offensive and noxious, and should be discontinued as speedily as possible. The privies should be reconstructed as water latrines on Macfarlane's principle, with divisions, half-doors, light, and ventilation, and they should be properly drained. The ash-pits should be filled up to the level of the ground; one only should be retained for use. It should be paved, drained, and covered, and arrangements should be made for more frequent removal of the dust and ashes.

While the privies are being reconstructed, the urinals should be supplied with water for cleansing them.

The canteen is situated on the upper side of the parade ground. It is an indifferent building, and the keeper has no proper accommodation. There is no fireplace in the non-commissioned officers' room. The tap-room requires an Arnott's ventilator.

The guard-room requires ventilation through the ridge by a ventilator on Mackinnel's or Muir's principle. Behind the guard-room are the cells, which are warmed by the iron back of the guard-room firegrate. It will be necessary to remodel this firegrate to warm the air admitted to the guard-room, and in so doing part of the warmed air should be allowed to enter the cells.

Attached to the guard-room is a privy, ash-pit, and urinal. The ash-pit should be abolished, and a box substituted. One ash-pit is enough for the barrack, and the box should be emptied into it. The privy and urinal should be drained, and the former reconstructed as a water latrine on Macfarlane's principle.

*The following are the Sanitary Improvements required for Dundee Barracks:—*

1. Reduction of the number of men in each room to the extent stated.

2. Ventilation of each room by a shaft formed out of the spare chimney, and in rooms 10 and 11 by separate shafts. Inlets and remodelled grates to be also provided. Staircases to be ventilated by perforated panes in the windows. Ventilation of the non-commissioned officers' rooms, and the canteen tap-room, by Arnott's ventilators. Guard-room to be ventilated through the roof, and to have its grate remodelled to warm the air in the guard-room and cells, as described. Library and school-room to be ventilated by shafts and inlets. All the barrack-room gas-burners to be ventilated.

3. Ablution-room to be supplied with pegs. Two baths with water laid on to be provided.

4. A ventilated roasting oven to be put up in the cook-house.

5. Women's wash-house to have fixed tubs with water laid on, gratings to stand on, a drying and laundry stove, and roof ventilation.

6. Privies to be drained and reconstructed as water latrines with divisions, half-doors, light, and ventilation. Cesspits to be abolished. One ash-pit to be retained for the barrack, to be raised a little above the level of the ground, paved, drained, and covered. Urinals to be supplied with water.

*Dundee Barrack Hospital.*

The hospital of Dundee barracks is situated at the western extremity of the barrack enclosure, against the slope of the hill, part of which has had to be cut into in order to find space for the foundations. As a consequence of this circumstance the ground floor, which is on the level in front, is a basement behind with a deep sunk area.

The building is three stories high. On the lower floor are placed the stores, the hospital wash-house, and the kitchen. On the floor above is the surgery, and the serjeants' room is on the top flat.

There are four wards in this part of the building, and several rooms suitable for wards are cut off from it and entered by a separate staircase. These rooms are used for pensioners, although under the same roof as the hospital. This is an arrangement which ought never to be permitted in hospitals, and the best thing to do in the present case would be to make over the whole building for sick.

The following table shows the present ward space in comparison with what it would be at 1,200 cubic feet per bed :—

| Wards. | Present Regulation Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency of Bed Spaces. |
|---|---|---|---|
| 1 | 10 | 8 | 2 |
| 2 | 10 | 8 | 2 |
| 3 | 10 | 8 | 2 |
| 4 | 2 | 2 | – |
| Total - | 32 | 26 | 6 |

At a little more than 1,100 cubic feet per bed these wards will hold 26 beds; and, to afford this space, we would advise two beds to be at once removed from each of wards 1, 2, and 3.

Each of the larger wards has six windows, and are light and cheerful. They have ventilating beams in the ceilings, but will require shafts to carry off the foul air. One shaft should be carried from the ceiling of each of the larger wards, 1, 2, and 3, to above the roof, and the ventilating beams would then serve as inlets for fresh air, provided a louvred box were placed under each opening to throw the inflowing current towards the roof.

The small ward would be sufficiently ventilated by an Arnott's silk flap valve in the chimney, and a Moore's louvred pane in the window.

The wards are warmed by the old pattern grate, which should be remodelled to warm part of the admitted air in winter.

The passage and stairs should be ventilated by means of perforated glass panes.

Gas has been recently introduced into the wards, but the burners are not ventilated. Each burner should have a funnel, and a tube carried into the chimney.

The position of the hospital wash-house, within the building and under the sick wards, is decidedly objectionable, and it ought to be removed. It is the only place at present where the sick can have a bath.

We should advise a proper bath and ablution room to be provided, for which no doubt space could be obtained.

The kitchen is under a ward. It requires a shaft and perforated panes for ventilation. It has no oven. Perhaps the best manner of providing one would be to put up a proper kitchen range.

There is one water-closet on the first landing, in a projection built out behind. It requires better ventilation by side windows. This projection might be enlarged to find space for the bath and ablution room.

Besides the water-closet, there are two privies in the back yard. The drainage is stated to be received into a cesspit outside the boundary wall. The privies should be reconstructed and drained along with those of the barracks.

Water is obtained from the town supply, and is good and abundant.

*The following are the Sanitary Improvements required for Dundee Barracks Hospital:—*

1. Removing two beds out of each of the three larger wards.

2. Ventilating these three wards by shafts carried from the ceiling to above the roof; by converting the present ventilating beams into inlets as described; and by remodelling the fire-grates. Small ward to be ventilated by an Arnott's silk-flap valve and a Moore's louvred pane. Gas-burners to be ventilated.

3. Hospital wash-house to be removed outside the building.

4. Kitchen to be ventilated by a shaft carried from the ceiling to above the roof, and by perforated panes. A new cooking range to be provided.

5. A bath and ablution room, with hot and cold water laid on, to be provided by enlarging the projections behind the staircase. Ventilation of the water-closet to be more effectually cut off from that of the staircase.

6. Privies in the yard to be drained, and reconstructed on Macfarlane's principle.

## XII. PERTH BARRACKS.

There are two barracks in the city of Perth; one a cavalry barrack, which has been adapted for infantry, and known as Perth barracks; the other is called Victoria Street barracks, and is used for recruits and militia.

### 1. Perth Barracks.

This barrack is situated at the outskirts of the town, within an enclosure six acres in extent. It is isolated from buildings, except a few detached houses, sheds, &c., on the east and south-east sides; and as the position is higher than that of the town generally, there are sufficient means of natural drainage. The subsoil is clay. The buildings are of sandstone, and were erected in 1792–93.

Having been originally intended for cavalry, these barracks have the usual construction of cavalry barracks.

The enclosure is a long parallelogram, with the barracks at one end. They consist of three blocks, forming three sides of a square. The officers' quarters are in the centre block, and the men's rooms in the sides. The riding-school is placed behind, and the hospital is at the end of the enclosure furthest from the barrack-rooms.

The men's blocks are of the usual cavalry construction, having stables below, and rooms over them opening right and left out of a central passage or corridor, reached by two broad flights of stairs in each block.

All the stables have been converted into barrack rooms, except stalls for 48 horses. These rooms enter from the foot of the stairs, and run from front to back of the building. They have sliding windows at each of the opposite ends, but the rooms above have a window on one side only.

The lower rooms have regulation space for 26 men each, at 430 cubic feet per man, and the upper rooms hold 10 men each, with 392 cubic feet per man. There are in all 30 rooms, the details of the accommodation in which are given in the following table :—

| Rooms. | Total present Regulation Number of Men. | Number of Men at 600 Cubic Feet per Man. | Deficiency of Accommodation in Men. |
|---|---|---|---|
| Nos. 1 to 10 inclusive | 100 | 70 | 30 |
| Nos. 11 to 17 inclusive | 182 | 133 | 49 |
| Nos. 21 to 30 inclusive | 100 | 70 | 30 |
| - | 382 | 273 | 109 |

By allowing somewhat less than 600 cubic feet per man in all the rooms, these barracks will accommodate 273 men; and to do so, the regulation number of men per room should be reduced in the first and third series of rooms (those upstairs) from ten to seven men per room; and in each of ground-floor rooms in the second series (the stable rooms) from 26 to 19 men per room. We are of opinion that the numbers we have assigned are the maximum numbers which these rooms ought to contain.

Some provision has been made for ventilation by carrying a hollow beam through and through the ground-floor rooms from front to back, with openings into the room at the ceiling.

These beams might be used as inlets for fresh air in the manner we have advised, with other similar arrangements, namely, the openings into the rooms should be enlarged to a sufficient sectional area, and protected by louvres, to throw the inflowing current up to the ceiling. An outlet shaft will be required besides. It should be carried up in an angle of the room, from the ceiling to above the roof.

The upper rooms are ventilated by openings in the ceiling into the roof. One of these openings should be connected with a louvred shaft carried above the roof. The other openings should be closed, and an inlet of the usual form and dimensions made through the outer wall.

The fire-grates in all the rooms are on the old pattern, and require to be remodelled to save fuel, and to warm part of the air admitted during winter.

The central passage between the upstairs rooms is lighted by a good skylight, and it is ventilated into the roof. The plan is not an efficient one, and we would advise that the ventilation be carried from the openings above the roof by means of one of Mackinnel's or Muir's ventilators. The passage windows should at the same time have perforated glass panes put into the window sashes.

The serjeants' quarters have no ventilation. An Arnott's silk flap ventilator should be put up in each.

There is a library in one of the end rooms; it requires ventilation and warming like the barrack-rooms. There are two fireplaces in the school-room, one of which might be disused if the fire-grate in the other were remodelled to warm part of the air admitted for ventilation. The disused chimney shaft might be easily converted into a foul-air shaft by making an opening into it double its sectional area close to the ceiling. An inlet for fresh air should also be made through the outer wall.

All the barrack-rooms are lighted with candles, although the passages are lighted with gas. We would advise a ventilated gas-burner to be introduced into each room.

There are three stables under the barrack-rooms. These require shafts carried up from the corners to above the roof. The shafts should have an aggregate area equal to 12 square inches per horse.

There are two ablution-rooms recently fitted up. They are in an outbuilding on the ground floor at the end of the entrance passage. The tables require ledges to prevent the water dashing over on the men, and there are no pegs.

There are no baths, but space could easily be found in the projecting buildings behind for two in each wing. They should have water laid on. In each wing of the barracks there is a cook-house on the ground floor of a projecting building. They are supplied with boilers, but up to the present time there are no ovens. This deficiency should be supplied.

A detached women's wash-house is placed on one side of the barrack square. It requires fixed tubs with water laid on, a drying and laundry stove, and a louvre for ventilation through the roof.

An abundant water supply is derived from Perth waterworks.

The surface drainage is imperfect from want of trapping of the drains, and there is no drainage for the privies. There are four of them, two on each side, connected with cesspits, which are also used as ash-pits, the whole contents being removed at intervals by the contractor. The privies are, besides, of very defective construction; they have not sufficient light and ventilation, and the urinals are placed under the same roof.

The whole require reconstruction as water latrines on Macfarlane's principle; they should have divisions of seats, half-doors, and sufficient ventilation and light through the roof, and their contents should be discharged into the town drains. Proper urinals should be constructed outside the latrines, and their contents disposed of in a similar manner.

The riding school of the former cavalry barrack is now used as a drill shed, for which it is very well adapted, except that it requires ventilation, which might be easily given by raising the ridge tiles; and more light should be admitted either by skylights or by opening out the back windows, which are at present blocked up.

There is a canteen, a one-story building, with two good tap-rooms; they are unventilated, and require

an Arnott's silk flap ventilator in the chimney of each room, and perforated glass panes in the windows. The tap-room has a large wasteful fire-grate, which might be remodelled with advantage to warm part of the admitted air.

These barracks have no day-room, and no workshops, except the cavalry forge, which is now used as an armourer's shop. They have no accommodation for married non-commissioned officers or soldiers.

There are no cleaning-rooms, because these rooms, of which there were four, have been diverted from their original use to form a serjeants' mess-room, a school-room, a regimental store, and a pensioners' armoury.

There is no serjeants' mess kitchen. It would be desirable to convert the store into a kitchen for this purpose.

The guard-room is not ventilated, and the only outlet for foul air is by a staircase into a room above it.

A proper shaft should be carried from the ceiling of the guard-room to above the roof. The fire-grate should be remodelled, and an inlet for fresh air of the usual form should be provided close to the ceiling.

*The following is a Summary of the Sanitary Improvements necessary for Perth Barracks:—*

1. Number of men in each ten-men room to be reduced from 10 to 7; and in each twenty-six-men room to 19.

2. Each of the barrack-rooms to be ventilated by a shaft and inlet for air, and by a remodelled grate, in the manner described. Corridors to have their ventilation improved by shafts carried through the roof, and perforated glass panes in the windows. Each barrack-room to have a ventilated gas-burner. Serjeants' quarters to have Arnott's silk flap ventilators in the chimneys. Library to have one of its chimney shafts converted into a ventilating shaft. The fire-grate in the other chimney to be remodelled, and an inlet for fresh air close to the ceiling to be provided. Guard-room to be ventilated by a shaft, inlet, and remodelled grate. Canteen tap-room and non-commissioned officers' room to be ventilated by Arnott's silk flap valves and perforated glass panes.

Stables to be ventilated by shafts from the corners carried above the roof. Riding school to be ventilated by raising the ridge tiles, and to have more light by skylights or windows.

3. Ablution tables to have ledges, and pegs to be put up in the ablution-rooms.

4. Four baths, with water laid on, to be provided.

5. Cook-houses to be supplied with ventilating roasting ovens.

6. Women's wash-house to have fixed tubs with water laid on; a drying and laundry stove, and ventilation through the roof.

7. Privies to be reconstructed on Macfarlane's principle, to be properly lighted and ventilated, and to be drained into the town sewers. Urinals to be reconstructed and drained. Cesspits to be filled up. The bottom of the ash-pit to be raised above the level, and to be paved and drained.

*Perth Barracks Hospital.*

This is a small hospital situated at the lower angle of the parade ground. It has no enclosure in front, and it is overlooked by some houses outside the boundary wall. The building is two stories high. On the ground floor there is a ward, a serjeants' room, and a nurses' room, used as a store; and above these rooms there are two wards and the surgery.

The total regulation accommodation is for 24 beds, at from 424 cubic feet to 629 cubic feet per bed.

The following table gives the details for each ward:—

| Wards. | Present Number of Beds. | Number of Beds at 1,200 Cubic Feet each. | Deficiency in Bed Spaces. |
|---|---|---|---|
| 1 | 10 | 6 | 4 |
| 2 | 10 | 6 | 4 |
| 3 | 4 | 2 | 2 |
| Total - | 24 | 14 | 10 |

The dimensions of the wards are such that it is impossible to give 1,200 cubic feet per bed, without leaving a considerable remainder or a considerable deficiency. We have preferred the latter course in the present case, as a temporary expedient, on account of the small size of the hospital in proportion to the barrack. It would be better, if practicable, to remove one bed more from each ward than we have required in the table; but the number of beds should on no account exceed those laid down; and the sooner the accommodation is extended the better will it be for the sick.
